ERRATA FOR VOLUME CXX OF THE OFFICIAL GAZETTE.

ANNOUNCEMENTS—VOLUME CXX.

DISCLAIMERS—VOLUME CXX.

TEXT OF THE OFFICIAL GAZETTE, JANUARY 2 TO FEBRUARY 27, 1906.

INDEX TO THE DECISIONS OF THE COMMISSIONER OF PATENTS AND OF THE UNITED STATES COURTS IN PATENT CASES.

DIGEST OF DECISIONS OF THE COMMISSIONER OF PATENTS AND OF THE UNITED STATES COURTS IN PATENT CASES.

INDEX OF PATENTS AND PATENTEES FOR THE MONTHS OF JANUARY AND FEBRUARY, 1906.

ERRATA.

800,128, page 222, in heading, residence of patentee, for "Ailey, Ala." read *Ailey, Ga.*

809,327, page 351, in heading, assignment, after the word "assignor" insert the words *of one-half.*

809,663, page 500, fifth claim, line 4, for the word "protecting" read *projecting.*

809,698, page 517, second claim, line 3, for the word "protected" read *protective.*

809,760, page 545, in heading, title of invention, for "Swingletree" read *Singletree.*

809,907, page 598, in heading, after residence of inventor, insert *assignor of one-third to John H. Allen, Chicago, Ill.*

810,303, page 834, in heading, assignment, name of assignee, for "Charles Malden-Ercale" read *Charles Malden-Ercole.*

810,377, page 870, in heading, after residence of last-mentioned patentee, insert *assignors, by mesne assignments, to The International Register Company, Columbus, Ohio, a Corporation of Ohio.*

810,577, page 1003, in heading, assignment, for "assignor of one-fourth to William P. Coffman and one-fourth to John I. Coffman" read *assignor of one-third to William P. Coffman and one-third to John I. Coffman.*

810,707, page 1055, in heading, assignment, for "assignors, by mesne assignments, of one-half to Bernard Siani," read *assignors, by direct and mesne assignment, of one-half to said Brazier and one-half to Bernard Siani.*

811,515, page 1424, in heading, after residence of patentee, insert *assignor to Joseph Middleby, Jr., Malden, Mass.*

811,863, page 1616, in heading, title of invention, for "Air-Brake" read *Car-Brake.*

812,211, page 1848, in heading, name of patentee, for "Constantin Künz" read *Constantin Kunz.*

812,279, page 1882, third claim, lines 2–3; fourth claim, line 2, and seventh claim, line 2, for the word "controlling" read *connecting.*

812,291, page 1927, in heading, residence of patentee, for "Montgomery" read *Montgomery City.*

812,731, page 2592, in heading, name of patentee, for "John Murmans" read *John Meermans.*

48,931, [(Trade-Mark,) page 897, in heading, residence of registrant, for "Philadelphia, Pa.," read *Camden, N. J.*

Amendments.

RULE 73. In every amendment the exact word or words to be stricken out or inserted in the application must be specified and the precise point indicated where the erasure or insertion is to be made. All such amendments must be on sheets of paper separate from the papers previously filed, and written on but one side of the paper. Erasures, additions, insertions, or mutilations of the papers and records must not be made by the applicant.

Regulations in Relation to Mail-Matter.

In order to insure the ready identification of the division from which mail-matter emanating from this Office was sent, and the prepayment of any foreign postage thereon, as well as to prevent the retention for general delivery in the post-office of the city of any wrongly-addressed letter when this Office could supply a fuller or more accurate address, it is directed that the following regulations be observed with reference to all mail-matter forwarded from this Office:

Each envelop forwarded from any division will be stamped or marked in the upper left-hand corner with the division number or letter, as the case may be.

Each envelop addressed to a foreign country must be forwarded to the mail-room and the proper stamps affixed thereto before mailing.

Such mail as is to be delivered in this city shall be directed "Washington, D. C." If a letter addressed to a person in this city and not marked for general delivery be returned to this Office, it will be promptly remailed with an accurate and full local address supplied, if possible. In remailing, the envelop should be marked or stamped "Held in General Delivery," but no envelop should be thus marked until the address thereon is as full and accurate as the Office can supply. A letter to a person in this city will not be filed "Unclaimed," until it is returned to this Office in an envelop thus addressed and marked.

APPLICATIONS UNDER EXAMINATION.

Condition at Close of Business December 26, 1905.

Room No.	Divisions and subjects of invention.	Oldest new application and oldest action by applicant awaiting office action. Amended	New.	No. of applications awaiting action.
	Under one month.			
128	II. Bee Culture, Dairy, Label-Affixers, Paper Files and Binders, Presses, Store-Service, Tobacco, etc.	Dec. 14	Sept. 18	227
134	XXXIII. Canes, Canopies, Cutlery, Domestic Cooking Vessels, Electricity, Medical and Surgical, Electric Signaling, Fireproof Buildings, Harness, Masonry, Tents, and Umbrellas.	Dec. 14	July 6	708
209	XVII. Linotyping, Printing, Matrix-Making, Nut and Bolt Locks.	Dec. 13	Sept. 22	312
202	XXXVI. Curtains, Shades, and Screens, Drafting, Driers, Measuring Instruments, and Wind-Wheels.	Dec. 12	Nov. 16	218
378	XXXVIII. Artesian and Oil Wells, Bottles and Jars, Care of Live Stock, Fishing and Trapping, Stationery, Stone-Working.	Dec. 12	Oct. 19	375
220	X. Carriages and Wagons.....	Dec. 9	Sept. 6	712
135	III. Annealing and Tempering, Coating with Metal, Electrochemistry, Metal-Founding, Metallurgy, Shaping Fluid Metal.	Dec. 8	Nov. 28	226
207	XXXVII. Electricity, Conductors, Lighting, Special Apparatus.	Dec. 8	Apr. 14	669
146	XXIV. Apparel, Apparel Apparatus, Sewing-Machines, Surgery, Toilet.	Dec. 7	Sept. 21	539
216	VI. Bleaching and Dyeing, Chemicals, Explosives, Fertilizers, Medicines, Preserving, Sugar and Salt.	Dec. 6	Oct. 18	308
197	V. Fine Arts, Bookbinding, Harvesters, Jewelry, and Music.	Dec. 5	Oct. 14	364
128	XXII. Air-Guns, Ammunition and Explosive Devices, Boats and Buoys, Catapults and Targets, Firearms, Marine Propulsion, Ordnance, Ships.	Dec. 5	Sept. 11	245
224	XXXIV. Railways, Railway-Bonding, Rolling-Stock.	Dec. 4	Nov. 6	385
203	XV. Bread, Pastry, and Confections, Making, Coating, Laminated Sheets and Fabrics, Fuel, Glass, Hydraulic Lime and Cement, Paper-Making, Paving, and Plastics.	Dec. 4	Oct. 19	396
124	XI. Boot and Shoe Making, Boots, Shoes, and Leggings, Button, Eyelet, and Rivet Setting, Leather Manufacturing, Nailing and Stapling, Check-Controlled Apparatus, Whips and Whip Apparatus.	Dec. 4	July 11	414
165	XXVI. Electricity, Generation, Electric Heaters, Electric Railways, Motive Power.	Dec. 4	June 19	650
205	I. Tillage, etc., Fences, and Railway Draft Appliances.	Dec. 1	Nov. 6	199
214	XXXV. Bandage, Dentists, Dutchmen, and Coin, Card, Picture, and Sign Exhibiting, Deposit and Collection Receptacles, Package and Article Carriers, Packing and Storing Vessels, Typewriting.	Dec. 1	Nov. 1	408
138	XVI. Telegraphy and Telephony..	Dec. 1	Oct. 30	215
218	XII. Elevators, Journal-Boxes, Lubricators, Machine Elements and Shafting.	Dec. 1	Sept. 20	433
[illegible]	[illegible]	Dec. 1	Sept. 18	226
[illegible]	[illegible]	Dec. 1	Sept. 8	272
[illegible]	[illegible]	Dec. 1	Aug. 28	630
[illegible]	[illegible]	Dec. 1	Aug. 26	883

Applications Under Examination—Continued.

Room No.	Divisions and subjects of invention.	Oldest new application and oldest action by applicant awaiting office action. Amended	New.	No. of applications awaiting action.
421	XXXII. Carbonating Beverages, Dispensing Beverages, Dispensing-Cans, Metallic Shipping and Storing Vessels, Packaging Liquids, Paper Receptacles, Refrigeration, Wooden Receptacles.	Dec. 1	Aug. 12	608
122	XIX. Stoves and Furnaces and Steam-Boiler Furnaces.	Dec. 1	June 15	629
112	XXI. Textiles, Carding, Knitting, Spinning, Weaving, etc.	Dec. 1	June 8	564
222	IV. Bridges, Conveyers, Cranes and Derricks, Excavating, Hoisting, Hydraulic Engineering, Loading and Unloading, and Towers.	Nov. 27	Nov. 27	249
312	VII. Velocipedes, Clutches, Fire-Escapes, Games and Toys, Ladders, Mechanical Motors, and Paper Manufactures.	Nov. 27	July 10	510
	Between one and two months.			
188	XXX. Fluid-Pressure Regulators, Lamps and Gas-Fittings, Type-Writing Machines.	Nov. 25	May 8	583
172	XXXI. Alcohol, Charcoal and Coke, Distillation, Gas, Heating and Illuminating, Hides, Skins, and Leather, Liquid Coating Compositions, Oils, Fats, and Glue, Water Purification.	Nov. 24	Nov. 9	222
307	XIV. Cutting and Punching Sheets and Bars, Farriery, Metal-Bending, Metal-Ornamenting, Metal Personal Wear, Making, Sheet-Metal Ware, Making, Tools, Wire-Working.	Nov. 10	Aug. 7	294
375	XXVII. Brushing and Scrubbing, Grinding and Polishing, Laundry, Washing Apparatus.	Nov. 9	July 13	549
179	XX. Artificial Limbs, Builders' Hardware, Dentistry, Locks and Latches, Safes, Undertaking.	Nov. 2	July 3	413
	Between two and three months.			
382	XXVIII. Air and Gas Engines, Air and Gas Pumps, Pneumatics.	Oct. 20	May 26	821
330	XIII. Arms, Projectiles, and Explosive Charges, Making, Metal-Working, Needle and Pin Making.	Oct. 5	Aug. 10	603
142	IX. Baths and Closets, Fire-Extinguishers, Hydraulic Motors, Pumps, Sewerage, and Water Distribution.	Sept. 26	June 6	1037
	Between four and five months.			
315	XXV. Butchering, Mills, Threshing, and Vegetable Cutters and Crushers.	Aug. 18	July 20	484
	Total number of applications awaiting action			17,288

189	TRADE-MARKS, DESIGNS, LABELS AND PRINTS.			
	Between one and two months.			
	Trade-Marks.....	Oct. 30	Oct. 11	4552
	Under one month.			
	Designs.....	Dec. 21	Dec. 5	42
	Labels and Prints.....	Dec. 21	Dec. 20	19

Trade-Marks.

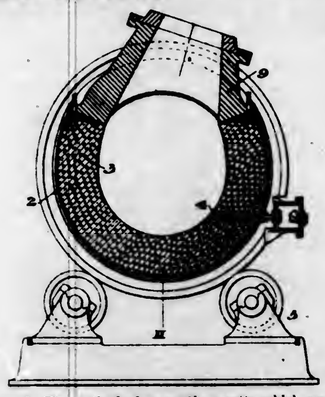
The publication of trade-marks under the act of February 20, 1905, in the OFFICIAL GAZETTE, commenced May 2, 1905, and will appear in each weekly number of the GAZETTE thereafter.

Extra copies of the trade-mark portion of the GAZETTE, which will be sold separately, may be obtained single or in quantities for five cents each. Coupons will be taken in payment therefor.

PATENTS

GRANTED JANUARY 2, 1906.

808,618. **METHOD OF CONVERTING MATTE.** CHARLES M. ALLEN, Lolo, Mont., assignor to Ralph Baggaley, Pittsburg, Pa. Filed Jan. 23, 1905. Serial No. 242,255.



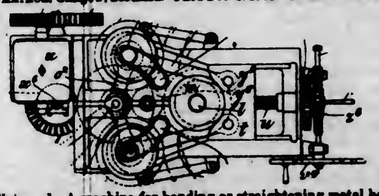
Claim.—1. The method of converting matte which consists in bessemerizing it in a vessel having a non-siliceous interior, and thereafter transferring it into an acid-lined vessel and bessemerizing it; substantially as described.

2. The method of converting matte which consists in bessemerizing it in a basic-lined vessel up to practically the grade of white-metal, thereafter transferring it into an acid-lined vessel and bessemerizing it to blister-copper; substantially as described.

3. The method of converting matte which consists in bessemerizing in a converting vessel a charge of molten matte until it reaches substantially the grade of white-metal, then transferring it to a smaller converter and finishing the bessemerizing therein; substantially as described.

4. The method of converting matte which consists in bessemerizing in a converting vessel having a non-siliceous interior, a charge of molten matte until it reaches substantially the grade of white-metal, then transferring it to a smaller silica-lined converter and finishing the bessemerizing therein; substantially as described.

808,619. **MACHINE FOR BENDING METAL BARS, &c.** WILLIAM S. ARTHUR, Glasgow, Scotland. Filed Dec. 1, 1904. Serial No. 234,902.



Claim.—1. A machine for bending or straightening metal bars and beams comprising; in combination, a frame, three rollers carried by the frame, one of the rollers being fixed in position and the other two being movable about a common center which center does not coincide with the axis of the fixed roller, means for revolving the three rollers and means for moving the two movable rollers.

2. A machine for bending or straightening metal bars and beams comprising, in combination, a frame, three rollers carried by the frame, one of the rollers being fixed in position and the other two being movable radially about a common center which center is in line with the axis of the fixed roller but does not coincide with said axis, means for revolving the three rollers and means for moving the two movable rollers.

3. A machine for bending or straightening metal bars and beams comprising, in combination, a frame, three rollers carried by the frame, one of the rollers being fixed in position and being intermediate of the other two rollers which are movable radially about a common center which center is in line with the axis of the fixed roller and coincides with the center of a shaft, means for revolving this shaft, means whereby the rotary movement of the shaft is communicated to the two movable rollers and also to the fixed roller and means for moving the two movable rollers radially about their common center.

4. A machine for bending or straightening metal bars and beams comprising, in combination, a frame, three spindles in the frame, rollers on the spindles, means for revolving the spindles, a slide, links for connecting two of the spindles to the slide, a screw, worm-gear for operating the screw and means for operating the worm-gear, substantially as described.

5. A machine for bending or straightening metal bars and beams comprising, in combination, a frame, three spindles in the frame, rollers on the spindles, means for revolving the spindles, a slide, links for connecting two of the spindles to the slide, a screwed spindle connected with the slide, a worm-wheel on the screwed spindle, a worm-shaft and a hand-wheel for operating the worm-shaft, substantially as described.

6. A machine for bending or straightening metal bars and beams comprising, in combination, a frame, three spindles in the frame, rollers on the spindles, means for revolving the spindles, a slide, links for connecting two of the spindles to the slide, a screwed spindle connected with the slide, a worm-wheel on the screwed spindle, a worm-shaft, a hand-wheel on the worm-shaft, means whereby the worm-shaft can be thrown out of gear, and a handle on the worm-wheel, substantially as described.

7. A machine for bending or straightening metal bars and beams comprising, in combination, a frame, three spindles in the frame, rollers on the spindles, means for revolving the spindles, two slides, links for connecting two of the spindles to the slides, two screwed spindles, toothed wheels on each spindle, an intermediate pinion, and worm-gear for driving one of the screwed spindles, substantially as described.

8. A machine for bending or straightening metal bars and beams comprising, in combination, a frame, three rollers carried by the frame, one of the rollers being fixed in position and the other two being movable radially about a common center which center is in line with the axis of the fixed roller but does not coincide with the said axis, spindles for the rollers, a shaft whose axis coincides with the common center of the two movable rollers, means for rotating said shaft and gearing connected with the shaft and with the spindles of the rollers for the purpose of revolving the same, curved guides for guiding the movable rollers and means for moving the movable rollers about their common center and near to or away from the fixed roller.

9. A machine for bending or straightening metal bars and beams comprising, in combination, a frame, three vertical spindles in the frame, rollers on the spindles, a vertical shaft, means for rotating the shaft, means whereby the rotation of the shaft is communicated to the spindles, links connecting two of the spindles to the shaft, a slide, links connecting the said two spindles to the slide, and means for moving the slide, substantially as described.

10. A machine for bending or straightening metal bars and beams comprising, in combination, a frame, three spindles in the frame, a flanged roller on each spindle, a cap on the roller, a spring

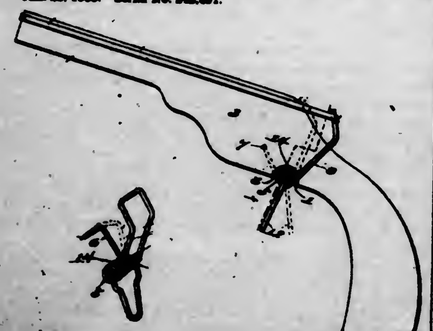
bearing on the cap, a screw for adjusting the position of the cap, means for revolving the spindles, a slide, links for connecting two of the spindles to the slide, and means for moving the slide, substantially as described.

808,620. **TUBE-DRAWING APPARATUS.** GEORGE RAMER, McKeesport, Pa., assignor to National Tube Company, Pittsburg, Pa., a Corporation of New Jersey. Filed Sept. 17, 1904. Serial No. 224,894.

Claim.—1. In apparatus for forming tubing, the combination of drawing mechanism, and means for actuating said mechanism, said actuating means being arranged to run at two substantially constant speeds and to automatically change from the one speed to the other by the drawing strain.

2. In apparatus for forming tubing, the combination of drawing mechanism, and means for actuating said mechanism, said actuating means being arranged to run at two substantially constant speeds and to automatically change from the one speed to the other by the drawing strain, and manually-operated means for varying the higher speed.

808,621. **TOY PISTOL.** FRANKLIN M. BALL, Falls Church, Va. Filed Jan. 25, 1905. Serial No. 242,691.



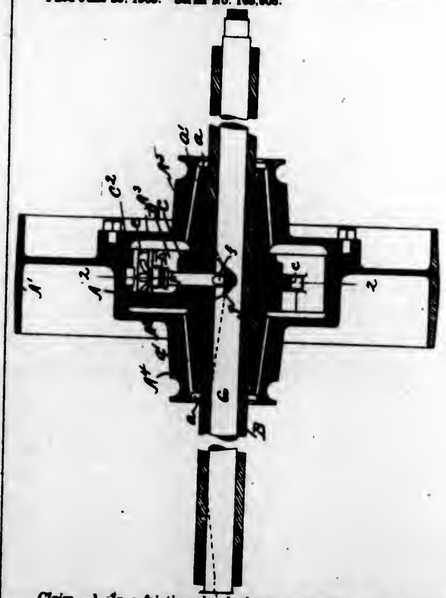
Claim.—1. A device for operating elastic bands of toy pistols, comprising a single piece of wire having a coil-spring, a portion of the wire extending from each end of the coil over the piston to form a holding-arm, said wire portion being extended from the coil ends and looped below the pistol to form a trigger.

2. A device for operating elastic bands of toy pistols, comprising a single piece of wire having a coil-spring, an anchor projecting from the coil, a holding-arm extending above the coil, and a trigger depending from the coil.

3. A device for operating elastic bands of toy pistols, comprising a single piece of wire having a coil-spring, a holding-arm extended over the coil, a trigger depending from the coil, a fulcrum-eye at one end of the coil, and an anchor projecting from the coil.

4. In a toy pistol, the combination, with an elastic band adapted to be cast from the pistol, of a device for operating the band, comprising a single piece of wire having a coil-spring through which one end of the wire extends to form a fulcrum-eye, an anchor formed by the other end of the wire, a trigger looped below the coil, and arms projecting from the coil and extending forwardly over the coil to form a band-holding arm.

808,622. **FRICTION-CLUTCH.** FRANK H. BALL, Plainfield, N. J. Filed June 20, 1903. Serial No. 162,608.



Claim.—1. In a friction-clutch the combination of an annular friction-surface a split friction-ring adapted to act on said surface; a carrier for said split ring, the ends of said ring having a limited circumferential movement on said carrier; and mechanism for actuating the free end of the ring to set the clutch, each end of the ring being adapted to become either the driving or free end according to the direction of movement of the clutch the ring being driven with a clutch moving in one direction from its end.

2. In a friction-clutch, the combination of an annular friction-surface, a split ring adapted to act on said surface, a carrier for said split ring the ends of said ring having a limited circumferential movement on said carrier, and mechanism for actuating the free end of the ring to set the clutch, each end of the ring being adapted to become either the driven or free end according to the direction of movement of the clutch, the ring being driven with the clutch moving in either direction from its end.

3. In a friction-clutch the combination of an annular friction-surface; a split friction-ring adapted to act on said surface; a carrier for said split ring, the ends of said ring having a limited movement on said carrier said ring being driven from its end; and a toggle-joint between the ends of the ring and arranged to actuate the free end thereof.

4. In a friction-clutch the combination of an annular friction-surface a split friction-ring adapted to act on said surface; a carrier for said split ring, the ends of said ring having a limited movement on said carrier said ring being driven from its end; a toggle-joint free to move with the ring arranged between the ends of the ring and adapted to actuate the free end thereof.

5. In a clutch the combination of a friction-surface; a split ring adapted to operate against said surface; a carrier for said split ring, said split ring being adapted to spring on the said carrier and to be normally free from the annular friction-surface, and said carrier having a projection extending between the ends of the split ring and adapted to form an abutment against either end of the split ring as said end may be the driving end of the ring; and means for actuating the free end of the ring.

6. In a clutch the combination of a friction-surface; a split ring adapted to operate against said surface; a carrier for said split ring, said split ring being adapted to spring on the said carrier and to be normally free from the annular friction-surface, and said carrier having a projection extending between the ends of the split ring and adapted to form an abutment against either end of the split ring as said end may be the driving end of the ring; means for actuating the free end of the ring; the hollow shaft B; the rod G having the cam-surface thereon in said shaft; the pin F extending from said cam-surface against the means for actuating the free end of the split ring.

7. In a friction-clutch the combination of a friction-surface A; the split ring D arranged to engage said surface; the carrier C on which said split ring is sprung, said carrier having the projection C^3 extending between the ends of the split ring; the toggle-joint E also extending between the ends of said split ring, said split ring with the toggle-joint having a limited movement on the carrier; the hollow shaft B on which said carrier is mounted; the rod G arranged in said hollow shaft and having a cam-surface thereon; and the pin F extending from said cam-surface against the toggle E.

8. In a friction-clutch, the combination with the driving member thereof having within itself a completely-inclosed oil-retaining clutch-cavity; a clutch mechanism arranged in said cavity; a hollow shaft on which said mechanism is mounted; and means within said shaft for operating said clutch.

9. In a friction-clutch, the combination of an annular friction-surface; a hub thereon forming with the friction-surface a clutch-cavity; a clutch device within said cavity, said clutch device being provided with passages extending from the outer part of the clutch toward the axis, the hub for the annular friction-surface being provided with passages leading from the inner part of the hub to the clutch-cavity.

10. In a friction-clutch the combination with an annular friction-ring having hubs for the same forming with the annular surface a clutch-cavity, said hubs being provided with passages leading from the inner part of the hub to the clutch-cavity; a clutch mechanism comprising a split ring; and a carrier therefor, said split ring and carrier being provided with passages in register leading from the ring through the carrier toward the axis of the clutch.

11. In a friction-clutch, the combination with the clutch members having friction-surfaces adapted to be brought into engagement; a shaft on which said members are mounted, one of said members being fixed on said shaft and the other journaled thereon, the member journaled on the shaft having passages leading from the shaft to the clutch-surfaces, and the member fixed on the shaft having passages leading from the clutch-surfaces to the shaft.

12. In a friction-clutch the combination with the friction-surface A; the hubs secured thereon, and forming with the friction-surface a clutch-cavity; the split ring D; the carrier C on which said split ring is sprung, said carrier having the projection C^3 between the ends of the carrier; means for actuating said split ring, said split ring and carrier being provided with the passages d^3 and c' through which oil passes by gravity; the rod B on which said carrier is fixed one of said hubs being provided with the grooves a and passages a' leading from the grooves a to the clutch-cavity whereby oil may be carried from the journal to the clutch-cavity by centrifugal force.

13. In a friction-clutch, the combination with the clutch members, one of which is loose relatively to the other when the clutch is released, said clutch mechanism comprising friction-surfaces adapted to be brought into engagement; an oiling device arranged to carry oil from the friction-surfaces toward the axis of the clutch mechanism by gravity, and to return it to the surfaces at the outer part of the clutch by centrifugal force after its passage through the bearing of the loose member whereby a circulation of oil through the loose member is accomplished.

808,623. **CARRIER FOR PNEUMATIC TUBES.** BENNET C. BATCHELLER, Philadelphia, Pa., assignor to The Pneumatic Tube and Power Company, New York, N. Y., a Corporation of New York. Filed Mar. 21, 1905. Serial No. 251,210.

Claim.—1. A pneumatic carrier having buffer-heads at its ends and a flat flexible disk of greater diameter than the buffers or than the tube in which the carrier is to travel, secured between one end of the carrier and the buffer at that end.

2. A pneumatic carrier having buffer-heads at its ends and a flat flexible disk of greater diameter than the buffers or than the tube in which the carrier is to travel secured between one end of the carrier and the buffer at that end, said buffer being rounded at C', to permit the edge of the disk to turn freely over it.

808,624. **SANITARY NAPKIN.** PERRY S. BAUER, Chicago, Ill., assignor to Bauer & Black, Chicago, Ill., a Corporation of Illinois. Filed Feb. 11, 1905. Serial No. 245,269.

Claim.—1. A sanitary napkin comprising an absorbent pad, a fabric holder inclosing said pad and sealed at the ends of the pad, and a strip of moisture-proof material interposed between one side of the pad and the holder to render the pad impervious to moisture at that side.

2. A sanitary napkin comprising an absorbent pad, a fabric holder inclosing said pad, and a strip of adhesive material interposed between one side of the pad and the holder and incorporated therewith to render the pad impervious to moisture at that side.

3. A sanitary napkin comprising an absorbent pad, a fabric holder inclosing said pad, and adhesive material interposed between one side of the pad and the holder and incorporated with the holder to seal the holder at the ends of the pad and render the pad impervious to moisture at that side.

4. A sanitary napkin comprising an absorbent pad, a fabric holder inclosing the pad, and adhesive material interposed between one side of the pad and the holder and extending beyond the ends of the pad and incorporated with the pad and the holder to render the pad impervious to moisture at that side.

5. A sanitary napkin comprising an absorbent pad, a fabric holder inclosing the pad, and a strip of gutta-percha tissue interposed between one side of the pad and the holder and extending beyond the ends of the pad, said strip being incorporated by heat and pressure with the pad and the holder to render the pad impervious to moisture at that side.

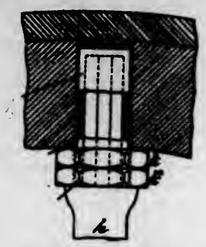
6. A sanitary napkin comprising an absorbent pad, a sheet of fabric folded upon and inclosing the pad with its edges overlapping and its ends extending beyond the ends of the pad, and a strip of adhesive material interposed between one side of the pad and the inclosing fabric to render the pad impervious to moisture at that side and incorporated by heat and pressure with the pad and the fabric to fasten together the overlapping edges of the fabric upon the pad.

808,625. **CONSTRUCTION OF WHEELS.** THOMAS R. BEARMONT, Park Place, London, England. Filed Nov. 29, 1904. Serial No. 234,778.

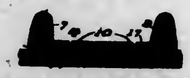
Claim.—1. In a wheel in which a segmental wooden felly is surmounted by a metal tire, a wedge-shaped plug between adjacent segments of the felly, removable adjustment-liners between the outer end of the plug and the tire, a bolt countersunk in the tire and threading the said liners and plug, and a nut on said bolt engaging over said plug; substantially as described.

2. In a wheel such as herein described in which the spoke-tenons are let into the felly, a loose non-rotatable cap closely surrounding the tenon and slipped over the end of the spoke, said cap extending inwardly beyond the inner periphery of the felly and being externally screw-threaded on its inner end for the reception of a tighten-

leg-cut adapted to engage the inner periphery of the felly and draw the crown of the cap against the end of the spoke; substantially as described.



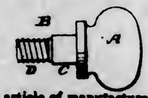
808,626. HORSESHOE. JAMES T. BELL, Washington, N. J. Filed Jan. 4, 1905. Serial No. 239,859.



Claim.—1. A horseshoe comprising a body portion and a toe-calk secured thereto, said toe-calk comprising a plate conforming in curvature to the curvature of the body portion and provided with side flanges to snugly fit the edges of the body portion throughout the length of the plate, calks projecting in spaced relation from said plate and arranged in alinement at right angles to the longitudinal dimension of the body portion, and duplicate securing means for attaching the plate to the body portion, the surface of the plate next the body portion being cut away at an incline from each securing means to the free end of the plate.

2. A horseshoe comprising a body portion and a toe-calk secured thereto, said toe-calk comprising a plate conforming in curvature to the curvature of the body portion and provided with side flanges to snugly fit the edges of the body portion throughout the length of the plate, calks projecting in spaced relation from said plate and arranged in alinement at right angles to the longitudinal dimension of the body portion, and duplicate securing means for attaching the plate to the body portion, the surface of the plate next the body portion being cut away at an incline from each securing means to the free end of the plate, the surface of the plate between the securing means resting squarely against the surface of the body portion.

808,627. KNOB. KRAFT BOOTH, Philadelphia, Pa., assignor to Gilinder & Sons, Inc., Philadelphia, Pa. Filed Apr. 10, 1905. Serial No. 254,697.



Claim.—1. As an article of manufacture a transparent drawer or door knob having an integral attaching-stem formed with means for preventing turning of the knob and also with means for the application of a device for securing the knob in place, substantially as described.

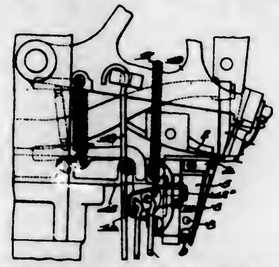
2. As an article of manufacture a transparent drawer or door knob having an integral attaching-stem which for a portion of its length is angular in cross-section to prevent turning, and also having a threaded portion for the application of a securing-nut, substantially as described.

808,628. ROUGH-ROUNDING AND CHANNELING MACHINE. WILLIAM S. BRADBURN, West Bridgewater, Mass., assignor to United Shoe Machinery Company, Paterson, N. J., a Corporation of New Jersey. Filed Mar. 6, 1905. Serial No. 248,446.

Claim.—1. A rough-rounding and channeling machine, having, in combination, a trimming-knife, a channeling-knife, a fore-part guide, and common means for throwing the fore-part guide into and the channeling-knife out of operation, substantially as described.

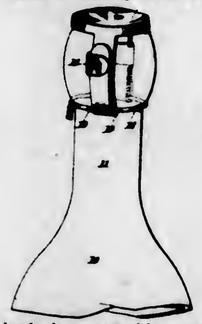
2. A rough-rounding and channeling machine, having, in combination, a trimming-knife, a channeling-knife, a fore-part guide, common means for throwing the fore-part guide into, and the channeling-knife out of, operation, and independent means for throwing the channeling-knife out of operation, substantially as described.

3. A rough-rounding and channeling machine, having, in combination, a trimming-knife, a channeling-knife, a fore-part guide, a channeling-knife guard, connected means for throwing the fore-part guide and channeling-knife guard into operation, substantially as described.



4. A rough-rounding and channeling machine, having, in combination, a trimming-knife, a channeling-knife, a fore-part guide, a channeling-knife guard, connected means for throwing the fore-part guide and channeling-knife guard into operation, and independent means for throwing the channel-knife guard into operation, substantially as described.

808,629. BOTTLE-CLOSURE. CLARENCE M. BRONSON and PHILIP F. KING, New York, N. Y. Filed Apr. 11, 1905. Serial No. 254,911.



Claim.—1. A bottle-closure comprising a cap, arms extending therefrom, means adapted to embrace a bottle-neck and said arms, and means for securing the free ends of said arms, substantially as specified.

2. A bottle-closure comprising a cap, arms extending therefrom, means adapted to embrace a bottle-neck and said arms intermediate their ends, and means for securing the free ends of said arms, substantially as specified.

3. A bottle-closure comprising a cap, arms extending therefrom, means adapted to embrace a bottle-neck, and said arms, and means arranged upon said arms adapted to engage and hold the free ends thereof, substantially as specified.

4. A bottle-closure comprising a cap, arms extending therefrom having their ends folded upon the remainder of said arms, a wire adapted to embrace a bottle-neck extending through said looped arms, and locking devices for engaging and holding the folded ends of said arms, substantially as specified.

5. A bottle-closure comprising a cap having a plurality of arms extending therefrom, having their ends folded upon the remainder of said arms, a wire adapted to embrace a bottle-neck extending through said looped arms, and locking devices arranged upon said arms adapted to engage and hold the folded ends of said arms, substantially as specified.

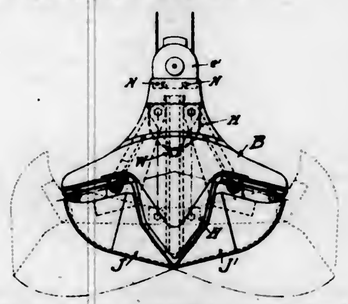
6. A bottle-closure comprising a cap having a plurality of arms extending therefrom, having their ends folded upon the remainder of said arms to form looped portions, a wire adapted to embrace a bottle-neck extending through the looped portions of said arms, and locking devices provided upon said arms intermediate the cap and looped portions adapted to engage and hold the free ends of said arms locked to their folded position, substantially as specified.

7. A bottle-closure comprising a cap having a plurality of arms extending therefrom having their ends folded upon the remainder of said arms to form looped portions, a wire adapted to embrace a bottle-neck extending through said looped portions, and laterally-projecting portions or ears upon said arms adapted to engage and hold the free ends of said arms to their folded positions, substantially as specified.

8. A bottle-closure comprising a dished cap having a plurality of arms extending therefrom having their ends folded upon the remainder of said arms to form looped portions, a wire adapted to embrace a bottle-neck extending through said looped portions, and laterally-projecting ears arranged upon the edges of said arms intermediate the dished cap and the looped portions of said arms, adapted to engage and hold the free ends of said arms locked to their folded positions, substantially as specified.

9. A bottle-closure comprising a dished cap having a plurality of arms extending therefrom having their ends folded upon the remainder of said arms to form looped portions, a disk of packing arranged in said cap, a wire adapted to embrace a bottle-neck extending through said looped portions, and laterally-projecting ears arranged upon the edges of said arms adjacent to the edge of said cap adapted to engage and hold the free ends of said arms locked to their folded positions, substantially as specified.

808,630. GRAB-BUCKET. ALEXANDER B. BROWN, Cleveland, Ohio, assignor to The Brown Hoisting Machinery Company, Cleveland, Ohio. Filed Aug. 8, 1905. Serial No. 273,302.



Claim.—1. A two-rope grab-bucket connectively related to its top block in such manner that the spread of the bucket-blades shall tend to coincide with or to be opposite to that of the strands of the hoist-rope as may be predetermined.

2. A two-rope grab-bucket detachably connected to its top block with the plane of the spread of the blades or jaws coincident with or opposite to that of the hoist-rope, substantially as shown and described.

3. The combination of a two-rope grab-bucket, having its top block rotatively connected with the sliding cross-head of the same, and suitable means of detachedly uniting said block and bucket together when the planes of the hoist-rope, and the bucket's jaws are either coincident, or opposite, substantially as shown and described.

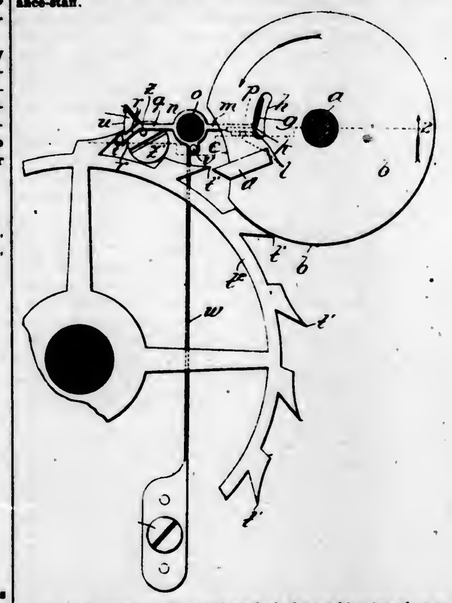
4. The combination of a two-rope grab-bucket and a top block connectively related to the cross-head of said bucket or to a separate hook or clevis, substantially as shown and described.

808,631. CHRONOMETER-ESCAPEMENT. AUGUSTUS BROWN, Elgin, Ill. Filed July 13, 1904. Renewed Nov. 13, 1905. Serial No. 282,089.

Claim.—1. An escapement of the class described in which is combined a balance-arm, a balance-staff, an unlocking-spring mounted upon the balance-arm substantially parallel with the balance-staff, an escapement-wheel, a detent interposed longitudinally between said spring and the locking-tooth of said wheel, and yielding means for maintaining said detent in a normal position.

2. The combination in an escapement of the class described, of a balance-staff, an escapement-wheel, a detent interposed longitudinally between the balance-staff and the locking-tooth of the wheel, the staff of which detent is in a line substantially tangential to the circumference of the wheel, a locking-jewel upon one end and an unlocking-jewel upon the opposite end of said detent, means for yieldingly maintaining said detent in a normal position, a balance-arm and an unlocking-spring mounted upon said balance-arm in position to engage said unlocking-jewel.

3. A chronometer-escapement in which is combined a balance-staff, a balance-arm mounted thereon, an escapement-wheel having teeth adapted to act as locking-teeth, a pivoted detent interposed longitudinally between said balance-staff and such one of said locking-teeth as may be in immediate proximity thereto, means for yieldingly maintaining said detent in a normal position, a locking-jewel upon one end of said detent in position to successively engage said locking-teeth, an unlocking-jewel upon the opposite end, and a flat unlocking-spring having one end thereof attached to the balance-arm, said spring being arranged substantially parallel to the balance-staff.



4. In a device of the class described, the combination of an escapement-wheel, a pivoted detent, a balance-staff, a balance-arm mounted upon said balance-staff, and an unlocking-spring mounted upon the balance-arm parallel to said balance-staff and adapted to oscillate therewith.

5. In a device of the class described, the combination of an escapement-wheel having teeth upon its periphery adapted to act as locking-teeth, a balance-staff, a pivoted detent having its body located in a line substantially tangential to the circumference of the wheel, a balance-arm, an unlocking-spring mounted upon the balance-arm, a locking-jewel upon one end and an unlocking-jewel upon the other end of said detent, the former being normally in the path of movement of said teeth and the latter in the path of movement of the unlocking-spring.

6. In a device of the class described, the combination of an escapement-wheel, a pivoted detent, a balance-staff, a balance-arm thereon, a roller having a curved slot therein, said slot being concentric with the axis of the balance-staff, and an unlocking-spring having one end attached to the balance-arm, said spring being extended through said slot with the edges in normal contact with the outer edge of the slot.

7. In a device of the class described, the combination of an escapement-wheel, a pivoted detent, a balance-staff, a balance-arm mounted thereon, a roller having a curved slot therein, the curve of which is concentric with the axis of the balance-staff, and a wide flat unlocking-spring having one end attached to the balance-arm, said spring being extended through said slot, which serves as a banking therefor, the lower or contact portion of said spring being cut away from one edge, whereby but a single contact or interference can occur between the spring and the unlocking-jewel with each oscillation of the balance-arm.

8. In a device of the class described, the combination with a balance-staff, a balance-arm thereon, an escapement-wheel and an unlocking-spring mounted on the balance-arm, of a pivoted detent having arms of substantially equal length, a locking-jewel, and an

unlocking-jewel, said locking-jewel being upon one end and said unlocking-jewel upon the other end of said detent.

808,632. HOISTING-MACHINE. WILLIAM M. BROWN, Gibsonburg, Ohio. Filed June 9, 1905. Serial No. 264,389.

Claim.—1. In a hoisting-machine, a mast having telescoping sections, means for longitudinally adjusting said sections, and means for automatically locking the sections in adjusted position when strain is applied to the top section, said means being adapted to permit the sections to have a relative turning movement to adjust the top section to the line of pull of the hoisting-cable before locking the sections in adjusted position.

2. In a hoisting-machine, a mast comprising relatively adjustable telescoping sections, means for adjusting the sections, and means coacting with the opposing surfaces of the sections for automatically locking the sections in rigid adjusted position when a hoisting strain is applied to the top section.

3. In a hoisting-machine, a sectional longitudinally-extensible mast, means for extending the mast adapted to permit the top section to adjust itself to the line of pull of the hoisting-cable, and means operated by the strain on the top section for causing the sections to be locked in adjusted position and against independent rotary movement.

4. In a hoisting-machine, a mast comprising a base-section and a movable top section, means for elevating the movable section adapted to permit it to adjust itself to the line of pull of the hoisting-cable, and means actuated by a lowering movement of the top section for locking it both in elevated position, and adjusted position relative to the line of pull of the hoisting-cable.

5. In a hoisting-machine, a mast comprising a plurality of telescoping adjustable sections, and means inclosed within the sections and operated from without the same for causing an adjustment thereof said means comprising an element fixed within the lower section and projecting within the upper section and a cable operating on said element and in connection with the upper section whereby a tightening thereof causes the top section to be elevated.

6. In a hoisting-machine, a mast comprising a plurality of telescoping adjustable sections, means inclosed within the sections and operated from without the same for causing an adjustment thereof, and means coacting with the opposing surfaces of the sections for automatically locking the sections in adjusted position.

7. In a hoisting-machine, a mast comprising a hollow base-section and a top telescoping section, an elevating-pole inclosed within the base-section, and projecting within the top section, a cable supported by said pole and having connection with the lower end of the top section whereby a tightening thereof causes said top section to be elevated.

8. In a hoisting-machine, a mast comprising a hollow base-section and a top telescoping section, an elevating element fixed within the base-section and projecting within the top section, a cable supported by said element and having connection with the lower portion of the top section whereby the top section is permitted to turn within the lower section and be elevated by a shortening of said cable.

9. In a hoisting-machine, a mast comprising a plurality of telescoping sections, means for adjusting said sections, and means for locking the sections in adjusted position, said means comprising a tapered member fixed to the upper end of each inclosing section, a movable gripping member suspended above said fixed member and having a tapered surface to coact with the tapered surface of the fixed members whereby to cause the inclosed section to be gripped on a slight lowering movement thereof, and trip means associated with said movable gripping member.

10. In a hoisting-machine, a sectional telescoping mast, means for adjusting the sections thereof, and means for locking the sections in adjusted position, said means comprising a collar fixed to the upper end of the inclosing section and having its inner surface partially tapered, a movable member suspended above said collar having a serrated mast-engaging surface and a tapered surface for coacting with the tapered surface of said collar whereby to cause it to grip the inclosed section as it is lowered, and a yoke from which said movable member is suspended having means whereby a release of said member with the inclosed section may be effected.

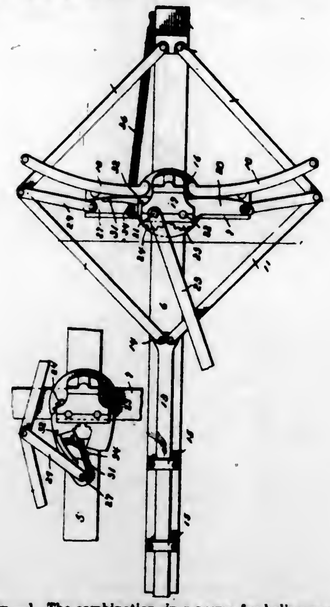
11. In a portable hoisting-machine, a vehicle-frame, a mast having pivotal connection with said frame whereby it may be placed in reclining or erect position, and means to which said mast is pivoted adapted to be moved to cause a movement of the mast longitudinally of the vehicle-frame.

12. In a machine of the class described, a vehicle-frame, members mounted to have a movement longitudinally of said frame, means for causing such movement, and a mast having pivotal connection with said members whereby it may have an adjustment longitudinally of the vehicle-frame.

13. In a hoisting-machine, a mast comprising longitudinally-adjustable telescoping sections, one section being permitted to turn within the other, means for effecting a longitudinal adjustment of the mast-sections, and means for automatically locking the sections against relative turning and longitudinal movements when a lowering strain is applied to the top section.

14. In a machine of the class described, a vehicle, racks mounted at one end and movable longitudinally of the vehicle-frame, means for imparting movement to said racks, and a mast pivoted to the outer ends of said racks whereby it is permitted to have a movement longitudinally of the vehicle-frame or be placed in reclining or erect position.

808,633. HAY-PRESS POWER. WARREN S. BRYANT, Adhall, Tex., assignor of one-half to C. C. Dockery, Cameron, Tex. Filed Sept. 29, 1904. Serial No. 226,567.



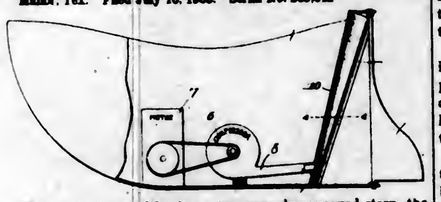
Claim.—1. The combination, in a power for baling-presses, of a toggle connected to the plunger, a shaft to which the power is applied, having a ratchet thereon, a cylinder around the ratchet and connected to the toggle-arms, and having a pawl engageable with the ratchet, and means to disengage the pawl.

2. The combination, in a power for baling-presses, of a pair of opposite toggles connected to the plunger, a shaft to which the power is applied, having a ratchet thereon, a pair of meshing gears having arms connected to the respective toggles, one of the gears being mounted around the ratchet and having a pawl engageable therewith, and means to disengage the pawl.

3. The combination, in a power for baling-presses, of a shaft to which the power is applied, having a ratchet thereon, a cylinder extending around the ratchet having an arm connected to the plunger of the press and a pawl engageable with the ratchet, means to disengage the pawl, and keys which may be inserted in the notches of the ratchet, to prevent the pawl engaging therein.

4. The combination, in a power for baling-presses, of a reciprocating plunger, a rotary shaft, and connecting means between the shaft and plunger to convert the rotation of the former into strokes of the latter, including a pawl and ratchet, and means to prevent the engagement of the pawl with part of the ratchet-teeth, to vary the number of strokes delivered during each rotation of the shaft.

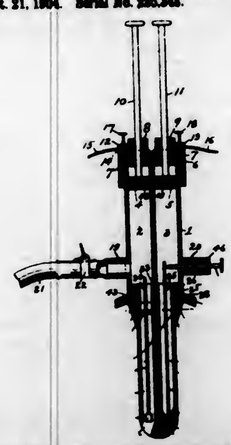
808,634. VESSEL-PROPELLING DEVICE. PERY CARLSON, Manor, Tex. Filed July 10, 1905. Serial No. 269,012.



Claim.—1. A vessel having a transversely-concaved stern, the side walls of the vessel being extended rearward to form flanges at the opposite sides of said concaved stern, said flanges being arranged on convergent lines that taper from the upper portion of the stern to a point of convergence adjacent to or below the keel, a discharge-port formed in the stern at a point adjacent to the keel, and means for forcing a stream of compressed air through said port.

2. A vessel having a transversely-concaved stern, the side walls of the vessel being extended to form flanges at the opposite sides of the stern, said flanges being arranged on tapered lines toward a point of convergence adjacent to or below the keel, a port arranged in the stern of the vessel, means for forcing a stream of compressed air through said port, and a rudder mounted aft the concaved stern, and in the vertical plane of the keel, substantially as specified.

808,635. APPARATUS FOR TREATING DISEASED TISSUES. ANTONINO CIOLFI and ROLLAND A. CASE, Cleveland, Ohio, assignors to The American Specialty Company, Cleveland, Ohio, a Corporation. Filed Sept. 21, 1904. Serial No. 225,343.



Claim.—1. In an apparatus for treating diseased tissues, the combination of a casing having two compartments therein, an electrode for each of said compartments, connections between each of said electrodes and a source of electric energy, and means for introducing an electrolyte into said compartments, one of said compartments having an opening for the discharge of the liberated gas adjacent to the tissue to be treated.

2. In an apparatus for treating diseased tissues, the combination of a casing having two compartments therein, an electrode for each of said compartments, connections between each of said electrodes and a source of electric energy, and means for introducing an electrolyte into said compartments, one of the compartments having an inclined outlet to permit the liberated gas to more readily contact with the tissue adjacent thereto.

3. In an apparatus for treating orificial diseases, the combination of a casing having therein two compartments, an electrode for each of said compartments, a piston for introducing an oxygen-producing electrolyte into said compartments and the orifice to be treated, the compartment for one of said electrodes having an outlet adapted to discharge the liberated gas into the orifice to be treated, and means for supplying electric current to said electrodes.

4. In a syringe, the combination of a pair of cylinders, a piston in each of said cylinders, each of said cylinders being provided with an extension, an electrode for each of said extensions, one of said extensions having an outlet, and means for supplying electric current to said electrodes.

5. In a syringe, the combination of a body portion having therein a pair of cylinders, pistons for said cylinders, a tip for said body portion having therein two compartments communicating with said cylinders, an electrode for each of said compartments having an outlet near the end of said trip, and means for applying electric current to said electrodes.

6. In a syringe, the combination of a body portion, having therein a pair of cylinders, pistons for said cylinders, a tip for said body portion having therein two compartments communicating with said cylinders, an electrode for each of said compartments, one of said compartments having an outlet near the end of said tip, and means including said pistons for supplying electric current to said electrodes.

7. In a syringe, the combination of a casing having therein a pair of cylinders, a tip secured to said casing and having therein compartments or channels communicating with said cylinders, pistons in said cylinders, and electrodes removably fitted in the compartments of said tip.

8. As a means for treating orificial diseases, a syringe having in combination a casing, said casing having a pair of cylinders therein, a tip secured to said casing, said tip being provided with a tapered portion adapted to fit the external portion of the orifice to close the same and having therein compartments or channels communicating with said cylinders, and electrodes fitted in said compartments or channels.

9. As a means for treating orificial diseases, a syringe having in combination a casing, said casing having a pair of cylinders therein, a tip secured to said casing, said tip being provided with a tapered portion adapted to fit the external portion of the orifice to close the same and having therein compartments or channels communicating with said cylinders, and pistons in said cylinders.

10. A syringe for the treatment of orificial diseases comprising a pair of cylinders, a piston for each of said cylinders, an extension common to said cylinders and having adjacent its point of connection with said cylinders a rounded tapered surface adapted to fit and close the orifice to be treated and being provided with channels communicating with said cylinders.

11. A syringe for the treatment of orificial diseases, said syringe comprising a casing having therein a pair of longitudinally-extending cylinders, pistons in said cylinders, a tip or extension secured to said casing and having therein channels communicating with said cylinders, said tip having a tapered portion adapted to fit the external portion of the orifice to be treated and a flange at the enlarged end of said tapered portion to limit the penetration of said tip.

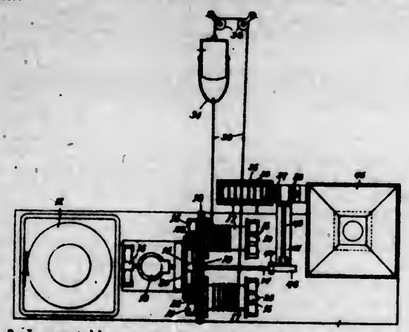
12. A syringe for the treatment of orificial diseases comprising a casing having a pair of cylinders therein, pistons for said cylinders, an extension or tip for said casing having channels communicating with said cylinders, the discharge ends of said channels being outwardly inclined, said syringe having a rounded tapered portion adapted to engage and close the external portion of the orifice to be treated.

808,636. EXCAVATOR. FRANK F. COLLATH, Milwaukee, Wis. Filed June 11, 1904. Serial No. 212,978.

Claim.—1. In a portable excavator, a movable platform, a motor carried thereby, a pair of winding-drums driven by the motor, cables wound upon the winding-drums, a scoop connected to the cables, an anchored pulley at a distance from the platform around which one of the cables passes, a receptacle carried by the platform into which the scoop is adapted to be discharged, a conveyer for lifting the material from the receptacle, an elevated hopper into which the conveyer discharges, and a valve for the hopper through which the contents thereof may be discharged into any suitable vehicle.

2. In a portable excavator, a movable platform, a motor carried thereby, a pair of winding-drums driven by the motor, cables wound upon the winding-drums, a scoop connected to the cables, an anchored guide-pulley at a distance from the platform around which one of the cables passes, a receptacle carried by the platform into which the scoop is adapted to be emptied, a conveyer for lifting the material from the receptacle and operated by the motor, an elevated

hopper into which the conveyer discharges, and a spout for the hopper adapted to discharge the contents thereof into any suitable vehicle.



3. In a portable excavator, a movable platform, a motor carried thereby, a pair of winding-drums operated from the drive-shaft of the motor, means for connecting the winding-drums with the drive-shaft of the motor alternately, cables wound upon the winding-drums, a scoop connected to the cables, a guide-pulley suitably anchored at a distance from the platform around which one of the cables is passed, a receptacle carried by the platform, a drum journaled therein, a chain conveyer carried by the drum, buckets on the chain conveyer, a sprocket-wheel supported from the platform at an elevation and by which the chain conveyer is driven, a pulley mounted on the shaft of the sprocket-wheel, a pulley on the drive-shaft of the motor, a belt connecting said pulleys, an elevated hopper into which the conveyer is adapted to discharge, and a valved spout therefor capable of discharging the contents of the hopper into any suitable vehicle.

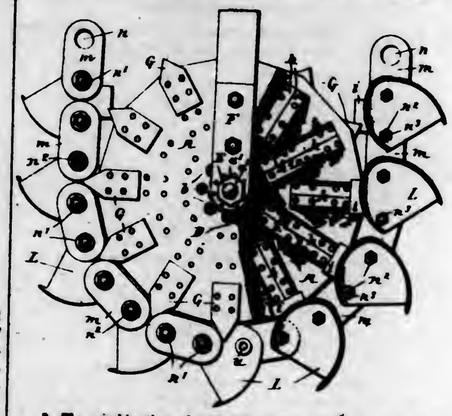
4. In a portable excavator, a pair of winding-drums, cables wound upon the drums, a scoop connected to the cables, a guide-pulley anchored at a distance from the drums and around which one of the cables passes, a motor, a pinion on the shaft thereof, a pair of gear-wheels meshing with the pinion, friction-shoes in slots of the gear-wheels, and means for forcing the friction-shoes of each winding-drum into frictional engagement therewith comprising sleeves slidable on the shafts of the winding-drums, links connecting said sleeves with the friction-shoes, screws threaded in the shaft-bearings for sliding the sleeves on the shafts, levers connected with the screws by which said screws may be turned, and a link connecting the levers whereby the friction-shoes of one drum are released as the friction-shoes of the other drum are brought into active engagement with said drum.

5. In a portable excavator, a platform mounted on wheels, a boiler carried thereby, a steam-engine mounted on the platform and supplied with steam by the boiler, a pinion on the drive-shaft of the engine, a pair of gear-wheels meshing with the pinion, a pair of winding-drums, friction-clutches between the winding-drums and the gear-wheels, means for connecting the drums alternately with their gear-wheels, cables wound upon the drums, a scoop connected to the cables, a guide-pulley suitably anchored at a distance from the platform and around which one of the cables is passed, a receptacle carried by the platform into which the scoop is adapted to be emptied, a conveyer adapted to lift the material from the receptacle, a shaft suitably mounted at an elevation from the platform and adapted to drive the conveyer, a pulley on said shaft, a pulley on the drive-shaft, a belt connecting said pulleys, a hopper supported from the platform at an elevation into which the conveyer is adapted to discharge, and a valved adjustable spout on the hopper for discharging the contents thereof into any suitable vehicle.

808,637. ELEVATOR MECHANISM. WILLIAM CROMBLEY, West Haven, Conn. Filed Jan. 19, 1903. Serial No. 139,741.

Claim.—1. The combination of a chain of link-connected conveyer-scoops, provided at their ends with bearing-seats, a rotatable sprocket-drum comprising a pair of disks, a hub connecting the disks, forming the shaft-support thereof, a series of carrier-teeth secured to the outer faces of the disks and a series of brackets secured to the inner faces of the disks, adapted to engage with the bearing-seats of the scoops, substantially as and for the purpose specified.

2. In sprocket-drum construction the combination of the disks, a hub connecting the disks, a series of carrier-teeth on the outer faces of the disks, and the series of angle-iron bars secured to the inner faces of the disks to form brackets for engaging the scoops of a conveyer-chain, substantially as and for the purpose specified.

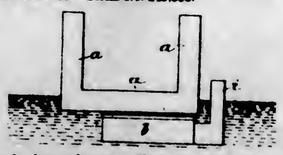


3. The combination of a sprocket-drum comprising a pair of disks connected by a hub or shaft, a series of brackets arranged on the inner faces of the disks, a series of carrier-teeth arranged on the outer faces of the disks, a series of scoops adapted to fit and be conveyed between the disks of the sprocket-drum provided with bearing-seats to engage the brackets of the disks and having a pair of cylindrical bosses or journals at their ends in the traveling plane of the carrier-teeth of the drum, a series of links received on the journals of the scoops connecting them in an endless conveyer-chain, and means for holding the links in place on their journals substantially in the manner, and for the purpose specified.

4. In a sprocket-drum for a chain of conveyer-scoops the combination of the disks A the hub D having the oil-reservoir *f* and connecting the disks, a shaft received through the hub, the carrier-teeth *g* arranged on the outer faces of the disks and the brackets h arranged on the inner faces thereof substantially as and for the purpose specified.

5. In a dredging-machine or digger the combination with a sprocket-drum for conveying a chain of scoops, and the holding arms or frames for supporting the drum, of a shaft secured in the frames and having the drum mounted thereon, the collars *r* mounted on the shaft between the drum and frame and secured respectively to said parts, and a divided case or band *t* having its sections clamped upon and inclosing the collars to form a water-tight joint between the drum and its stationary supports, substantially in the manner and for the purpose specified.

808,638. FLOATING CAISSON FOR REPAIRING FLOATING DRY-DOCK BOTTOMS. ANDREW C. CUNNINGHAM, Annapolis, Md. Filed Mar. 10, 1905. Serial No. 249,206.

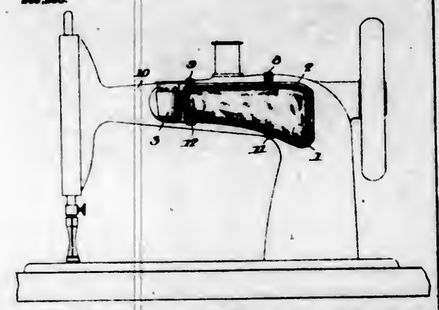


Claim.—1. An under-water-floating caisson for repairing the bottoms of floating dry-docks, the same comprising an open-topped working chamber having a bottom and closed on all sides, said chamber being adapted to be entirely submerged and floated under the dock, and provided with means for exhausting the water therefrom, and having a shaft extending above water to permit workmen to enter the chamber after it is in place.

2. An under-water-floating caisson for repairing the bottoms of floating dry-docks, the same comprising an open-topped working chamber having a bottom and closed on all sides, said chamber having a supplemental flotation-chamber and means for admitting and exhausting water from said flotation-chamber.

3. An under-water-floating caisson for repairing the bottoms of floating dry-docks, the same comprising an open-topped working chamber having a bottom and closed on all sides, a supplemental flotation-chamber, means for admitting water to the flotation-chamber to give the working chamber the required submersion, means for exhausting the water from the flotation-chamber to cause the open top of the working chamber to fit water-tight against the bottom of the dock, and means for exhausting the water from the working chamber to permit the workmen to enter and work therein.

808,639. IMPLEMENT-HOLDER FOR SEWING-MACHINES. MARTHA J. DAVIS, St. Joseph, Mo. Filed July 11, 1905. Serial No. 269,235.



Claim.—1. In a sewing-companion, a plate, clasps carried upon the plate, means whereby the clasps may be adjusted relative to each other, and an implement-holder mounted upon the plate.

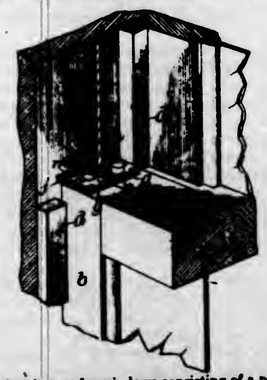
2. In a sewing-companion, a plate, clasps carried upon the plate, means whereby the clasps may be adjustably moved longitudinally of the plate and an implement-holder mounted upon the plate.

3. In a sewing-companion, a plate, a strip upon the plate, a clasp adjustably secured to the plate by a strip and an implement-holder mounted upon the plate.

4. A sewing-companion, a plate, a plurality of clasps mounted upon the back of the plate, means for adjusting the clasps relative to each other and an implement-holder mounted upon the plate.

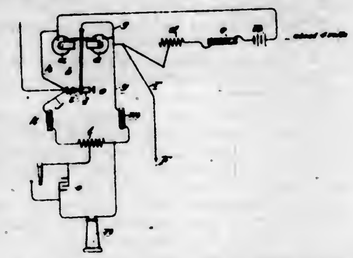
5. A sewing-companion, a plate, a penetrable material secured to the front of the plate, a thimble-socket secured to the front of the plate, a strip mounted upon the back of the plate, a plurality of clasps secured to the back of the plate by the strip and means for adjusting the clasps relative to each other and to the plate.

808,640. AIR-STOP FOR WINDOWS. WILLIAM A. DAVIS and WILLIAM H. SARELIUS, Chicago, Ill. Filed Feb. 18, 1905. Serial No. 246,200.



Claim.—An air-stop for windows consisting of a plate provided with tongues or tangs and a slot or aperture extending from the middle of the rear edge to about the central portion thereof, a fabric piece held by said tongues or tangs provided with a slit coincident with said slot or aperture of said plate for accommodating the counterbalancing means whereby when the plate is screwed in position a continuous unbroken reinforced fabric edge is presented to the frictional wear against the jamb and guides of the window and the slit in the rear edge of said fabric is closed by compression as herein described.

808,641. WIRELESS TELEGRAPHY. PATRICK B. DELANY, South Orange, N. J. Filed May 14, 1903. Serial No. 157,137.



Claim.—1. In a wireless-telegraph system, a microphonic contact, in the path of the received waves or impulses, electromagnetic means, for variably maintaining the microphonic contact at a high periodicity, comprising a local circuit controlled at said contact, and a receiver whose circuit is controlled at such contact, modification of the contact by the received waves or impulses effecting manifestation of the signals by the receiver.

2. In a wireless-telegraph system, a receiver comprising the combination of a relay whose winding is in closed circuit with a battery, a shunt-circuit around the relay-winding, completed at the contact of the relay, a second shunt-circuit around the relay-winding divided at the same contact, one division including the local battery and a resistance, and the other division a receiving instrument.

3. In a wireless-telegraph system, a receiver comprising the combination of a relay whose winding is in closed circuit with a battery, a shunt-circuit around the relay-winding, including the battery and a receiver which is cut in and out of said shunt-circuit at the contact of the relay to which the armature-lever is attracted.

4. In wireless telegraphy, a receiving apparatus comprising a normally maintained contact constantly varied locally by shunting at a high rate or periodicity, the modification of such contact by received signal waves or impulses causing a manifestation of the received signals.

5. A system of wireless transmission of signals, comprising a receiver apparatus having a normally maintained path for the received waves or oscillations, means, comprising an electric circuit completed through such path, acting to vary the latter at a high rate of periodicity, the modification of such path by such waves or oscillations causing manifestation of the signals.

6. In wireless telegraphy, a receiving apparatus comprising a normally maintained variable contact, variations of which are automatically self-effected at a high rate of periodicity and controlled at said contact, through which latter the circuit of a receiver is affected by the action upon said contact of received signal impulses.

7. In wireless telegraphy, a receiving apparatus comprising a normally maintained contact, means controlled at such contact for automatically rapidly varying it, and a receiving instrument in a circuit controlled by said contact which is affected by received signal impulses to make the latter manifest by the receiver.

8. In wireless telegraphy, a receiving apparatus comprising a normally maintained contact, means controlled at such contact for automatically electromagnetically varying it at a high rate of speed, and a receiving instrument in a circuit controlled at said contact, the contact being affected by received signal impulses to thereby make the signals manifest in the receiving instrument.

9. In wireless telegraphy, a receiving apparatus comprising a receiving instrument the circuit of which is divided, one branch thereof containing a source of current, and the other not, and a contact automatically normally maintained and constantly varied by shunting at which the branches of the receiver-circuit are controlled and which are so affected by received signal impulses as to make the latter manifest by the receiving instrument.

10. In wireless telegraphy, a receiving apparatus comprising an electromagnetic instrument having a movable part automatically maintained in vibration by variation of its circuit at its contact-points, a circuit containing a receiver and controlled at said contact-points which are affected by received signal impulses so that the latter are made manifest by the receiver.

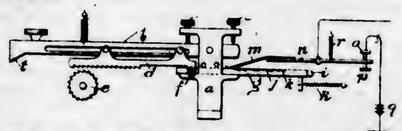
11. In wireless telegraphy, a receiving apparatus comprising a part automatically normally vibrated, normally maintaining a variable electrical contact and normally producing a continuous sound or note, said variable contact controlling the vibration of the normally self-vibrated part and being in the path of received signal impulses which so affect the contact as to make the signals manifest by changes in the sound or note.

12. In wireless telegraphy, a receiving apparatus comprising a normally maintained microphonic contact in the path of received oscillations, an electromagnetic automatic vibrator acting to vary, and controlled by said microphonic contact, and an electrical circuit containing a receiver controlled at said contact.

13. In wireless telegraphy, a receiving apparatus comprising a normally maintained microphonic contact in the path of received oscillations through which contact an undulatory local current is normally passed, means for automatically varying said contact and a receiver whose operation is controlled at the contact.

14. In wireless telegraphy, a normally maintained contact comprising a vibrating member, means controlled by such member and acting to vary the contact at a high rate of periodicity, and a receiving instrument in a circuit controlled by said contact.

808,642. **TELEGRAPHIC KEYBOARD APPARATUS.** PATRICK B. DELANY, South Orange, N. J. Filed Apr. 11, 1904. Serial No. 202,899.



Claim.—1. In an electric keyboard-transmitter, the combination of two parts one of which is movable relatively to the other from and to normal position in the same path, one of such parts having projecting surfaces corresponding with the component parts of a code-signal and the other part having a portion bearing on said projections, and one of such parts being vibrated by contacting with said portion and said projecting surfaces as one of the parts is moved from normal position, to thereby form electrical contacts corresponding with said projecting surfaces, the speed of return of said movable part to normal position and the inertia of the vibratile part being so related that on such return the vibratile part is not actuated to form said electrical contacts in reverse order.

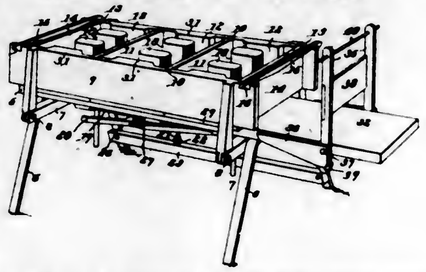
2. In an electric keyboard-transmitter, the combination of two parts, means whereby one of them is automatically moved from its normal position on the depression of the corresponding finger-piece in the keyboard and is automatically returned by the same path to normal position when the finger-piece is released, the other of said parts being a vibratory contact-maker part, one of said parts having surfaces upon it corresponding with the component parts of a code-signal and the other part having a portion in contact with said surfaces during the movement of one of the parts from and to normal position; the organization being such that in the movement of the movable part from normal position, the vibratile part is actuated to make electric contacts corresponding with said surfaces, and that on the return of the movable part to normal position, the speed of movement and inertia of the vibratile part are of such character that the latter will not be vibrated to form the electrical contacts in reverse order.

3. In a telegraphic keyboard-transmitter, the combination of two parts one of which is vibratile to form electrical contacts and the other of which has projecting surfaces corresponding with the component parts of a code-signal and one of such parts having a portion bearing on said surfaces, means for moving one of said parts relatively to the other at such speed that the projecting surfaces on one part produce corresponding vibrations of the other part, and means for returning such movable part to normal position at such rate of speed that the vibratile part is not actuated to produce in reverse order electrical contacts corresponding with said projecting surfaces.

4. In an electric keyboard-transmitter, the combination with a key, of a sliding bar having fashioned upon it designs corresponding with the component parts of a telegraphic signal, a rotating driver for engagement with said bar, a vibratile contact-maker controlled by said character-designs, a contact against which said contact-maker strikes, and means for returning the bar in contact with the contact-maker at such speed as not to vibrate the latter to form the signals in reverse order.

5. In an electric keyboard-transmitter the combination with a reciprocal signal-former, a contact-maker controlled by said former, a contact for said contact-maker, means for making telegraph characters by vibration of said contact-maker when said contact-former moves in one direction, and means for returning the former in contact with the contact-maker at such speed as not to vibrate the latter to form the signals in reverse order.

808,643. **CEMENT-BLOCK MACHINE.** MATTHEW BOKLEY, Archbold, Ohio. Filed June 21, 1905. Serial No. 266,363.



Claim.—1. In a machine for making hollow concrete blocks, the combination with a mold, of a bed-plate having one end thereof extended beyond the mold, and a block-supporting frame mounted for tilting movement on said extension.

2. In a machine for making hollow concrete blocks, the combination with a mold, of a bed-plate having one end thereof extended beyond the mold, and a block-supporting frame pivoted to said extension and mounted for tilting movement thereon.

3. In a machine for making hollow concrete blocks, the combination with a mold, of a bed-plate having one end thereof extended beyond the mold, and a tilting block-supporting frame pivotally mounted on said extension and provided with angularly-disposed arms for changing the position of the blocks.

4. In a machine for making hollow concrete blocks, the combination with a mold, of a bed-plate having one end thereof extended beyond the mold, and a tilting block-supporting frame pivotally mounted on said extension for changing the position of the blocks, the horizontal arms of said frame being normally disposed in the same longitudinal plane with the bed-piece.

5. In a machine for making hollow concrete blocks, the combination with a mold, of a bed-plate having one end thereof extended beyond the mold, a tilting block-supporting frame pivotally mounted on said extension and provided with angularly-disposed arms for changing the position of the blocks, and laterally-extending spring-clips secured to one of said arms and engaging the pivoted end of the adjacent arm.

6. In a machine for making hollow concrete blocks, the combination with a mold, of a bed-plate having one end thereof extended beyond the mold, a block-supporting frame mounted for tilting movement in the extension and comprising angularly-disposed arms pivoted to said extension on each side thereof, and a rod connecting said arms and constituting a handle for operating the frame.

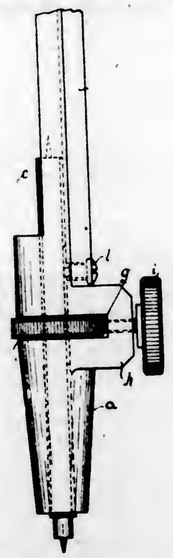
7. In a machine for making hollow concrete blocks, a mold comprising a bed-plate having side walls pivoted thereto, detachable end walls engaging the side walls, locking-bars for securing said walls in closed position, vertically-reciprocating cores movable to operative position within the mold, an operating member pivotally connected with the cores, and means for locking the operating member in elevated position.

8. In a machine for making hollow concrete blocks, a mold comprising a bed-plate, side walls pivoted thereto and provided with spaced vertical grooves, detachable end walls engaging the side walls, removable partitions seated in the grooves of said side walls and dividing the mold into a plurality of molding compartments or chambers, vertically-reciprocating cores movable to operative position within the molding compartment, an operating member pivotally connected with the cores, a loop secured to the bed-plate, and a locking-bolt carried by the operating member for securing the latter in elevated position.

9. In a machine for making hollow blocks, a mold comprising a bed-plate, side walls pivoted thereto, detachable end walls engaging the side walls, partitions dividing the mold into a plurality of molding compartments or chambers, a removable pallet seated on the bed-plate in each compartment, vertically-reciprocating cores movable to operative position within the mold, an operating member pivotally connected with the cores, and means for locking said operating member in elevated position.

10. In a machine for making hollow blocks, a supporting-frame, a bed-plate secured thereto, side walls pivoted to the bed-plate, detachable end walls engaging the side walls, vertically-reciprocating cores movable to operative position within the mold, an operating member pivotally connected with the cores, a bar extending longitudinally of the supporting-frame, a link pivoted to said bar and to one end of the operating member, a pivoted connection between the intermediate portion of said operating member and the cores, a loop secured to the bed-plate, and a bolt slidably mounted on one end of the operating member and adapted to engage said loop for locking the operating member in elevated position.

808,644. **ADJUSTING MECHANISM FOR SCREW-THREADED NEEDLE-POINT INSERTIONS OF COMPASSES.** JOHANN EICHMÜLLER, Nuremberg, Germany, assignor to The Firm of Eugene Dietzgen Co., New York, N. Y. Filed Apr. 11, 1905. Serial No. 255,027.



Claim.—1. In combination in a compass having a needle-foot having a longitudinal bore therein, a screw-threaded needle adapted to fit in said bore, said foot having a lateral recess therein, a disk fitting in said recess and having a screw-threaded central opening through which the needle passes, and means for preventing the needle from rotating when the disk is turned, substantially as described.

2. In combination in a compass having a needle-foot provided with a smooth longitudinal bore, a screw-threaded needle fitting in said bore, said needle having a longitudinal recess therein, a screw in said foot having its end engaging in said recess so as to prevent the needle from turning, said foot having a lateral recess and a disk fitting in said recess and having a central screw-threaded hole through which the needle passes.

3. In combination in a compass having a needle-foot provided with a smooth longitudinal bore, a screw-threaded needle fitting in said bore, means for preventing the needle from rotating, said foot having a lateral recess, a disk fitting in said recess and having a central screw-threaded hole through which said needle passes, a stirrup-shaped enlargement connected to the needle-foot and inclosing on one side the said recess and a pressure-screw mounted in said enlargement and having its end adapted to engage with the disk so as to prevent movement of the same.

808,645. **HAIR-DRIER.** FANNIE S. HUNTER, Richmond, Ind. Filed Apr. 12, 1905. Serial No. 255,212.

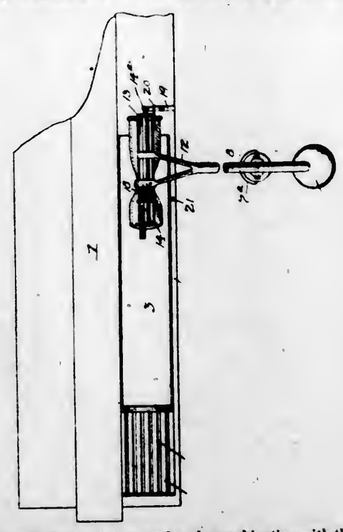
Claim.—1. A hair-drier of the character described having in combination a body portion, a U-shaped spring member attached to the same forming fingers and a handle portion, a rubber-covered roller mounted on each finger, antifriction-bearings therefor, a lever pivoted to the body portion and bearing on one of the fingers to separate the fingers, and a hand-plate attached to one member of the handle, substantially as described.

2. A hair-drier of the character described having in combination a body portion, a spring member extending through the body portion forming fingers and a handle portion, a rubber-covered roller mounted revolubly on each finger, antifriction-bearings therefor, means for admitting lubricants to the interior parts, a lever pivoted to the body portion and bearing on one of the fingers to separate the fingers when desired, and a hand-plate attached to one member of the handle, all substantially as described.

3. A hair-drier of the character described having a body portion, a spring member formed U-shaped and extending through said body portion, one arm thereof secured in the body portion and the other arm thereof having a limited movement in the body portion, said spring member forming two parallel fingers on one side of the body and a handle on the opposite side of the body, a hand-plate secured to the handle, a rubber-covered roller revolubly mounted on each of said fingers, and a pair of antifriction-bearings for each of said rollers, all substantially as shown and described.

4. A hair-drier comprising a body portion, a U-shaped member forming a handle a movable finger and a stationary finger, a pair of sleeves—having facing bevel ends—secured on the extremities of each finger, a pair of thimbles for each finger having faces corresponding to the faces of the sleeves, a tube surrounding each finger and connecting the respective pairs of thimbles, a plurality of balls located between the bevel-faces of the sleeves and the thimbles, a rubber sleeve—having an outer acuminated end—for each finger covering the said tubes and inclosing its respective finger portion, all substantially as and for the purposes set forth.

808,646. **MAIL-BAG CATCHER.** LEWIS J. EVANS, Riverside, N. Y., assignor of one-fourth to Coe Tyler and three-eighths to John M. Davidge, Binghamton, N. Y. Filed Apr. 12, 1905. Serial No. 255,136.



Claim.—1. In a mail-bag catcher the combination with the car having a chute on the roof thereof provided with an open side and having a part extending within the car, of a bag having a permanently-attached suspending-loop near each end, a rock-shaft having projections designed to engage said loops, and tripping means

whereby said shaft is rotated by the car to release the bag, substantially as described.

2. In combination a car, a bag-receiving chute carried thereby, a bag having suspending-loops at or near each end, a supporting device having retaining devices for engaging said loops, and means actuated by the passage of the car for releasing the loops from said retaining devices, substantially as described.

3. In combination a car, a bag-receiving chute carried thereby, a bag having suspending-loops near each end, a pivotally-supported sweep, a pair of retaining devices carried at the end of said sweep for supporting the bag, and means tripped by the passage of the car for actuating said retaining devices, substanitally as described.

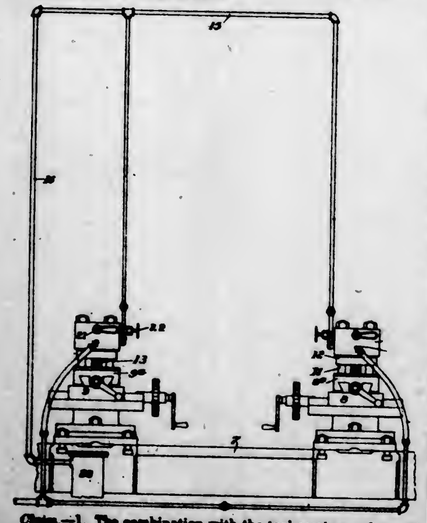
4. The combination with a car having a bag-receiving device, of a bag-supporting device comprising a pivoted sweep, a frame carried on the outer end thereof, a rock-shaft journaled in said frame, bag-retaining devices carried by said rock-shaft, means for holding said rock-shaft with said retaining devices in bag-holding position, and tripping means actuated by the passage of the car for tripping said rock-shaft, substantially as described.

5. The combination with a car having a bag-receiving device, of a post at the side of the track, a sweep pivoted on said post to swing vertically and horizontally, a fork carried by the post for holding the sweep elevated, bag-retaining means carried by said sweep, and means for automatically releasing the bag and disengaging the sweep from the fork, substantially as described.

6. The combination with a car having a bag-receiving device, of a bag-holding device comprising a suitable frame, a rock-shaft journaled therein, bag-retaining pins carried by said rock-shaft, a spring exerting tension on said shaft, a bag-depressing lever pivoted in the frame and adapted to be held elevated by one of said pins, a spring for exerting tension on said depressing-lever, a locking-lever for holding said rock-shaft against rotation, and means tripping said locking-lever, substantially as described.

7. In a bag-holding device, a frame, a rock-shaft journaled therein, projections on said rock-shaft adapted to engage loops at the ends of a bag, tripping means for holding said shaft with said projections extending horizontally, and pivoted retaining devices in proximity to said projections for holding the loops thereon, substantially as described.

808,647. **HYDRAULIC TOOL-CLAMP.** ROLLIN D. FILBEN, Chicago, Ill., assignor of one-half to Le Grand Parish, Chicago, Ill. Filed Dec. 7, 1904. Serial No. 235,269.



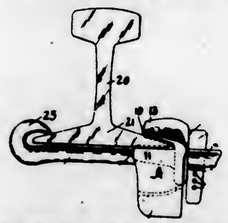
Claim.—1. The combination with the tool carriage, of a vertically reciprocating jaw for clamping the tool thereon, and hydraulic means for moving said jaw, and the connecting pipe to supply high pressure fluid thereto, comprising a rigidly jointed pipe having a very long stem, whereby the tool carriage may move by the flexibility of said pipe without requiring the use of movable joints, substantially as described.

2. The combination with a pair of movable tool carriages and the hydraulically operated clamping jaws 12, of a pair of long vertical steel pipes attached by regular screw joints to the hydraulic clamp and to the feed pipe 15 from overhead, substantially as described.

3. The combination of a tool carriage movable in two directions a cylinder fixed thereon, a plunger in the cylinder adapted to clamp a tool on the carriage, and a hydraulic metal feed pipe for the cylinder screwed fixedly thereto and extending for a relatively great distance approximately perpendicular to the plane of movement of the carriage, substantially as, and for the purpose, described.

4. A hydraulic clamping device comprising in combination a movable carriage, a hydraulic cylinder thereon, a plunger in said cylinder adapted to actuate a clamping mechanism, and a hydraulic metal feed-pipe for said cylinder extending for a relatively great distance approximately perpendicular to the plane of movement of the carriage, substantially as described.

808,648. **ANTICREEPING DEVICE FOR RAILS.** JESSE J. O. FRUEHM, Racine, Wis., assignor to himself and Martin J. Goepfert, Racine, Wis. Filed June 24, 1905. Serial No. 266,717.



Claim.—1. In an anticreeping device for rails, the combination of a jaw having upper and lower members adapted to grip over the edge of a rail-flange, a piece set in said jaw transversely to said flange adapted to bite thereinto, and means for holding said jaw against longitudinal motion.

2. An anticreeping device for railway-rails comprising a jaw having upper and lower members adapted to grip over the edge of a rail-flange, one or more separate pieces having sharpened, hardened edges set in one or both of said members in such manner that said edges project from the inner face or faces thereof transversely to the rail, and means for drawing said jaw transversely over the edge of the rail-flange whereby said edges are caused to bite thereinto.

3. An anticreeping device for rails comprising a hooked bar, a jaw sliding on said bar and adapted to grip over the edge of a rail-flange, said bar having a slot therein, and a tapered cotter passing through said slot.

4. An anticreeping device for rails comprising a hooked bar, a jaw sliding on said bar and adapted to grip over the edge of a rail-flange, said bar having a slot therein, a tapered cotter passing through said slot, and one or more adjustment-pieces 33, 34 inserted between said cotter and said jaw.

5. In an anticreeping device for rails, a jaw having upper and lower members adapted to grip over the edge of a rail-flange, hardened edges set transversely to the flange and adapted to bite thereinto, and means for holding said jaw against longitudinal motion.

6. In an anticreeping device for rails, a jaw having upper and lower members adapted to grip over the edge of a rail-flange, a piece set in said jaw transversely to the flange and having an edge adapted to bite thereinto, and an abutment-flange adapted to transfer the longitudinal thrust of the rail to the side of a tie.

7. In an anticreeping device for rails, a clamping-jaw having upper and lower members adapted to grip over the edge of a rail-flange and having an abutment-face at the side thereof, and hardened knife-blocks set transversely in the faces of said jaw so that their edges project therefrom and bite into the metal of the rail-flange.

8. An anticreeping device for rails comprising a clamping-jaw having upper and lower members adapted to grip over the edge of a rail-flange and having an abutment-face at the side thereof, and hardened knife-blocks set transversely in the faces of said jaw so that their edges project therefrom and bite into the metal of the rail-flange, in combination with a member passing under the rail and one end passing through a hole in said jaw, the other end being provided with means for gripping the opposite edge of the flange; and means for forcing said jaw along the shank of said member.

9. An anticreeping device for rails comprising a clamping-jaw having upper and lower members adapted to grip over the edge of a rail-flange and having an abutment-face at the side thereof, and hardened knife-blocks set transversely in the faces of said jaw so that their edges project therefrom and bite into the metal of the rail-flange, in combination with a member passing under the rail and one end passing through a hole in said jaw, the other end being provided with means for gripping the opposite edge of the flange; a tapered cotter passing through a slot in the first-named end of said member, and means for preventing said cotter from being loosened in said slot when driven thereinto.

10. An anticreeping device for rails comprising a clamping-jaw having two members each provided with means for biting into one side of the rail-flange, a third member midway between the other two and having means for biting into the other side of the rail-flange, and means for preventing a longitudinal motion of said clamping-jaw.

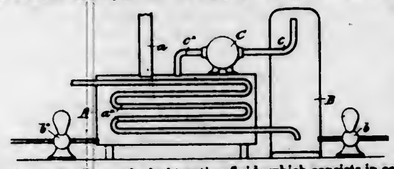
11. An anticreeping device for rails comprising a clamping-jaw having two projecting members abutting on the lower face of the rail and having means adapted to bite thereinto, a third member abutting on the upper face of the rail and midway between the other two, and means for preventing a longitudinal movement of said clamping-jaw.

12. An anticreeping device for rails comprising a clamping-jaw having a wedge-shaped recess adapted to receive the edge of the rail-flange, a pair of knife-edges set transversely in one face of said recess, and a third knife-edge set transversely in the other face of said recess, said blades being adapted to bite into the opposite faces of the rail-flange when said jaw is forced thereover; and means for holding said jaw in position on said flange.

13. In an anticreeping device for rails, a jaw having upper and lower members adapted to grip over the edge of a rail-flange, and one or more rectangular bars set in one of the jaws and having one edge projecting on the inner face thereof and transversely to the rail whereby to bite into the rail-flange when the jaw is drawn thereover.

14. In an anticreeping device for rails, a gripping-jaw comprising upper and lower members adapted to grip over the edge of a rail-flange, a pair of rectangular bars set in the lower jaw transversely to the rail, and a single rectangular bar similarly set in the upper jaw, said bars each having one edge projecting, and said single bar being midway between the other two.

808,649. **METHOD OF DISTILLING AND CONDENSING.** JOHN S. FORBES, Philadelphia, Pa. Filed Aug. 30, 1905. Serial No. 276,188.



Claim.—1. The method of treating fluids which consists in condensing a body of vapor from an external source of supply by means of a cooler-body of fluid, exhausting vapor from said fluid after it has been used for condensing, compressing said vapor and then condensing the same, substantially as described.

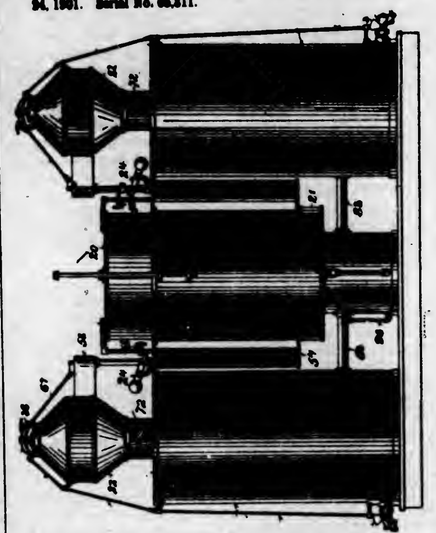
2. The method of treating fluid, the same consisting in raising the temperature of a body of liquid by causing it to condense a vapor, vaporizing and then compressing the vapor from a portion only of said heated fluid thereby raising the temperature of the vapor and condensing said vapor by bringing it into contact with surfaces at a relatively lower temperature, substantially as described.

3. The method of obtaining distilled water, the same consisting in continuously delivering steam to a container, condensing said steam by bringing it into contact with water-cooled surfaces within said container, exhausting vapor from the vessel receiving the said water, and compressing the vapor so obtained in the said first container thereby condensing said vapor, substantially as described.

4. The method of treating fluid, the same consisting in condensing within a container a body of vapor obtained from a source of supply external to the same, exhausting vapor from a vessel containing the liquid employed in condensing said first body of vapor, compressing the same, and condensing said compressed vapor within said first container, substantially as described.

5. The method of treating fluid, the same consisting in passing liquid through a series of pipes, heating said liquid, simultaneously condensing a body of vapor by bringing the same into contact with said pipes, exhausting vapor from the liquid after it has passed through said series of pipes, compressing said vapor and forcing it into contact with the outside surface of said pipes, substantially as described.

808,650. **GAS-GENERATOR.** NELSON GOODYEAR, Flushing, N. Y., assignor to J. B. Colt Company, a Corporation of New York. Filed June 24, 1901. Serial No. 65,811.



Claim.—1. In a carbid-feed generator, the combination with carbid-feeding mechanism for dropping the carbid into the water, of carbid-charging and flushing-out devices, and operative connections so constructed that each of said devices controls some of the operations of the other in such manner that in certain positions of one device when said device is locked, the other may be operated independently thereof, without unlocking said first-named device.

2. In a carbid-feed generator, the combination with carbid-feeding mechanism for dropping the carbid into the water, of carbid-charging and flushing-out devices, and operative connections so constructed that said devices, at least in part, reciprocally control each other in such manner that in certain positions of one device when said device is locked, the other may be operated independently thereof, without unlocking said first-named device.

3. In a carbid-feed generator, the combination with carbid-feeding mechanism for dropping the carbid into the water, of carbid-charging and flushing-out devices, and interlocking connections between the same, whereby movement of each controls some of the movements of the other in such manner that in certain positions of one device when said device is locked, the other may be operated independently thereof, without unlocking said first-named device, for substantially the purposes set forth.

4. In a carbid-feed generator, the combination of carbid-charging and flushing-out devices, and interlocking connections between the same for locking the carbid-charging device closed when the flush-out is closed and for locking the flush-out open when the carbid-charging device is opened, substantially for the purposes set forth.

5. In a carbid-feed generator, the combination of carbid-charging and flushing-out devices, and interlocking connections between the same, whereby the charging device cannot be opened except when the flush-out is open, and the flush-out cannot be closed except when the charging device is closed, substantially for the purposes set forth.

6. In a carbid-feed generator, the combination of carbid-charging and flushing-out devices, and interlocking connections between the same for preventing charging when the flush-out is closed, substantially for the purposes set forth.

7. In a generator, the combination of charging and flushing-out devices, and interlocking connections between the same for locking the flush-out open at all positions of the charging device between

its open and closed positions, substantially for the purposes set forth.

9. In a generator, the combination of a hopper, a feeding mechanism therefor, provided with a pivoted operating-lever extending substantially horizontally within the hopper, and a casing within the hopper and extending over said pivoted lever thereby preventing the contents of the hopper from interfering with said mechanism, substantially for the purposes set forth.

9. In a generator, the combination of a hopper, a feeding mechanism extending within the hopper and having a rocking lever, and means for preventing the contents of said hopper from interfering with the feeding mechanism, substantially for the purposes set forth.

10. In a feeding mechanism for a generator, the combination of a hopper, a movable valve or stop, a valve-rod connected thereto, a lever connected to the valve-rod, a gas-tight tubular extension external to the hopper and extending outwardly from the walls of the hopper continuous therewith and arranged outside of said hopper and water-sealed at its outward end, said tubular extension communicating freely with the hopper, an actuating-rod connected to the said lever and extending through said gas-tight extension, and gas-actuated means arranged externally to the hopper and gas-tight and water-sealed extension, and connected to operate the rod extending through the water-sealed tube, for operating the said actuating connections to control the valve or stop.

11. The combination with the feeding mechanism of a generator, of a passage-way through which the material is fed, an auxiliary valve or stop therefor normally inactive, and means for holding said stop and releasing it when the gas pressure or volume exceeds a predetermined amount, substantially for the purposes set forth.

12. The combination with the feeding mechanism of a generator, of a passage-way through which the material is fed, an auxiliary valve or stop therefor normally inactive, and means for holding the said stop and releasing it when the water-level falls in the generator, said means comprising a float and connections between said float and said auxiliary valve or stop, substantially for the purposes set forth.

13. The combination with the hopper, the feeding mechanism, and the passage-way through which the material is fed, of means additional to the feeding mechanism for stopping the feeding of material when the water-level falls, substantially for the purposes set forth.

14. In a generator, the combination with the feeding mechanism, of an auxiliary valve adapted to be released when the gas pressure or volume exceeds a predetermined amount, substantially for the purposes set forth.

15. In a generator, the combination with the feeding mechanism, of feed-actuating mechanism having coöperating members forming a part thereof, a charging device movable independently of said members, and means for locking the coöperating members of the feed-actuating mechanism out of operative relation except when the charging device is shut, and for locking the charging device except when the said members of the feed-actuating mechanism are out of operative relation, for substantially the purposes set forth.

16. In an acetylene-generator, the combination with the feeding mechanism, of a charging device, feed-actuating mechanism movable independently of the charging device, means controlled by the charging device for preventing the engagement of the operative connections of the feed-actuating mechanism when the parts of the apparatus are in a position to permit the charging device to be opened, and means for preventing the opening of the charging device without moving the connections of the feed-actuating mechanism out of operative engagement.

17. In a generator, the combination with the feeding mechanism, of feed-actuating mechanism having coöperating connections forming a part thereof, a charging device movable independently of said connections, and means for preventing the opening of the charging device until the said coöperating connections of the feed-actuating mechanism are out of operative relation, for substantially the purposes set forth.

18. In a generator, the combination with the feeding mechanism, of feed-actuating mechanism having coöperating connections forming a part thereof, a charging device movable independently of said connections, and means for preventing the movement of the coöperating connections into operative relation as long as the charging device is in a position to permit charging, for substantially the purposes set forth.

19. In a generator, the combination with the feeding mechanism, of feed-actuating mechanism having coöperating connections forming a part thereof, a charging device movable independently of said connections, provision for permitting the opening and closing of the charging device as long as the coöperating connections of the feed-actuating mechanism are out of operative relation, and provision for preventing the charging of carbid except when said connections are out of operative relation, for substantially the purposes set forth.

20. In a generator, the combination with the feeding mechanism, of feed-actuating mechanism having coöperating members forming a part thereof, a charging device having a member coöperating with said first-named members, with provision for locking the first-named coöperating members of the feed-actuating mechanism out of operative relation except when the charging device is shut, and for locking the charging device except when the said members of the feed-actuating mechanism are out of operative relation, for substantially the purposes set forth.

21. In an acetylene-generator, the combination with the feeding mechanism, of a charging device, means for causing the lowering of the water-level when the charging device is opened, and means controlled by the water-level for preventing the feeding of carbid, whereby when the charging device is opened, feeding of carbid is prevented.

22. In an acetylene-generator, the combination with the feeding mechanism, of a charging device, means for varying the water-level when the charging device is opened, and means operated by the water-level for controlling the feeding of carbid, whereby when the charging device is opened, the feeding of carbid is prevented.

23. In a carbid-feeding mechanism for an acetylene-generator, the combination with a hopper, of a feed-valve and a protective casing over said valve movable therewith, the said casing being adapted to agitate the carbid around the valve on rising and thereby start the flow of carbid from the hopper.

24. In a carbid-feeding mechanism for an acetylene-generator, the combination with a hopper, of a feed-valve and a protective casing over said valve movable therewith, the said casing being provided with a flaring lower edge for agitating the carbid around the valve on rising and thereby starting the flow of carbid from the hopper.

25. In an acetylene-gas generator, the combination of a carbid-hopper and removable cover, a generating-chamber, means for feeding the carbid to the generating-chamber, operative means between the carbid-feeding means and the gasometer for automatically controlling the feeding of carbid, means for disconnecting said automatic controlling means from the feeding means, and means between the cover of the hopper and said automatic controlling means for maintaining said disconnection as long as the cover is open.

26. A gas-generator comprising a generating-chamber, a movable gas-holder, means for introducing water into the generating-chamber, a valve for controlling the admission of carbid to the said generating-chamber, and a safety means for closing said valve, the said means being operable by the water in the generating-chamber.

808,651. **CAR-COUPLING DEVICE.** EDWARD GRAFSTROM, Topeka, Kans.; Dorothy Beach Grafstrom administratrix of said Edward Grafstrom, deceased. Filed May 27, 1905. Serial No. 261,823.

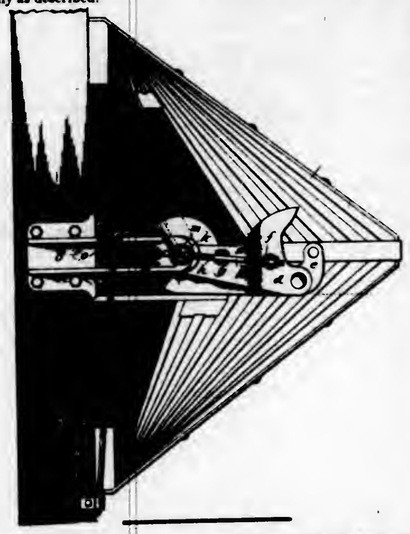
Claim.—1. The combination with a coupler bar having a hinged extension carrying a locking coupler, of a lever mounted upon said extension for operating the coupler lock, and a second lever attached to the body of the car or engine for operating said first mentioned manipulating lever from outside the car line.

2. The combination with a pivoted coupler bar, of a pair of levers one of which is borne on the pivoted bar and one of which is borne on the car and designed to coöperate with the pivoted coupler bar when it is in alinement and to be out of operative position when the same is folded against the car body, substantially as described.

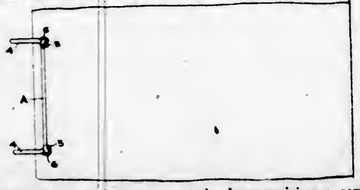
3. In a car coupler the combination with a coupler head and an extension carrying the same mounted pivotally to swing sidewise out of operative position, a coupler lock operating mechanism carried on said swinging head, and means for operating said locking mechanism from outside the car comprising levers which are in an engagement when the extension is in operative alinement with the car and is out of engagement when the said coupler head is swung sidewise out of position.

4. The combination with a coupler head extension pivoted to swing sidewise out of operative position, an automatic coupler and a coupler lock thereon, a lever mounted on the swinging extension, a lever mounted on the car and provided with a fork engaging the first mentioned lever to operate the coupler lock, said connection of the two levers being adapted to engage when the coupler bar is in alinement and to disengage when it is swung sidewise out of position.

5. The combination with a pivoted extension coupler bar having a coupler lock operating mechanism thereon, of an actuating lever on the extension and an operating lever on the car provided with a forked end loosely engaging said lever on the extension, substantially as described.

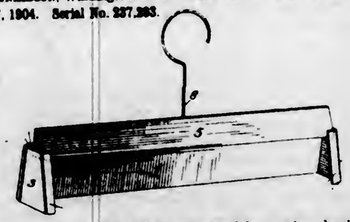


808,652. **NOTE-BOOK.** JOHN C. HACKMANN and WILLIAM H. PALMER, St. Paul, Minn. Filed Jan. 15, 1902. Serial No. 89,795.



Claim.—In combination a note-book comprising a series of loose leaves and a binder consisting of a single piece of wire bent to form a straight portion and at each end to form a complete circle standing at a right angle with said straight portion whereby the leaves will swing freely upon said circular portions from end to end thereof so as to always lie flat.

808,653. **GARMENT-HANGER.** WILLIAM F. HALL and WALTER DONALDSON, Washington, D. C. Filed Oct. 11, 1900. Renewed Dec. 17, 1904. Serial No. 237,283.



Claim.—1. A garment-hanger comprising a piece having slits in its ends, extending from edge to edge of the piece and of the same size throughout, wedge-shaped guides having plain flat base-flanges fitted to said slits and held therein with the end wall of the guides extending from the slit up across the end of the slitted piece, and a piece arranged to slide in the guides to hold the garment.

2. In combination in a garment-hanger, a piece having slits at its ends, guide-pieces having a base-flange fitted to the slit, the metal of said base-flange being upset into the material of the slitted piece adjacent to the slit and a clamping-piece movable in the guide-pieces, substantially as described.

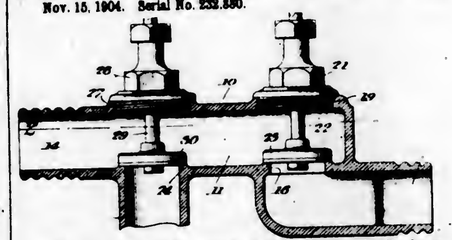
3. In combination in a garment-hanger, a piece having slits at its ends, guide-pieces having a flange fitted to the slit with the edge of the flange bearing against the bottom of the slit, said flange being upset into the wood forming the wall of the slit intermediate of its side edges, substantially as described.

4. In combination in a garment-hanger, a back-piece having slitted ends, guides having base-flanges inserted in the slits, the metal of the base-flange being punched through the wooden back-piece from one side of the slit into the wood on the opposite side of the slit and a clamping member movable in the guides on the back-piece to clamp the garment between itself and the said back-piece, substantially as described.

5. In combination in a garment-hanger, a back-piece guides presenting wedge-shaped guideways and having a portion driven into the back-piece at or near its ends and a wedge member movable in the guides to hold the garment.

6. In combination in a garment-hanger, a back-piece, guides presenting wedge-shaped guideways and having a portion inserted in the back-piece intermediate the thickness thereof and a wedging member movable in the said guides, substantially as described.

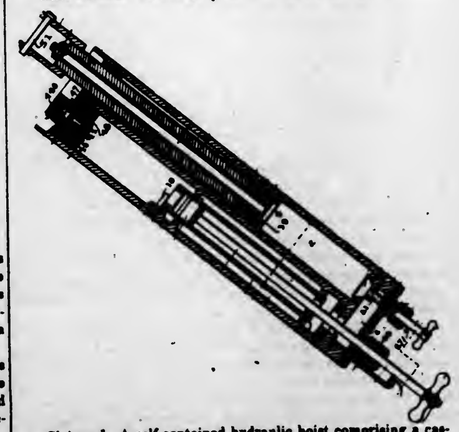
808,654. **VALVE.** ELLIS E. HARTGRAVE, Wyndmere, N. D. Filed Nov. 15, 1904. Serial No. 232,880.



Claim.—1. In a valve, a casing divided into longitudinal compartments, connected into a single outlet at one end and with each compartment provided with an independent inlet at the other end, and with a branch outlet connected to said compartments intermediately of the ends, and valves independently operating between said compartments and said single outlet, and valves operating between said compartments and said branch outlets.

2. In a valve, a casing divided into longitudinal compartments, connected into a single outlet at one end and with each compartment provided with an independent inlet at the other end, valve-seats between said compartments and said single outlet, threaded apertures in said casing in alinement with said valve-seats, valve-stem packing members engaging said threaded apertures and valves operating upon said valve-seats and having stems passing through said packing members.

808,655. **HYDRAULIC HOIST.** URBAN HARVEY, U. S. Revenue-Cutter Service. Filed Aug. 22, 1904. Serial No. 221,737.



Claim.—1. A self-contained hydraulic hoist comprising a casing having therein a pair of parallel communicating cylindrical

bores, a hoisting-piston in one of said bores, a pump in the other of said bores, the cylinder of said pump being of considerably less volume than the said bore to provide an adequate reservoir therein for motive fluid, a check-valve between said bores, means for unseating the same, and trunnions on said casing.

2. In a hydraulic hoist, the combination of a cylinder, a motor-piston therein, a receptacle for motive fluid, a passage-way between said receptacle and said cylinder, a reciprocating cylinder within and of considerably less length than said receptacle, said cylinder adapted by its movement to close and establish communication between the receptacle and the passage-way, a pump-piston in said cylinder, and a stop intermediate the ends of the receptacle for limiting the movement of the cylinder.

3. In a self-contained hydraulic hoist, the combination of a cylinder, a motor-piston therein, a fluid-receptacle adjacent said cylinder, a passage-way connecting said receptacle and said cylinder, a cylinder of considerably less length than said receptacle and of sufficiently smaller diameter than the inner diameter of said receptacle to provide an adequate reservoir for motive fluid, said cylinder reciprocating within said receptacle, and adapted to close communication between said passage-way and said receptacle when at the end of a stroke, a piston within said last-mentioned cylinder and frictionally engaging the inner wall thereof, an operating-rod for said piston extending through said casing, means carried by said casing for engaging said rod to support the cylinder in a position to establish communication between the passage-way and the receptacle, a check-valve arranged to prevent the flow of fluid from the first-mentioned cylinder into the receptacle, and means for unseating said valve.

4. In a hydraulic hoist, the combination of a cylinder, a motor-piston in said cylinder, a receptacle for motive fluid, a passage-way between said receptacle and said cylinder, a reciprocating cylinder within the receptacle adapted by its movement to establish and cut off communication between the receptacle and the first-mentioned cylinder, a piston in said reciprocating cylinder, and a bushing adjacent each end of said cylinder.

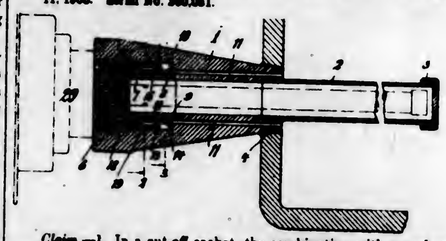
5. In a hydraulic hoist, the combination of a cylinder, a motor-piston therein, a receptacle for motive fluid, a passage-way between said receptacle and said cylinder, a reciprocating cylinder in said receptacle, a piston in said cylinder, lugs projecting inwardly from said receptacle to form a guide for the cylinder, an inwardly-projecting boss above said lugs, the projection of the boss being no greater than that of the lugs, and a stop-pin fitted within said boss.

6. A self-contained hydraulic hoist consisting of a casing having therein a cylinder, a piston in said cylinder, a receptacle for motive fluid adjacent said cylinder, one end of said casing being hollow to form a part of the passage-way between said receptacle and said cylinder, a plate secured to said end of the casing and completing the passage-way, a reciprocating cylinder in said receptacle, said cylinder adapted to close and establish communication between the receptacle and the passage-way, a piston in said last-mentioned cylinder, said piston having a rod extending through the plate on the end of the casing, a bracket supported by said plate, a pin on the piston-rod adapted to engage said bracket to hold the cylinder in position to establish communication between the passage-way and receptacle, a check-valve between the passage-way and the first-mentioned cylinder, and an operating-pin for unseating said valve, said pin being fitted in the plate at the end of the casing.

7. In a self-contained hydraulic hoist, the combination of a cylinder, a motor-piston therein, a receptacle for motive fluid, a passage-way between said receptacle and said cylinder, a check-valve between said passage-way and said cylinder, said valve having a slotted stem, a pin projecting into the slot in said stem, an operating-pin for unseating said check-valve, a reciprocating cylinder in the receptacle, said cylinder adapted to establish and to close communication between the receptacle and the passage-way, a piston in said cylinder, a piston-rod connected with said piston and extending adjacent to the operating-pin for the check-valve, and means for supporting said last-mentioned piston and the cylinder in a position to establish communication between the passage-way and the receptacle.

8. In a self-contained hydraulic hoist, the combination of a cylinder, a piston therein having its rod extending through the upper end of the casing, a receptacle for motive fluid adjacent said cylinder and communicating with the bottom thereof, a pump in said receptacle, a plug for the upper end of said receptacle, said plug having a valved passage-way therethrough, and a concave receptacle surrounding said rod and the upper end of said plug and communicating with the passage-way therethrough.

808,656. CUT-OFF SOCKET. DANIEL H. HAYWOOD, New York, N. Y., assignor to William B. Wadsworth, Plainfield, N. J. Filed May 11, 1905. Serial No. 260,081.



Claim.—1. In a cut-off socket, the combination with a socket member arranged to removably support a regulator, of means for controlling admission of fluid to the socket, operated by the insertion and removal of the regulator.

2. A cut-off socket comprising a socket member having means for securing same to a tank, and means for removably receiving a regulator therein, and means operated by the insertion and removal of the regulator for controlling admission of fluid to the socket from the tank.

3. A cut-off socket having a portion adapted to enter a tank, and provided with means for securing it to the tank, said socket adapted and arranged to removably support a thermostatic device, and provided with means operated by the insertion and removal of the thermostatic device for controlling admission to the socket of fluid from the tank.

4. A cut-off socket comprising a shell adapted to be secured to the wall of a tank, and a tube adapted to extend inward within the tank, said socket adapted and arranged to removably support a regulator, and provided with means operated by the insertion and removal of the regulator for controlling admission to the socket of fluid from the tank.

5. A cut-off socket comprising a shell adapted to be secured to the wall of a tank, and a tube adapted to extend therefrom inward within the tank when in position therein, said shell having an internally-screw-threaded portion adapted for engagement with the correspondingly-screw-threaded portion of the temperature-regulator; and means operated by the insertion and removal of the temperature-regulator for controlling admission to the socket of fluid from the tank.

6. The combination with a tank and a thermostatic device extending therein, of a cut-off socket surrounding the portion of the thermostatic device in the tank, and means operated by the insertion and removal of the thermostatic device for controlling admission of fluid to the socket from the tank.

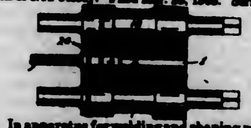
7. The combination with a tank of a socket extending within same, a thermostatic device removably fitted to said socket, and means operated by the insertion and removal of the thermostatic device for controlling admission to the socket of fluid from the tank.

8. In a cut-off socket, the combination with a shell arranged to receive a thermostatic device, and a valve arranged to control admission of fluid to the interior of the shell, said valve having a portion arranged in the path of the thermostatic device, when same is being inserted.

9. In a cut-off socket, the combination with a shell arranged to receive a thermostatic device, of a valve-casing fitted thereto, a valve in said casing arranged to control admission of fluid to within the socket, and an operating member for said valve arranged to be engaged by said thermostatic device while it is being inserted.

10. In a cut-off socket, the combination with a socket member or shell arranged to removably support a regulator, said shell provided with a plurality of circulating-passages, of valve mechanism controlling said passages, and operated by the insertion and removal of the said regulator.

808,657. SOCKET-WELDING APPARATUS. DAVID HOUSTON, McKeesport, Pa., assignor to National Tube Company, Pittsburg, Pa., a Corporation of New Jersey. Filed Nov. 22, 1902. Serial No. 149,102.



Claim.—1. In apparatus for welding and shaping pipe-couplings or similar articles, the combination of a central mandrel and a cluster

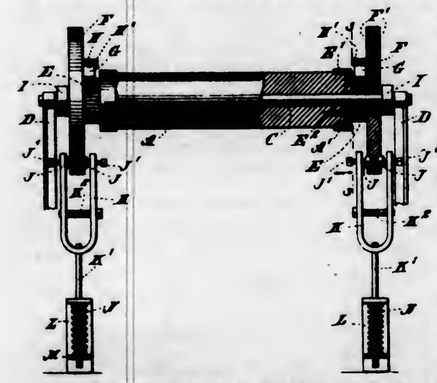
of rolls surrounding the same, said rolls having flanges at each end adapted to contact with the mandrel and confine the blank, said mandrel corresponding in diameter to the interior of the article to be formed and having a portion of enlarged diameter at one end projecting into the pass of the rolls, and coöperating annular shoulders on the mandrel and rolls to prevent endwise movement of the mandrel during the welding and shaping operation.

2. In apparatus for welding and shaping pipe-couplings or similar articles, the combination of a central mandrel and a cluster of rolls surrounding the same, said rolls having flanges at each end adapted to contact with the mandrel and confine the blank, said mandrel corresponding in diameter to the interior of the article to be formed and having a portion of enlarged diameter at one end projecting into the pass of the rolls, and coöperating annular grooves and ribs on the mandrel and rolls for preventing endwise movement of the mandrel during the welding and shaping operation.

3. In apparatus for welding and shaping pipe-couplings or similar articles, the combination of a central mandrel and a cluster of rolls surrounding the same, said rolls having flanges at each end adapted to contact with the mandrel and confine the blank, said mandrel corresponding in diameter to the interior of the article to be formed and having a portion of enlarged diameter at one end projecting into the pass of the rolls, square inwardly-facing shoulders on the rolls, and a square outwardly-facing shoulder on the mandrel contacting with the shoulders on the rolls and adapted to prevent endwise movement of the mandrel during the welding and shaping operation.

4. In apparatus for welding and shaping pipe-couplings or similar articles, the combination of a central mandrel, and a cluster of rolls surrounding the same, said rolls having flanges at each end adapted to contact with the mandrel and confine the blank, said mandrel corresponding in diameter to the interior of the article to be formed and having a portion of enlarged diameter at one end projecting into the pass of the rolls, a plurality of annular grooves formed in the mandrel, and a single annular bead formed on each of the rolls and adapted to coöperate with the grooves in the mandrel to prevent endwise movement thereof.

808,658. TENSION DEVICE FOR LOOMS. EDUARD HERZOG, West Hoboken, N. J. Filed Dec. 16, 1904. Serial No. 237,080.

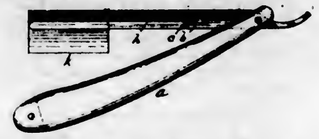


Claim.—The combination of the warp-beam A carrying the ratchet-teeth, with the grooved disk F concentric to the warp-beam and carrying spring-pressed pawl into engagement with the ratchet-teeth of the warp-beam and with the tension-adjusting arm K, having collars J, entering the annular grooves of disk F, and spring N as described.

808,659. HOLDER AND HANDLE FOR SAFETY-RAZORS. CHARLES L. HOLLAND, Boston, Mass., assignor of one-half to Charles H. Holland, Boston, Mass. Filed Dec. 29, 1904. Serial No. 238,703.

Claim.—1. As an improved article of manufacture, a holder and handle for safety-razor blades, comprising a razor-handle of the style constructed to receive the blade of an ordinary razor; a tang hinged in the ordinary manner to the razor-handle, and a holder extending from the tang and adapted to receive and hold a safety-razor blade.

2. A razor-handle; a tang connected with and extending therefrom and comprising the portion *b* and the outer portion *d* smaller in thickness than said portion *b*; and a hollow holder adapted to embrace and clamp said portion *d* of the tang, said holder being of suitable shape to receive and hold the upper or thick edge of a safety-razor blade, for the purpose set forth.



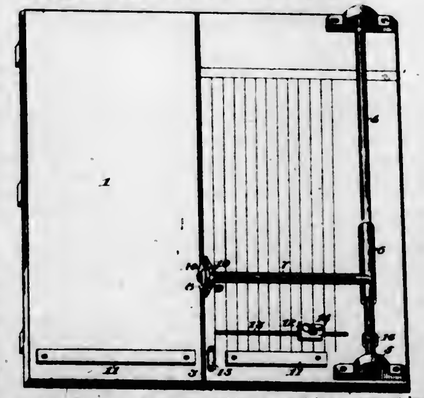
808,660. BRACING FOR VAULT-LIGHTS, FLOORS, &c. JACOB JACOBS, New York, N. Y. Filed Oct. 11, 1904. Serial No. 228,068.

Claim.—1. A vault-light, consisting of the combination of main braces having flanges, cross-braces having slots adapted to receive said flanges, said slots having contracted openings whereby both the upper and lower surfaces of said flanges are engaged in said slots, lenses having flanges adapted to rest upon said main braces, and concrete filling.

2. A vault-light consisting of the combination of main braces having flanges, cross-braces having slots adapted to receive said flanges, lenses having flanges in different planes adapted to rest both upon said main braces and upon said cross-braces, and a concrete filling.

3. A vault-light consisting of the combination of ⊥-shaped bars, cross-braces formed of T-shaped bars, said cross-braces having ⊥-shaped slots formed in and beneath the flanges thereof, said slots being adapted to receive the flanges of said main braces, lenses having lower flanges adapted to rest upon the flanges of the main braces, upper flanges adapted to rest upon the flanges of the cross-braces, and a concrete filling around the lenses and covering the braces.

808,661. PERFORATING-MACHINE. HENRY D. JACOBSON, Atlantic, Iowa. Filed June 22, 1905. Serial No. 266,495.



Claim.—1. A perforating-machine, comprising a support having a longitudinal recess and a guide, a slide having a lateral arm, and a toothed disk revolubly supported on the end of said arm in alinement with said recess, as set forth.

2. A perforating-machine, comprising a support having a longitudinal recess and a guide, a slide having a lateral arm, a toothed disk revolubly supported on the end of said arm in alinement with said recess, and a transversely-adjustable gage, as set forth.

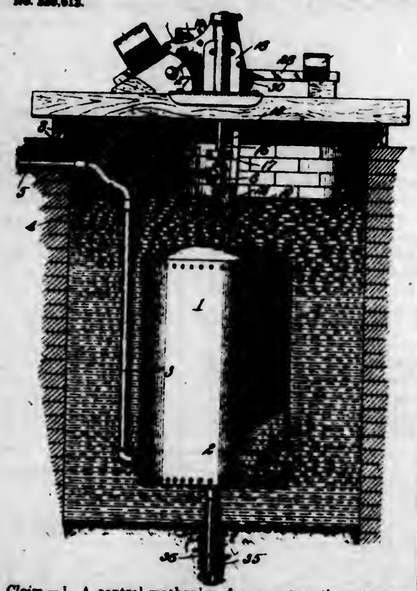
3. A perforating-machine, comprising a support having a longitudinal recess, a guide-rod mounted above said support, a slide surrounding said rod and having a lateral arm, a perforator jour-

nailed on the end of said arm, consisting of a thin toothed disk and clamping members, a fixed gage, and a transversely-adjustable gage, as set forth.

4. A perforating-machine, comprising a support, a guide having an adjustable stop, a slide having a lateral arm, and a perforator at the end of said arm, as set forth.

5. A perforating-machine, comprising a support having a longitudinal recess, a guide-rod mounted above said support, an adjustable stop-collar on said rod, a slide surrounding said rod and having a lateral arm, a perforator journaled on the end of said arm, consisting of a thin toothed disk and clamping members, a fixed gage, and a transversely-adjustable gage, as set forth.

808,662. **AUTOMATIC WATER-SUPPLY SYSTEM.** JOHN JOHNSON, Overland Park, Mo., assignor to The Country Hydrant Company, St. Louis, Mo., a Corporation of Missouri. Filed Oct. 22, 1904. Serial No. 229,612.



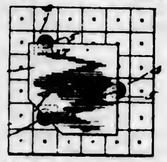
Claim.—1. A control mechanism for an automatic water-supply system which employs a vertically-movable member comprising a frame, a rod arranged to move with said vertically-movable member and provided with two projections, a lever pivotally mounted on said frame and having a bifurcated end adjacent to said rod, a dog pivotally mounted on said lever and projecting into the path of one of said projections of said rod, said dog having lateral projections resting on the upper side of the bifurcations of said lever, means to oppose downward movement of the end of said lever adjacent to said rod, a lever pivotally mounted on said frame and having a part projecting into the path of the other of said projections on said rod, and means to oppose upward movement of the end of said lever adjacent to said rod.

2. An automatic water-supply system comprising a vertically-movable submerged tank having means for admitting and discharging water and means for admitting and discharging air under pressure, a cock to control the supply of air under pressure provided with an arm, a platform, a link pivotally mounted on said platform and connected to said arm, a frame mounted on said platform, a rod connected with said tank to move therewith and extending through said frame, separated trip-collars on said rod, a lever pivotally mounted in said frame and provided with an adjustable poise, a second lever pivotally mounted on said frame bearing at one end on the free end of said first-mentioned lever and carrying at its opposite end a pivoted dog projecting into the path of the upper one of said trip-collars, and a lever pivotally mounted in said frame having on its outer end an adjustable poise and on its inner end a dog projecting into the path of the lower one of said trip-collars.

3. A control mechanism for an automatic water-supply system which employs a vertically-movable member, comprising a frame, a rod connected to said vertically-movable member and provided with two projections, a lever pivotally mounted on said frame and having a bifurcated inner end, a dog having lateral projections projecting over the bifurcations of said lever pivotally mounted on said lever and projecting into the path of one of said projections on said rod, means to resist downward movement of the inner end of said lever, a lever pivotally mounted on said frame and having a bifurcated inner end, a dog having lateral projections projecting under the bifurcations of said second-mentioned lever pivotally mounted on said second-mentioned lever and projecting into the path of the other of said projections on said rod, and means to resist upward movement of the inner end of said second-mentioned lever.

4. A control mechanism for an automatic water-supply system, which employs a vertically-movable member, comprising a frame, a rod connected to said vertically-movable member, provided with two projections and passing through and guided by said frame, a lever pivoted in said frame and provided with an adjustable weight and having a pivoted dog in position to engage one of said projections, a lever pivoted on said frame and provided with a pivoted dog in position to engage the other of said projections, and a lever pivoted on said frame and having an adjustable weight on one end and engaging said second-mentioned lever at its other end, said dogs being arranged to move their respective levers in one direction and to move with respect to their respective levers in the other direction.

808,663. **PRINTER'S REGISTER-HOOK.** JAMES E. LEE, Grand Haven, Mich. Filed Nov. 19, 1904. Serial No. 233,286.

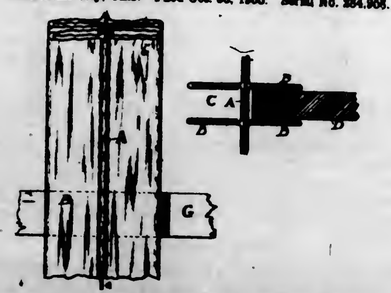


Claim.—1. In a printer's register-hook, the combination of a body or block, a second block rotatable in said first block on a vertical axis, and a clutch member mounted on and movable in said second block in a longitudinal direction.

2. In a printer's register-hook, the combination of a body or block having a recess therein provided with a flange at one end, a second block journaled in said recess and having a rabbet at one edge receiving said flange, a ring secured in the opposite end of the recess engaging and holding said second block, and a clutch device mounted on said second block and movable longitudinally.

3. In a printer's register-hook, the combination of a body or block having a recess, a second block journaled in said recess and having its faces flush with the faces of said first block respectively, and a clutch device mounted in said second block and movable longitudinally.

808,664. **SHEET-METAL BUILDING STRUCTURE.** THOMAS LEE, Home City, Ohio. Filed Oct. 30, 1905. Serial No. 284,958.

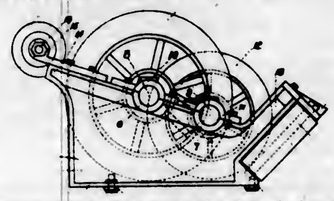


Claim.—1. A building structure, consisting of a central web having projecting from each side of it and between the edges thereof, two spaced ribs, all of said members consisting of layers of sheet metal and held together by parts of the layers of one member engaging with and overlapping parts of the layers of the other member.

2. A building structure, consisting of a central web having projecting from each side of it and between the edges thereof, two spaced ribs, said parts consisting of tripled layers of sheet metal.

3. A sheet-metal building structure, consisting of an inner stiffening member, U-shaped members on each side thereof projecting with their free edges outwardly therefrom and outer connecting members, one on each side, engaging simultaneously one of the edges of the inner member and one of the edges of each of the U-shaped members, all as shown and described.

808,665. **HEAD-BLOCK.** HARRY C. LEDERLY, Kansas City, Mo. Filed Feb. 20, 1904. Serial No. 194,004.



Claim.—1. In a head-block, a series of standards, means for joining said standards to form a frame and pulleys carried by said frame.

2. In a head-block, a series of standards, means for joining said standards to form a skeleton frame, a shaft mounted in boxings on said standards, and a pulley mounted on said shaft between two of said standards.

3. In a head-block, a series of standards, bars joining said standards and securing same together to form a frame, cut-out portions in said standards, a shaft mounted in said cut-out portions, plates, having semicircular portions therein, secured to said standards and forming, with the cut-out portions in said standards, boxings for said shaft, and a pulley mounted on said shaft.

4. In a head-block, a series of standards, means for joining said standards to form a frame, arms on the ends of said standards, means on said arms for carrying rollers, rollers carried by said means, and pulleys mounted in said frame.

5. In a head-block, a series of standards, means for joining said standards to form a frame, arms on the ends of said standards, seats on said standards adjacent to and extending at an angle with said arms, a plate secured to the outer ends of said arms, and rollers mounted between said seats and said plate.

6. In a head-block, a series of standards, means for joining said standards to form a frame, arms on, and extending at an angle with said standards, seats on said standards, at the bases of and extending at an angle with said arms, a plate secured to the tops of said arms, shafts mounted between said seats and said plate, and rollers mounted on said shafts.

7. In a head-block, a series of standards forming a suitable frame, arms on said standards, a plate secured to said arms, an ear on said plate, shafts having one of their upper ends carried by said ear and the other by a suitable base on said standard, and rollers mounted on said shafts.

8. In a head-block, a series of standards forming a suitable frame, arms on said standards, a plate secured on said arms, an ear having a concaved portion, on said plate, and rollers mounted between said ear and a base on said standard.

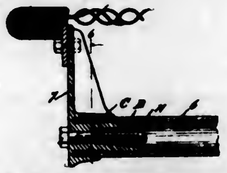
9. In a head-block, a series of standards forming a suitable frame, arms on said standards extending upwardly and outwardly therefrom, a seat on said standards extending from said arms and in a plane parallel with the upper faces of said arms, a plate secured to the upper faces of said arms, an ear on said plate, a series of shafts mounted in said ear and in said seats, and rollers carried by said shafts.

10. In a head-block, a suitable frame, pulleys journaled on said frame, plates having slots therein adjustably mounted on the rear of said frame by means of bolts passing through said slots and into said frame, means on the outer ends of said plates for carrying a shaft, a shaft carried by said means, and a pulley mounted on said shaft.

808,666. **PROTECTOR FOR BOOTS AND SHOES.** CHARLES W. LITTLETON, Baltimore, Md., assignor to George S. Littleton, Baltimore, Md. Filed Nov. 5, 1904. Serial No. 231,854.

Claim.—The combination of a shoe, the upper of said shoe slitted at the front thereof, a fastening joining the slitted parts of said upper together, a lagging extending upwardly from said shoe, a protector fast to said lagging and projecting over the top of said shoe, said protector consisting of a strip of sheet material and a piece of elastic fabric joining the two ends of said sheet material, said elastic fabric extending downwardly below the top edge of said shoe and engaging said fastening.

808,667. **SPRING-BED.** GEORGE C. LOCKLIN, Hammond, Ind. Filed Feb. 27, 1905. Serial No. 247,485.



Claim.—1. The combination with an end rail and a side rail of a spring-bed, of a bracket secured to said end rail and provided with a socket to receive the end of the side rail, means integral with said bracket for clamping said side rail into position, and means for operating said clamping device.

2. The combination with a bracket provided with a socket, of a member adapted to fit within said socket, means integral with said bracket for supporting said member, and means for spreading one of said elements into clamping contact with the other of said elements.

3. The combination with a bracket provided with a divided lug and with a socket surrounding said lug, of means adapted to fit over said lug and to be seated in said socket, and means for spreading said lug so as to clamp said bracket into permanent engagement with said member.

4. The combination with an end rail of a spring-bottom, of a side rail, a bracket secured to one of said members and adapted to engage the other of said members, said bracket being provided with a divided lug, over which one of said members is adapted to fit, and with a socket surrounding said lug and arranged to receive the end of one of said members, and means for spreading said lug so as to lock the parts together.

5. The combination with an end rail, of a bracket secured thereto, said bracket being provided with a divided lug and with a socket surrounding said lug, a tubular side rail adapted to fit over said lug and into said socket, and means for spreading said lug so as to secure said side rail to said bracket.

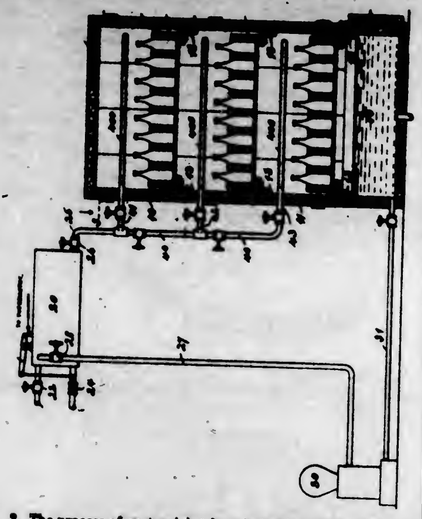
6. As a new article of manufacture, a corner-casting comprising a body portion adapted to be secured to one rail of a bed-frame and provided with an integral divided lug constructed and arranged to be inserted in the end of another rail of a bed-frame and to be expanded therein, and a flange surrounding said divided lug so as to provide a socket arranged to receive the end of the rail within which said lug may be inserted.

7. As a new article of manufacture, a corner-bracket for a bed-frame, comprising a body portion, and an integral divided lug extending at right angles thereto, said lug being arranged and constructed to be inserted within one end of a hollow rail and to be expanded therein.

808,668. **PROCESS OF PASTEURIZING BEER.** CHARLES H. LOUP, Lakewood, Ohio. Filed Feb. 8, 1905. Serial No. 244,889.

Claim.—1. The process of pasteurizing beer in bottles which

comprises subjecting the bottles contained in a suitable chamber to a spray of water of progressively-increasing temperature until a predetermined temperature is arrived at.



2. The process of pasteurizing beer in bottles which consists in subjecting the bottles contained in a suitable chamber to a spray of water of progressively-increasing temperature until a predetermined temperature is arrived at and maintaining the spray at the chosen temperature for a sufficient time to pasteurize the beer in the bottles.

3. The process of pasteurizing beer in bottles which consists in subjecting the bottles contained in a suitable chamber to a spray of water of progressively-increasing temperature until a predetermined temperature is arrived at, maintaining the spray at the chosen temperature for a sufficient time to pasteurize the beer in the bottles, and finally subjecting the bottles to a spray of a gradually-decreasing temperature.

4. The process of pasteurizing beer in bottles which comprises subjecting the bottles contained in a suitable chamber to a spray of water of progressively-increasing temperature until a predetermined temperature is arrived at, and securing said increasing temperature by repeatedly passing the water so used for the steam-heating medium.

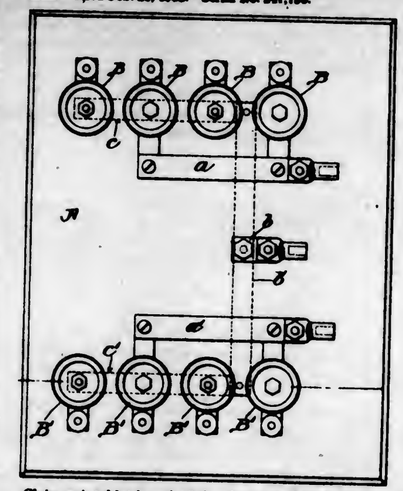
5. The process of pasteurizing beer in bottles which comprises subjecting the bottles contained in a suitable chamber to a spray of water of progressively-increasing temperature until a predetermined temperature is arrived at, and securing said increase of temperature by repeatedly passing the water so used through a water-tempering chamber provided with a suitable source of heat.

6. The process of pasteurizing beer in bottles which comprises subjecting the bottles contained in a suitable chamber to a spray of water of progressively-increasing temperature until a predetermined temperature is arrived at, and securing said increase of temperature by repeatedly passing the water so used through a water-tempering chamber provided with a suitable source of heat, and providing means for governing the admission of heat energy to the tempering-chamber.

7. The process of pasteurizing beer in bottles which consists in subjecting the same to the action of a spray of water at or near the normal temperature, heating the water-supply to the spray gradually to a predetermined temperature, maintaining the temperature of the water a predetermined suitable time, and withdrawing the heat therefrom after the lapse of said time.

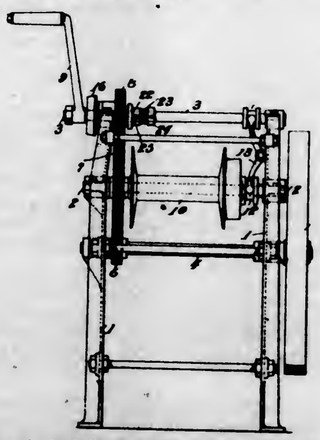
8. The process of pasteurizing beer in bottles which consists in placing the same in a suitable closed chamber, subjecting the same to the action of a spray of water, which water has previously been heated in a tempering-chamber, returning the water after it has been brought into contact with the bottles to the tempering-chamber, gradually raising the temperature of said tempering-chamber until the spray falls upon the bottles at a predetermined temperature and maintaining that temperature a suitable length of time at such degree of warmth that the beer within the bottles will be pasteurized.

808,669. TABLET-BOARD. CHARLES B. HAMPLAIR, Waltham Mass. Filed Feb. 28, 1905. Serial No. 247,799.



Claim.—A tablet-board of the character described comprising a tablet; three terminals fixed to the tablet; a pair of bus-bars fixed to the top face of the tablet and connected with two of the terminals, each bar being branched and each branch adapted to be connected with a fuse; a bus-bar on the opposite side of the tablet and connected with the other terminal, said bar being branched and each branch adapted to be connected with a fuse, all of the bars and terminals being separated and insulated so as to adapt the board for use under different conditions of voltage.

808,670. WINDLASS. THOMAS F. MASON, Colonial Beach, Va., assignor of one-half to Thomas Parry Watson, Colonial Beach, Va. Filed Feb. 17, 1905. Serial No. 246,168.



Claim.—1. A windlass comprising a drum, a shaft therefor, a clutch for locking said drum to its shaft, means for operating the latter, a fly-wheel actuated by the revolution of the drum-shaft, and means for releasing and reapplying said clutch without interfering with the revolutions of the drum-shaft and fly-wheel, whereby the momentum of the latter may be utilized in renewing the winding operation after the drum has been released from its shaft.

2. A windlass comprising a drum, a shaft therefor, a clutch for locking said drum to its shaft, means for operating the latter, a second shaft geared to the drum-shaft, a fly-wheel on said second shaft, and means for releasing and reapplying said clutch without interfering with the revolutions of the drum-shaft and fly-wheel, whereby

the momentum of the latter may be utilized in renewing the winding operation after the drum has been released from its shaft.

3. A windlass comprising a drum, a shaft therefor, a clutch for locking said drum to its shaft, means for operating the latter, a second shaft geared to the drum-shaft, a fly-wheel on said second shaft, a counter-shaft also geared to said drum-shaft, means for operating said counter-shaft, and means actuated by the latter for releasing and reapplying said clutch without interfering with the revolutions of the drum-shaft and fly-wheel.

4. The combination with the drum-shaft, the drum thereon, and a clutch for securing said drum to its shaft, of a counter-shaft geared to the drum-shaft, said counter-shaft being capable of being moved longitudinally, to apply and release said clutch, means actuated thereby for operating the latter, and means for aiding the initial winding operation after a temporary cessation thereof.

5. The combination with the drum-shaft, the drum thereon, and a clutch for securing said drum to its shaft, of a counter-shaft geared to the drum-shaft, said counter-shaft being capable of being moved longitudinally, means actuated thereby for operating said clutch, and a fly-wheel actuated by the revolution of said drum-shaft.

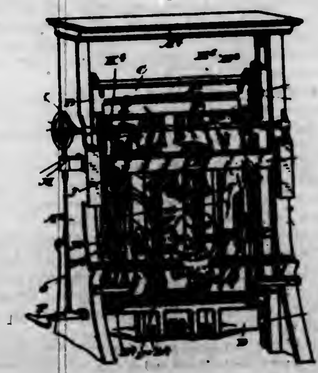
6. The combination with the drum-shaft, the drum thereon, and a clutch for securing said drum to its shaft, of a counter-shaft, a gear-wheel therefor having an interiorly-threaded hub, an exteriorly-threaded sleeve on said shaft working in the thread of said hub, means for locking said sleeve to and disengaging it from said shaft and also locking it to said gear-wheel, said shaft being movable longitudinally, and means actuated thereby for operating said clutch.

7. The combination with the drum-shaft, the drum thereon, and a clutch for securing said drum to its shaft, of a counter-shaft, a gear-wheel therefor having an interiorly-threaded hub, an exteriorly-threaded sleeve on said shaft working in the thread of said hub, means for locking said sleeve to and disengaging it from said shaft and also locking it to said gear-wheel, said shaft being movable longitudinally, means actuated thereby for operating said clutch, and a fly-wheel actuated by the revolution of said drum-shaft.

8. The combination with the longitudinally-movable shaft, of the gear-wheel having a fixed bearing, said gear-wheel having its hub interiorly threaded, an exteriorly-threaded sleeve working in said hub, means carried by said shaft for locking it to said sleeve when moved in one direction, said sleeve being then locked to said gear-wheel, and means for allowing said sleeve to turn with said gear-wheel independently of said shaft when the latter is unlocked therefrom.

9. The combination with the longitudinally-movable shaft, of the gear-wheel having a fixed bearing, said gear-wheel having its hub interiorly threaded, an exteriorly-threaded sleeve working in said hub, means carried by said shaft for locking it to said sleeve when moved in one direction, said sleeve being then locked to said gear-wheel, and a spring-pressed collar movable on and carried by said shaft and with which said sleeve is designed to engage when locked to said gear-wheel, said collar being disengaged from said sleeve when the latter and the shaft are moved longitudinally and said collar is brought into frictional engagement with such wheel.

808,671. GANG-SAW FOR MANUFACTURING LUMBER. GEORGE B. MILLER, Parry Sound, Canada. Filed Mar. 27, 1905. Serial No. 252,575.



Claim.—1. In a gang-sawing machine, the combination with the gate and top and bottom rails thereof deriving a reciprocating movement as specified, of the harps provided with the side recess and a bridging-bar for the same and means connected to such bar for adjusting the harps laterally as and for the purpose specified.

2. In a gang-sawing machine, the combination with the gate and top and bottom rails thereof deriving a reciprocating movement as specified, of the harps provided with the side recess and a bridging-bar for the same, a bracket straddling such bar and provided with a depending portion, a guide-bar secured to the standard and extending through an opening in such bar and means for adjusting the straddle-bracket as and for the purpose specified.

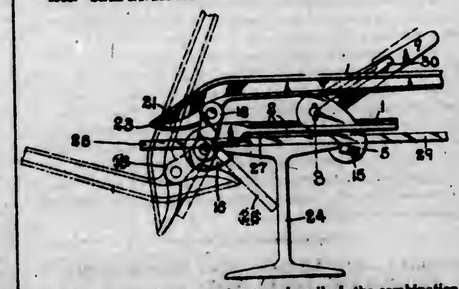
3. In a gang-sawing machine, the combination with the gate and top and bottom rails thereof deriving a reciprocating movement as specified, of the harps provided with the side recess and a bridging-bar for the same, a bracket straddling such bar and provided with a depending portion, a guide-bar secured to the standard and extending through an opening in such bar, means for adjusting the straddle-bracket and set-screws for taking up the wear of the bracket on the supporting-bar as and for the purpose specified.

4. In a gang-sawing machine, the combination with the gate and top and bottom rails thereof deriving a reciprocating movement as specified, of the harps provided with the side recess and a bridging-bar for the same, a bracket straddling such bar and provided with a depending portion, a guide-bar secured to the standard and extending through an opening in such bar, a lever suitably pivoted on the frame and provided with a forked end engaging with a pin on the depending portion of the straddle-bracket and means for tilting each lever simultaneously oppositely as and for the purpose specified.

5. In a gang-sawing machine, the combination with the gate and top and bottom rails thereof deriving a reciprocating movement as specified, of the harps provided with the side recess and a bridging-bar for the same, a bracket straddling such bar and provided with a depending portion, a guide-bar secured to the standard and extending through an opening in such bar, a lever suitably pivoted on the frame and provided with a forked end engaging with a pin on the depending portion of the straddle-bracket, a worm formed on the one end of the lever, a cross-shaft journaled in the frame and provided with worms one a right-hand and the other a left-hand worm engaging with the worm-racks on the end of the lever and means for turning the shaft and holding it in the position to which it is turned as and for the purpose specified.

6. In a gang-sawing machine, the combination with the gate and top and bottom rails thereof deriving a reciprocating movement as specified, of the harps provided with the side recess and a bridging-bar for the same, a bracket straddling such bar and provided with a depending portion, a guide-bar secured to the standard and extending through an opening in such bar, a lever suitably pivoted on the frame and provided with a forked end engaging with a pin on the depending portion of the straddle-bracket, a worm formed on the one end of the lever, a cross-shaft journaled in the frame and provided with worms one a right-hand and the other a left-hand worm engaging with the worm-racks on the end of the lever, a hand-wheel on the end of the shaft provided with notches and a spring-pressed plunger manipulated to engage such notches as and for the purpose specified.

808,672. BENDING-MACHINE. RICHARD MOSLEY, St. Louis, Mo., assignor of one-half to D. B. Ridpath, St. Louis, Mo. Filed May 8, 1905. Serial No. 259,266.



Claim.—1. In a device of the class described, the combination with a base having a rack thereon, a fixed flange-engaging means

carried by said base, an adjustable flange-engaging means coöperating with the rock, and a tie-rod-bending member carried by said base; substantially as described.

2. The combination with a base having a hooked portion at one end, means for anchoring the base to a beam and adjustable on said base, a pawl-and-rock mechanism for holding said means in an adjustable position, and a bending element carried by said base; substantially as described.

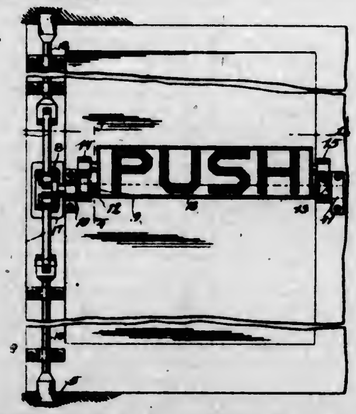
3. In a device of the class described, the combination with a base, an anchor member carried by said base, links connected to the respective sides of the base, and a bender secured to the ends of the links distant from the base and movable on the arc of a circle from a position above the base to a position below the base; substantially as described.

4. In a device of the class described, the combination with a base having a hooked portion at one end for engagement with a flange, and adjustably-movable flange-engaging hooks coöperating with the base near the other end, and a pivoted tie-rod-bending means carried by the base; substantially as described.

5. The combination with a base having a fixed hooked portion and an adjustable hooked portion, of a pivoted tie-rod-bending element carried by said base and movable in the arc of a circle; substantially as described.

6. The combination with a base, of a fixed anchor member on the base, said base having elongated slots, hooked members guided in said slots for engagement with the flange of a girder or beam, and a pivoted member carried by said base at one end thereof; substantially as described.

808,673. DOOR-BOLT AND MEANS FOR OPERATING THE SAME. WILLIAM B. MORRWOOD, Elizabeth, N. J. Filed Oct. 31, 1904. Serial No. 230,669.

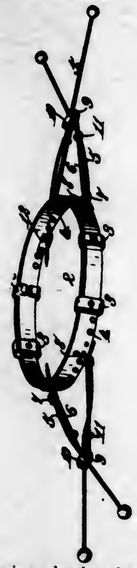


Claim.—1. In a door-lock, the combination of a shaft parallel to and extending across the door; said shaft rotatably mounted in bearings which are fixed to the door; a push-plate to rotate the shaft extending across the door and carried by outwardly and upwardly extending arms fixed to said shaft; a circular plate rigidly fixed to the end of the shaft; one or more links pivotally connected to said circular plate outside the axis of the shaft; a bolt pivotally connected with each of said links; and guides on said door for said bolts.

2. In a door-lock, the combination of a shaft parallel to and extending across the door; said shaft rotatably mounted in bearings which are fixed to the door; a push-plate to rotate the shaft extending across the door and carried by outwardly and upwardly extending arms fixed to said shaft; a circular plate rigidly fixed to the end of the shaft and having its rim extending within the face of the door into a countersunk opening provided therefor; one or more links pivotally connected to said circular plate outside the axis of the shaft; a bolt pivotally connected with each of said links; and guides on said door for said bolts.

808,674. HAT-FASTENER. JOHN C. MONTGOMERY, Louisville, Ky. Filed Apr. 11, 1905. Serial No. 255,619.

Claim.—1. A hat-fastener having a band, and two pairs of opposing crossing pins associated with the band and movable inwardly and outwardly across the space bounded by the band said pins engaging at their place of intersection.



2. A hat-fastener having a band, and two pairs of opposing crossing pins associated with the band and movable inwardly and outwardly across the space bounded by the band said pins engaging at their place of intersection, the latter being circumferentially adjustable.

3. A hat-fastener having a band, a pin arranged to be projected across the space bounded by the band, and guiding devices for the pin, separated from each other longitudinally of said pin, one of said guiding devices being located at a point outward from and separated from the band.

4. A hat-fastener having a band, a pin arranged to be projected across the space bounded by the band, and guiding devices for the pin, separated from each other longitudinally of said pin, one of said guiding devices being located at a point outward from and separated from the band, and the pin having a head outward beyond said outer guiding device.

5. A hat-fastener having a band, two pairs of opposing crossing pins associated with the band and movable inwardly and outwardly across the space bounded by the band, and each having a curved inner end, and means for positively causing the pins to turn as they are moved inward.

6. A hat-fastener having a band, and a pin movable inwardly and outwardly across the space bounded by the band, the inner portion of the pin being curved, and means for causing the pin to positively turn as it is moved inward.

7. A hat-fastener having a band, a pin mounted to have its inner end drawn back to be substantially flush with the inner surface of the band and to be projected across the space bounded by said band from a point outside the latter, and means for supporting the pin for endwise movement.

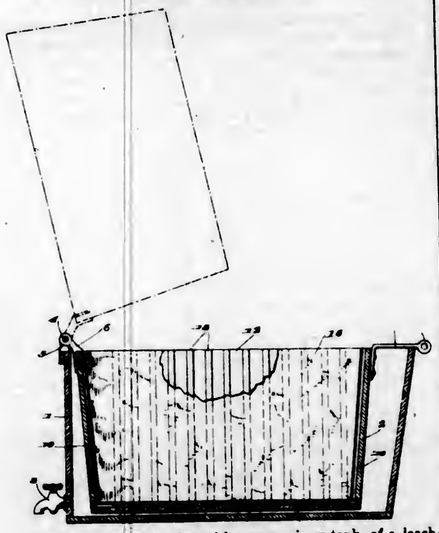
8. A hat-fastener having a foundation, and two pairs of opposing crossing pins supported by the foundation and arranged to be moved into and out of the hair, and means for positively causing the pins to turn as they are moved inward.

9. A hat-fastener having a band, two pairs of opposing crossing engaging pins, arranged to be moved into and out of the hair, and guiding devices for each pair of pins in which they respectively cross and are supported at a point outward beyond the band.

10. A hat-fastener having a band, two pairs of wires attached to the band at opposite sides thereof and having coiled portions near the band, said pairs of wires converging outward, upper and lower stripe joining the said wires, crossing pins passing through the stripe and through said coils and arranged to be projected across the space bounded by the band.

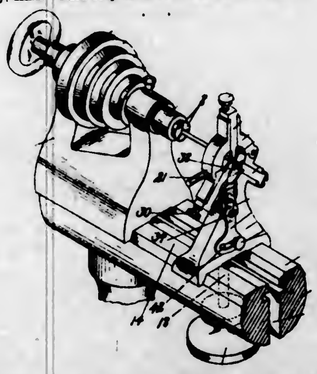
11. A hat-fastener having a band, two pairs of wires attached to the band at opposite sides thereof and having coiled portions near the band, said pairs of wires converging outward, upper and lower stripe joining the said wires, crossing pins passing through the stripe and through said coils and arranged to be projected across the space bounded by the band, said pins having eyes between their ends, slidable upon the wires.

808,675. LEACHING-TANK. ANDREW B. MOOCK, Twisp, Wash., assignor of two-thirds to Robert S. Lewis and Treadwell Twichell, Fargo, N. D. Filed Dec. 15, 1904. Serial No. 236,967.



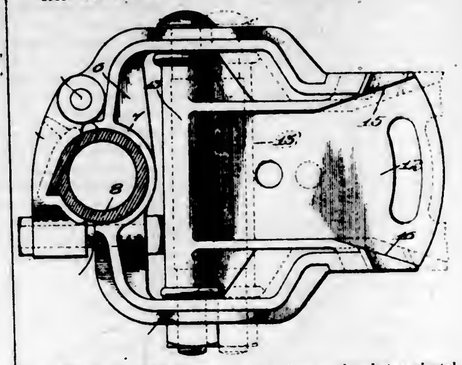
Claim.—The combination with a reservoir or tank, of a leaching-tank pivotally suspended therein and held out of contact therewith and adapted for dumping movement, said tank comprising a plurality of compartments each having a perforated bottom, slats or spacers secured to the four walls and bottom of each compartment, and a filtering medium disposed within each compartment and held out of contact with the walls and bottom thereof by the slats.

808,676. WORK-REST FOR LATHES. WILLIAM F. PARSONS, Beverly, Mass. Filed May 10, 1905. Serial No. 259,732.



Claim.—In a work-rest, a standard provided with a plurality of adjustable work-engaging members, a stud fastened to said standard and provided with a ball-shaped head, a support having a split socket which receives the head of said stud, an adjusting-screw for causing the members comprising said socket to bind upon the head of said stud, a tool-rest vertically and rotatably mounted in said support, and means for holding said tool-rest in adjusted position.

808,677. COUPLING FOR AGRICULTURAL IMPLEMENTS, &c. WILLIAM L. PAUL, Bradley, Ill., assignor to David Bradley Manufacturing Company, Bradley, Ill., a Corporation of Illinois. Filed Apr. 17, 1905. Serial No. 256,023.



Claim.—1. A coupling, comprising a frame, a bracket, a pivotal connection between said frame and bracket, and means for rigidly connecting said frame and bracket.

2. A coupling, comprising a frame, a bracket, a pivotal connection between said frame and bracket, and means carried by said frame for rigidly connecting said frame and bracket.

3. A coupling, comprising a frame, a bracket, and a pivotal connection between said frame and bracket, said bracket being movable into or out of position to rigidly engage said frame.

4. A coupling, comprising a frame, a bracket adapted to fit therein and movable into and out of locking engagement therewith, and a pivotal connection between said frame and bracket.

5. A coupling, comprising a U-shaped frame, a bracket adapted to fit therein and movable into and out of locking engagement therewith, and a pivotal connection between said frame and bracket.

6. A coupling, comprising a U-shaped frame having notches in one or both ends thereof, a bracket adapted to fit in said frame and movable into and out of said notches, and a pivotal connection between said frame and bracket.

7. A coupling, comprising a U-shaped frame having notches in one or both ends thereof, a bracket adapted to fit therein, said bracket having inclined edges movable into or out of said notches, and a pivotal connection between said frame and bracket.

8. A coupling, comprising a frame, a bracket, a swinging arm pivotally connected with said frame and coacting therewith to form a latch, and means for connecting the free end of said arm with said frame.

808,678. HAY AND MANURE GATHERER AND LOADER. JOHN PETERSON, St. Paul, Minn. Filed June 13, 1904. Serial No. 212,317.

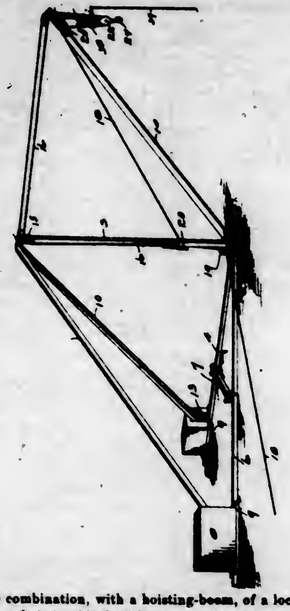
Claim.—1. The combination, with the base-plate, of an upright mast supported thereon, a boom for said mast, base-timbers connected to said base-plate upon each side of said boom, the connection of one of said timbers allowing it to be swung back and forth toward and from the other timber, bracing-beams connecting the outer ends of said base-timbers and the top of said boom, and a cross-bar connecting said base-timbers intermediate to their ends, for the purpose specified.

2. The combination, with a gathering-fork, of a pulley-block connected therewith, jaws pivoted on said block and having notched upper ends, a spring yieldingly holding said jaws together, a hoisting-boom, a block carried by said hoisting-boom and arranged to enter the notches in said jaws and support said pulley-block, means for separating said jaws, and a hoisting-cable.

3. The combination, with a gathering-fork, of a pulley-block thereon, jaws pivoted on said block and having notched upper ends, a hoisting-boom, means carried by said boom and adapted to enter said notches and support said pulley-block in its raised position, means for separating said jaws to disengage them from said supporting means, and a hoisting-cable.

4. The combination, with a hoisting-boom, of a jaw-support thereon, a hoisting-cable, a pulley-block carried thereby, jaws pivoted at their lower ends on said pulley-block and having ends pro-

vided with notches adapted to receive said support and lock said pulley-block in its raised position, means for yieldingly holding said jaws together, and a trip-lever for separating them.



5. The combination, with a hoisting-boom, of a locking-block 27, thereon, a hoisting-block 22 having a cable 18, jaws pivoted on said hoisting-block and engaging said block 27, a spring 32 normally holding said jaws together, and a trip-lever.

6. The combination, with a hoisting-boom, of a hoisting-block and its cable, a support having a fixed pivot on said boom, jaws pivoted on said hoisting-block and having notched upper ends to engage said support and automatically lock said hoisting-block in its raised position, means for yieldingly holding said jaws together, and means for separating them.

7. The combination, with a suitable handle, of the bars secured thereon, a fork pivoted between said bars and comprising cross-bars 44 and 46, a suitable bail for said fork, and trucks pivoted between the tines of said fork on each side thereof, for the purpose specified.

8. The combination, with the fork-tines, of depending straps secured thereon and provided with a series of holes, trucks provided between said straps, and pins passing through said holes and said trucks and said pins being adapted to fit either of the holes in said straps to allow the adjustment of the trucks between them, for the purpose specified.

9. The combination, with the cross-bars 44 and 46 and the tines 45 secured thereto and provided with upwardly-curved inner ends, and the guard-plates 56 secured to the curved ends of the outer tines upon each side of said fork.

10. The combination, with the bars 41 and the fork pivoted between, of a bail 50 also pivoted between said bars, and stops 51 pivoted on said fork and adapted to be swung out into the path of said bail, for the purpose specified.

11. The combination, with a fork having a series of gathering-tines and a suitable bail, of carrying-trucks adjustably secured on said fork and arranged to be raised or lowered to vary the height of said tines from the ground, for the purpose specified.

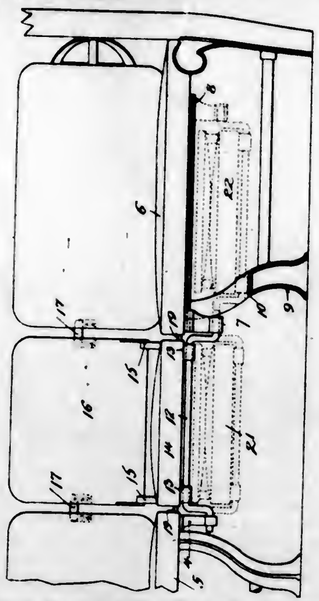
12. The combination, with a hoisting-boom, of a pulley-block, a hoisting-cable therefor, a locking device interposed between said pulley-block and said boom and comprising a catch or stop that is fixed with respect to said boom, and spring-pressed arms arranged to be operated automatically to engage said stop and lock said pulley-block when it has been raised to a certain predetermined point, and mechanism for tripping said jaws to release said block.

13. The combination, with a fork having a series of gathering-tines, of carrying-trucks mounted on said fork and capable of vertical adjustment to vary the height of said tines from the ground, substantially as described.

14. The combination, with a hoisting-boom, of a hoisting block and cable, a support, jaws pivoted on said hoisting-block and having notches or recesses extending partially through their contiguous faces and adapted to engage said support when said block is raised, and means for separating said jaws to release said block.

15. The combination, with a hoisting-boom, of a jaw-support thereon, a block having a cable and locking-jaws to engage said support, and a trip-lever mounted on one of said jaws and arranged to actuate the other jaw to separate them, substantially as described.

808,679. DISAPPEARING SEAT. CHARLES K. PICKLES, Philadelphia, Pa., assignor to John A. Brill, Philadelphia, Pa. Filed Feb. 9, 1905. Serial No. 244,883.



Claim.—1. In a device of the class described, a cushion, a seat at each end of said cushion, suspended and pivoted means for supporting said cushion between said seats, and means for lowering said cushion and storing it under one of said seats.

2. In a device of the class described, a seat-cushion, seats at each end of said cushion, brackets suspended from said seats, crank-shafts journaled in said brackets and means for supporting said cushion on said crank-shafts.

3. In a device of the class described, a cushion, a seat at each end of said cushion, a back hinged to said cushion, latches adapted to engage parts of said seats and secure said back in its proper position, crank-shafts journaled in parts of said seats and means for uniting said cushion and crank-shafts.

4. In a device of the class described, a cushion, seats at each end of said cushion, fixed brackets suspended from one of such seats, movable brackets suspended from the other of said seats, crank-shafts journaled in said brackets and means for supporting said cushion on said crank-shafts.

5. In a device of the class described, a cushion, seats at each end of said cushion, fixed brackets suspended from one of said seats, movable brackets suspended from the other of said seats, crank-shafts adapted to be journaled in said brackets, means for uniting said cushion and crank-shafts and a bifurcated support at one end of the seat having movable brackets.

808,680. AIR-GUN. DAVID F. POLLEY, Plymouth, Mich., assignor to Markham Air Rifle Company, Plymouth, Mich. Filed Dec. 19, 1904. Serial No. 237,573.

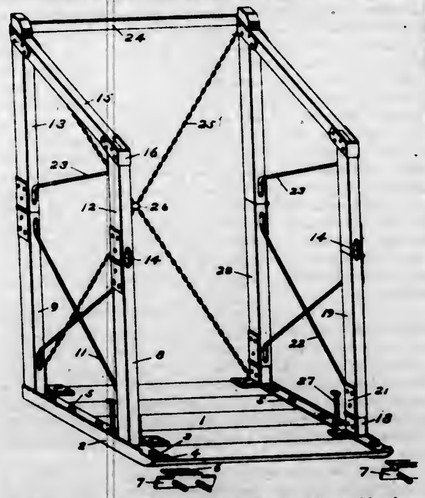
Claim.—1. A spring air-gun comprising a false barrel formed in two sections of different diameter, the rear section inclosing the piston and its actuating-spring and the forward section inclosing the true barrel, said sections being telescoped at their adjoining ends and rigidly secured to each other and a piston-abutment within said barrel bearing against the inner end of said forward section and provided with a socket for receiving the true barrel and a tapering bore in rear of said socket, the forward end of said plug being concaved to direct said true barrel into its socket.

2. A spring air-gun comprising a false barrel formed in two sections of different diameter having their adjoining ends telescoped, a tubular open-ended bushing fitting between said tubes and being rigidly secured thereto, and a piston-abutment fitting within the larger tube and seated against the annular shoulder, formed by the smaller tube and said bushing.

3. A spring air-gun comprising a false barrel formed in two sections of different diameter, telescopically engaged at their adjoining ends and rigidly secured to each other, and a piston-abutment within said barrel seated against the annular shoulder formed by the inner end of the smaller tube, said abutment having a forward extension of reduced diameter fitting within the smaller tube.

4. A spring air-gun comprising a false barrel formed in two sections of different diameter, telescopically engaged at their adjoining ends, a bushing between the engaged portions of said tubes and rigidly secured to each, a piston-abutment within said barrel seated against the annular shoulder formed by the inner end of the smaller tube and the bushing, said abutment having a forward extension fitting within the smaller tube and underlapping the joint.

808,681. COLLAPSIBLE WINDOW-PLATFORM. ERNEST G. RAFF, New York, N. Y. Filed Aug. 20, 1904. Serial No. 221,483.



Claim.—1. In a device of the class described, in combination, a floor, rigid frames connected to the same upon either side thereof, rigid extensions mounted upon each of said frames, and a rigid bar pivotally connecting said extensions, said extensions being hinged to said frames and said frames having a hinged connection with said floor.

2. In a device of the class described, in combination, a floor, rigid frames having a hinged connection with the same upon either side thereof, rigid extensions having a hinged connection with said rigid frames, and flexible members connecting the rear portions of said extensions and said floor.

3. In a device of the class described, in combination, a floor, rigid frames having a hinged connection with the same upon either side thereof, rigid extensions having a hinged connection with each of said frames, flexible members connecting the rear portions of said frames and said extensions, and a rigid bar pivotally connecting the upper portions of said extensions, said bar being adapted to swing in a plane substantially parallel to the rear or outer edge of said floor.

4. In a device of the class described, in combination, a floor, channel-shaped end members within which the ends of said floor are embraced, retaining devices upon said end members formed integral therewith, bolts passing through said floor and the upper and lower portions of said channel-shaped members, rigid frames mounted upon said floor at either side thereof and adapted to collapse with reference thereto, rigid extensions mounted upon said frames and having a hinged connection therewith, and a rigid bar pivotally connected to the upper end of said extensions.

5. In a device of the class described, in combination, a floor having channel-shaped end members, retaining devices formed integral with said end members, rigid frames having a hinged connection with said floor and mounted thereon at either side thereof, extensions mounted upon said rigid frames, flexible connecting members diagonally connecting the rear portions of said floor with said extensions, and a rigid bar pivotally connecting said extensions.

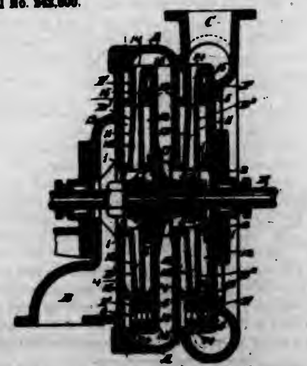
6. In a device of the class described, in combination, a floor, channel-shaped end members having retaining means formed integral therewith, rigid frames hinged to said floor at unequal distances from the plane of the lower surface thereof, rigid extensions mounted upon said frames, and means whereby the rear portions of said floor and said extensions are connected.

7. In a device of the class described, in combination, a floor, channel-shaped end members within which the ends of said floor are secured, retaining devices formed integral with said channel-shaped end members, rigid frames having a hinged connection with said floor at unequal distances from the plane of the lower surface thereof, rigid extensions mounted upon said frames and having a hinged connection therewith, a rigid member pivotally connecting said extensions, and flexible means whereby the rear portions of said extensions and said floor are connected.

8. In a device of the class described, in combination, a floor, channel-shaped end members embracing the same and resting in contact with the upper and lower surfaces thereof, retaining means formed integral with said end members, adjustable screws passing through said floor and the upper and lower portions of said channel-shaped members substantially at right angles thereto, rigid frames hinged to the opposite sides of said floor, rigid extensions hinged to said frames, and a rigid bar pivoted to said extensions.

9. In a device of the class described, in combination, a floor, a rigid frame hinged thereto at one side thereof, a pair of blocks rigidly secured to said floor at the opposite side thereof, a rigid frame hinged to said blocks, rigid extensions mounted upon each of said frames and having hinged connection therewith, a rigid bar pivoted to the upper end of each of said extensions, and flexible means adapted to connect the rear portions of each of said extensions with the floor at the opposite side from said extensions.

808,682. CENTRIFUGAL, TURBINE, OR SIMILAR PUMP. FREDERICK RAY, East Orange, N. J., assignor to Henry R. Worthington, New York, N. Y., a Corporation of New Jersey. Filed Jan. 25, 1905. Serial No. 242,600.



Claim.—1. A centrifugal, turbine or similar pump having an inclosed impeller and a pressure-equalizing connection between the opposite sides of the impeller.

2. A multistage centrifugal, turbine or similar pump having a plurality of inclosed impellers and a pressure-equalizing connection between the opposite sides of each impeller.

3. A centrifugal, turbine or similar pump having an inclosed impeller and diffusing-vanes outside the impeller and a pressure-equalizing connection between the opposite sides of the impeller formed through the diffusing-vanes.

4. A multistage centrifugal, turbine or similar pump having a plurality of inclosed impellers and diffusing-vanes outside the impellers, and a pressure-equalizing connection between opposite sides of each impeller formed through the diffusing-vanes.

5. In a centrifugal, turbine or similar pump, the combination with an inclosed impeller taking suction on one side of the impeller, of a pressure-equalizing connection between the opposite sides of the impeller, and suction-balancing means.

6. In a centrifugal, turbine or similar pump, the combination with an inclosed impeller taking suction on one side of the impeller, of a pressure-equalizing connection between the opposite sides of the impeller, and a suction-balancing chamber on the back of the impeller communicating with the impeller-suction.

7. In a multistage centrifugal, turbine or similar pump, the combination with a plurality of inclosed impellers, of a pressure-equalizing connection between the opposite sides of each impeller, and suction-balancing means.

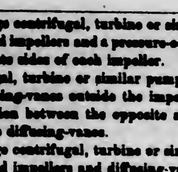
8. In a multistage centrifugal, turbine or similar pump, the combination with a plurality of inclosed impellers, of a pressure-equalizing connection between the opposite sides of each impeller, and a suction-balancing chamber on the back of each impeller communicating with the impeller-suction.

9. A centrifugal, turbine or similar pump having an inclosed liquid-impeller and a pressure-equalizing connection permitting the passage of liquid between the opposite sides of the impeller.

10. A multistage centrifugal, turbine or similar pump having a plurality of inclosed liquid-impellers, and a pressure-equalizing connection permitting the passage of liquid between the opposite sides of each impeller

11. A centrifugal, turbine or similar pump having an inclosed liquid-impeller taking suction on one side of the impeller, a pressure-equalizing connection permitting the passage of liquid between the opposite sides of the impeller, and a suction-balancing chamber on the back of the impeller communicating with the impeller-suction.

808,683. GOLF-BALL. FRANCIS H. RICHARDS, Hartford, Conn. Filed Apr. 11, 1903. Serial No. 152,268.



Claim.—1. A playing-ball comprising a filling, a shell and a locking device having an outwardly-extending portion.

2. A playing-ball comprising a filling, a plurality of shell-segments, and a locking device having an outwardly-extending portion adapted to be placed between the edges of the shell-segments.

3. A playing-ball comprising a filling, a shell, and a locking device having an outwardly-extending rib.

4. A playing-ball comprising a filling, a plurality of shell-segments, and a locking device having an extending rib.

5. In a playing-ball, a locking device consisting of a strip surrounding the core and having an outwardly-extending rib.

6. In a playing-ball, a locking device consisting of a flexible strip surrounding the core and having an outwardly-extending rib.

7. In a playing-ball, a locking device, consisting of a body portion surrounding a core and having a rib extending outwardly at right angles to the body portion.

8. In a playing-ball, a locking device consisting of a body portion having an outwardly-extending molded and patterned rib.

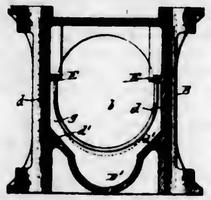
9. In a playing-ball, a locking device consisting of a body portion surrounding a core and having an outwardly-extending rib adapted to be placed between the abutting edges of the shell of the ball.

10. In a playing-ball, a locking device consisting of a body portion between the core of the ball and the joints of the shell, and a rib extending between the edges of the joints.

11. In a playing-ball, a locking device, consisting of a body portion between the filling of the ball and the joints of the shell, and integrally with the body portion a rib extending between the edges of the joint.

12. In a playing-ball, a locking device having a body portion adapted to fasten the joints of the shell to the filling, and a rib extending between the edges of the joint and adapted to unite the same.

808,684. CAR-AXLE BOX. WILLARD F. RICHARDS, Buffalo, N. Y., assignor to The Gould Coupler Company, New York, N. Y., a Corporation of West Virginia. Filed Apr. 14, 1900. Serial No. 13,883.



Claim.—1. A railway-car journal-box of standard type, provided with substantially upright side wall portions, a bottom forming an oil well or receptacle, and downwardly-converging side wall portions which join the bottom and upright portions of the side walls and are so disposed as to form spaces between the sides of the box and the journal which extend substantially the length of the box and decrease in width toward the oil-well, whereby the lubricating-packing is wedged between the journal and the converging portions of the walls of the box by the jarring of the latter, substantially as set forth.

2. A railway-car journal-box of standard type, having an integral bottom forming an oil well or receptacle, and integral side walls having substantially upright upper portions and downwardly-converging lower portions which join the bottom and are so disposed as to form spaces between themselves and the journal which extend substantially the length of the box and are narrower than the spaces between the journal and the upright upper portions of the side walls of the box, whereby the lubricating-packing is wedged between the journal and the converging portions of the walls of the box by the jarring of the latter, substantially as set forth.

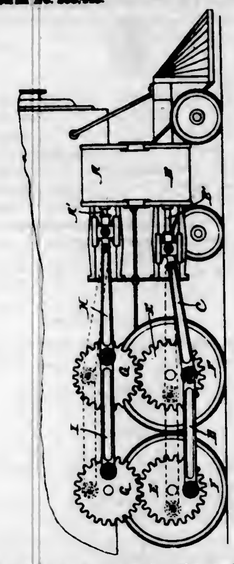
3. A railway-car journal-box of standard type, having an integral bottom forming an oil well or receptacle, and integral side walls having substantially upright upper portions and downwardly-converging lower portions which join the bottom and are so disposed as to form spaces between themselves and the journal which extend substantially the length of the box and are narrower than the spaces between the journal and the upright upper portions of the side walls of the box, and integral flanges projecting inwardly from the side walls of the box above said converging portions, substantially as set forth.

4. A journal-box provided in its front wall with a filling-opening, and in its rear wall with an opening for the passage of the journal, and having an inwardly-extending guard-flange arranged at the lower edge of said filling-opening, an internal semicircular guard-flange arranged at the lower and side edges of rear opening of the journal-box, and horizontal inwardly-extending flanges formed integral with the side walls of the box and arranged about on a level with the upper ends of said semicircular guard-flange, substantially as set forth.

5. The combination with a journal-box and a journal therein, of waste-supporting means at each side of the journal, said supporting means extending from the sides of the box downwardly and toward each other, the lower longitudinal edges of said supporting means being spaced apart and at least below the center of revolution of the journal and being the portions of said means nearest to the journal, and the uppermost portions of said supporting means being at a higher elevation than the bottom of the journal and lower than the axis of the journal.

6. A journal-box adapted to receive a horizontal journal, said box having waste-supporting means arranged at each side of the journal-receiving portion, said supporting means converging downwardly of the box and having such location that their lowermost portions will lie at least below the center of revolution of the journal and closest to the journal when the latter is in position, while their uppermost portions will lie farthest from and above the bottom of the journal and below the axis of the journal when the latter is in position.

808,685. LOCOMOTIVE-ENGINE. JOHN B. ROGERS, Oneida, Ky., assignor of one-half to B. Carnahan, Jr., Oneida, Ky. Filed Apr. 13, 1905. Serial No. 255,445.



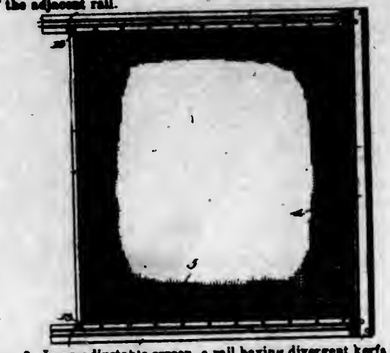
Claim.—1. In a locomotive-engine, the combination with the front and rear driving-wheels thereof, of two cylinders arranged upon each side of the locomotive, one above the other, a piston working in each cylinder, pitmen connected at their forward ends, one to each piston-rod, the rearward end of the lower pitmen being pivoted eccentrically to the forward driving-wheel, a connecting-rod connecting the forward driving-wheel with the rearward driving-wheel, gears secured to and adapted to revolve with the driving-wheels, gears arranged above the first-named gears and meshing with the same and journaled to the framework of the locomotive, the upper pitmen being pivoted eccentrically to the forward upper gears, connecting-rods connecting all of the upper gears together, the wrist-pins of the driving-wheels and the wrist-pins of the upper gears being so disposed relative to one another as to be one-quarter revolution removed relatively, as and for the purpose specified.

2. In a locomotive-engine, the combination with the front and rear driving-wheels thereof, of two cylinders arranged upon each side of the locomotive, said cylinders being arranged one above the other, piston-rods extending from said cylinders, two pitmen upon each side of the locomotive connected one to each piston-rod, the lower pitmen being connected at their rearward ends eccentrically to the forward driving-wheels, wheels arranged above the driving-wheels and adapted to mesh therewith, the upper pitmen connected at their rearward ends to the forward one of these wheels, connecting-rods connecting the driving-wheels together and also the wheels in mesh with the driving-wheel, the wrist-pins upon the driving-wheels being so disposed that the pistons in each pair of cylinders will always be at a distance apart equal to half of a complete stroke in either direction to cause the pistons at one side of the engine to move in the same direction for half of the stroke of any one piston, while during the next half-stroke the piston will move in opposite directions.

808,686. WINDOW-SCREEN FASTENING. BYRD C. ROCKWELL, Paris, Ark., assignor to Rockwell Manufacturing Co., a Corporation of Arkansas. Filed Apr. 27, 1904. Serial No. 205,145.

Claim.—1. In an adjustable screen, a pair of longitudinally-adjustable rails having oppositely-divergent kerfs, the kerfs of each rail terminating in a pair of slots extending through the rail and separated by a tongue, and a clip seated in said slots in engagement with the tongue and having divergent portions for engagement with the corresponding kerfs of the adjacent rail.

2. In an adjustable screen, a pair of longitudinally-adjustable rails having opposing faces adapted to contact with each other, said rails being provided with oppositely-diverging kerfs and with slots extending through the rails at the ends of said kerfs, in combination with clips bodily seated in said slots, secured against rocking movement, and provided each with divergent portions engaging the kerfs of the adjacent rail.



3. In an adjustable screen, a rail having divergent kerfs in the face thereof, an engaging rail having a clip-seat extending therethrough, and a clip engaging said seat, secured against rocking movement, and having divergent portions engaging the kerfs of the opposite rail.

4. In an adjustable screen, a pair of relatively movable screen-sections each comprising a frame and a sheet of reticulated material, and sheet-metal binding members for the inner edges of the reticulated material, said binding members having transverse incisions adjacent to their ends and the latter attached to the screen-frame, the body portions of the members between the incisions being angularly extended to lie in the path of each other to form stops and having their outer edges overriding the surface of the material of the adjacent screen-section

5. In a screen, a frame and a sheet of reticulated material carried thereby, a binding member for one edge of the material, longitudinal kerfs formed in a pair of the frame-bars and constituting seats for the adjacent edges of the material, said kerfs terminating in seats for the ends of the binding member, and means for securing the latter in place.

6. In an adjustable screen, a pair of relatively and longitudinally adjustable rails, one of said rails having a pair of divergent longitudinal kerfs and the other a longitudinal clip-seat extending through the body of the rail, a clip having a body portion engaging said seat and projecting divergent portions for engagement with the kerfs, and means for securing said clip against rocking movement.

7. In an adjustable screen, a pair of relatively and longitudinally adjustable rails, one of said rails having a pair of divergent longitudinal kerfs and the other a pair of slots producing an intermediate tongue, and a clip having a body portion engaging said tongue and divergent portions for engagement with the kerfs.

8. In an adjustable screen, a rail having a pair of divergent kerfs terminating in a clip-seat extending through the body of the rail, a clip having a body portion engaging the seat and divergent portions projecting beyond one face of the rail, and means for securing said clip against rocking movement.

808,687. CLOTHES-PIN. DAVID B. ROSENBOOM, Carey, Ill. Filed Nov. 23, 1904. Serial No. 234,074.

Claim.—A clothes-fastener comprising a wire which is bent at its longitudinal center forming a V-shaped shank portion, the opposite strands forming the longitudinal edges of which are slightly curved, the strands of wire at the flaring ends of said V-shaped portion being curved away from said V-shaped portion and having parallel portions which are spaced apart a short distance, theses twisted together, and flaring arms extending over the strands forming said V-shaped portion and the extreme ends of said arms laterally bent and turned into eyes, as set forth.

808,688. WAVE-MOTOR. CARL A. SAHLSTRÖM, Chicago, Ill. Filed Apr. 24, 1905. Serial No. 257,212.

Claim.—A surf-motor consisting of the combination with a pier

2. A multistage centrifugal, turbine or similar pump having a plurality of inclosed impellers and a pressure-equalizing connection between the opposite sides of each impeller.

3. A centrifugal, turbine or similar pump having an inclosed impeller and diffusing-vanes outside the impeller and a pressure-equalizing connection between the opposite sides of the impeller formed through the diffusing-vanes.

4. A multistage centrifugal, turbine or similar pump having a plurality of inclosed impellers and diffusing-vanes outside the impellers, and a pressure-equalizing connection between opposite sides of each impeller formed through the diffusing-vanes.

5. In a centrifugal, turbine or similar pump, the combination with an inclosed impeller taking suction on one side of the impeller, of a pressure-equalizing connection between the opposite sides of the impeller, and suction-balancing means.

6. In a centrifugal, turbine or similar pump, the combination with an inclosed impeller taking suction on one side of the impeller, of a pressure-equalizing connection between the opposite sides of the impeller, and a suction-balancing chamber on the back of the impeller communicating with the impeller-suction.

7. In a multistage centrifugal, turbine or similar pump, the combination with a plurality of inclosed impellers, of a pressure-equalizing connection between the opposite sides of each impeller, and suction-balancing means.

8. In a multistage centrifugal, turbine or similar pump, the combination with a plurality of inclosed impellers, of a pressure-equalizing connection between the opposite sides of each impeller, and a suction-balancing chamber on the back of each impeller communicating with the impeller-suction.

9. A centrifugal, turbine or similar pump having an inclosed liquid-impeller and a pressure-equalizing connection permitting the passage of liquid between the opposite sides of the impeller.

10. A multistage centrifugal, turbine or similar pump having a plurality of inclosed liquid-impellers, and a pressure-equalizing connection permitting the passage of liquid between the opposite sides of each impeller

11. A centrifugal, turbine or similar pump having an inclosed liquid-impeller taking suction on one side of the impeller, a pressure-equalizing connection permitting the passage of liquid between the opposite sides of the impeller, and a suction-balancing chamber on the back of the impeller communicating with the impeller-suction.

808,683. GOLF-BALL. FRANCIS H. RICHARDS, Hartford, Conn. Filed Apr. 11, 1903. Serial No. 152,268.

Claim.—1. A playing-ball comprising a filling, a shell and a locking device having an outwardly-extending portion.

2. A playing-ball comprising a filling, a plurality of shell-segments, and a locking device having an outwardly-extending portion adapted to be placed between the edges of the shell-segments.

3. A playing-ball comprising a filling, a shell, and a locking device having an outwardly-extending rib.

4. A playing-ball comprising a filling, a plurality of shell-segments, and a locking device having an extending rib.

5. In a playing-ball, a locking device consisting of a strip surrounding the core and having an outwardly-extending rib.

6. In a playing-ball, a locking device consisting of a flexible strip surrounding the core and having an outwardly-extending rib.

7. In a playing-ball, a locking device, consisting of a body portion surrounding a core and having a rib extending outwardly at right angles to the body portion.

8. In a playing-ball, a locking device consisting of a body portion having an outwardly-extending molded and patterned rib.

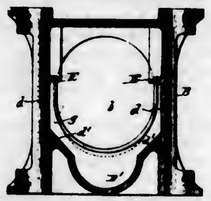
9. In a playing-ball, a locking device consisting of a body portion surrounding a core and having an outwardly-extending rib adapted to be placed between the abutting edges of the shell of the ball.

10. In a playing-ball, a locking device consisting of a body portion between the core of the ball and the joints of the shell, and a rib extending between the edges of the joints.

11. In a playing-ball, a locking device, consisting of a body portion between the filling of the ball and the joints of the shell, and integrally with the body portion a rib extending between the edges of the joint.

12. In a playing-ball, a locking device having a body portion adapted to fasten the joints of the shell to the filling, and a rib extending between the edges of the joint and adapted to unite the same.

808,684. CAR-AXLE BOX. WILLARD P. RICHARDS, Buffalo, N. Y., assignor to The Gould Coupler Company, New York, N. Y., a Corporation of West Virginia. Filed Apr. 14, 1900. Serial No. 13,883.



Claim.—1. A railway-car journal-box of standard type, provided with substantially upright side wall portions, a bottom forming an oil well or receptacle, and downwardly-converging side wall portions which join the bottom and upright portions of the side walls and are so disposed as to form spaces between the sides of the box and the journal which extend substantially the length of the box and decrease in width toward the oil-well, whereby the lubricating-packing is wedged between the journal and the converging portions of the walls of the box by the jarring of the latter, substantially as set forth.

2. A railway-car journal-box of standard type, having an integral bottom forming an oil well or receptacle, and integral side walls having substantially upright upper portions and downwardly-converging lower portions which join the bottom and are so disposed as to form spaces between themselves and the journal which extend substantially the length of the box and are narrower than the spaces between the journal and the upright upper portions of the side walls of the box, whereby the lubricating-packing is wedged between the journal and the converging portions of the walls of the box by the jarring of the latter, substantially as set forth.

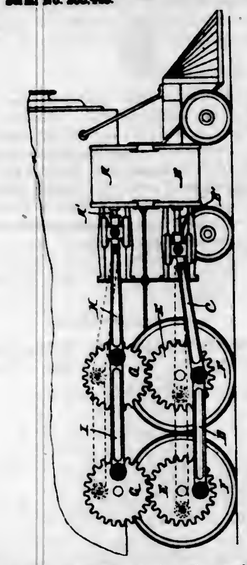
3. A railway-car journal-box of standard type, having an integral bottom forming an oil well or receptacle, and integral side walls having substantially upright upper portions and downwardly-converging lower portions which join the bottom and are so disposed as to form spaces between themselves and the journal which extend substantially the length of the box and are narrower than the spaces between the journal and the upright upper portions of the side walls of the box, and integral flanges projecting inwardly from the side walls of the box above said converging portions, substantially as set forth.

4. A journal-box provided in its front wall with a filling-opening, and in its rear wall with an opening for the passage of the journal, and having an inwardly-extending guard-flange arranged at the lower edge of said filling-opening, an internal semicircular guard-flange arranged at the lower and side edges of rear opening of the journal-box, and horizontal inwardly-extending flanges formed integral with the side walls of the box and arranged about on a level with the upper ends of said semicircular guard-flange, substantially as set forth.

5. The combination with a journal-box and a journal therein, of waste-supporting means at each side of the journal, said supporting means extending from the sides of the box downwardly and toward each other, the lower longitudinal edges of said supporting means being spaced apart and at least below the center of revolution of the journal and being the portions of said means nearest to the journal, and the uppermost portions of said supporting means being at a higher elevation than the bottom of the journal and lower than the axis of the journal.

6. A journal-box adapted to receive a horizontal journal, said box having waste-supporting means arranged at each side of the journal-receiving portion, said supporting means converging downwardly of the box and having such location that their lowermost portions will lie at least below the center of revolution of the journal and closest to the journal when the latter is in position, while their uppermost portions will lie farthest from and above the bottom of the journal and below the axis of the journal when the latter is in position.

808,685. LOCOMOTIVE-ENGINE. JOHN B. ROGERS, Oneida, Ky., assignor of one-half to R. Carnahan, Jr., Oneida, Ky. Filed Apr. 13, 1905. Serial No. 255,445.



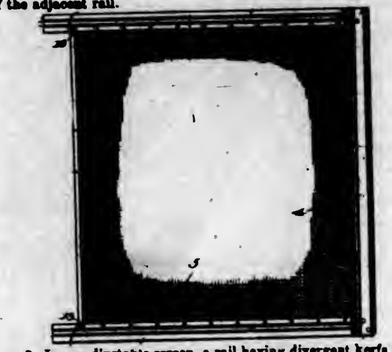
Claim.—1. In a locomotive-engine, the combination with the front and rear driving-wheels thereof, of two cylinders arranged upon each side of the locomotive, one above the other, a piston working in each cylinder, pitmen connected at their forward ends, one to each piston-rod, the rearward end of the lower pitmen being pivoted eccentrically to the forward driving-wheel, a connecting-rod connecting the forward driving-wheel with the rearward driving-wheel, gears secured to and adapted to revolve with the driving-wheels, gears arranged above the first-named gears and meshing with the same and journaled to the framework of the locomotive, the upper pitmen being pivoted eccentrically to the forward upper gears, connecting-rods connecting all of the upper gears together, the wrist-pins of the driving-wheels and the wrist-pins of the upper gears being so disposed relative to one another as to be one-quarter revolution removed relatively, as and for the purpose specified.

2. In a locomotive-engine, the combination with the front and rear driving-wheels thereof, of two cylinders upon each side of the locomotive, said cylinders being arranged one above the other, piston-rods extending from said cylinders, two pitmen upon each side of the locomotive connected one to each piston-rod, the lower pitmen being connected at their rearward ends eccentrically to the forward driving-wheels, wheels arranged above the driving-wheels and adapted to mesh therewith, the upper pitmen connected at their rearward ends to the forward one of these wheels, connecting-rods connecting the driving-wheels together and also the wheels in mesh with the driving-wheel, the wrist-pins upon the driving-wheels being so disposed that the pistons in each pair of cylinders will always be at a distance apart equal to half of a complete stroke in either direction to cause the pistons at one side of the engine to move in the same direction for half of the stroke of any one piston, while during the next half-stroke the piston will move in opposite directions.

808,686. WINDOW-SCREEN FASTENING. BYRD C. ROCKWELL, Paris, Ark., assignor to Rockwell Manufacturing Co., a Corporation of Arkansas. Filed Apr. 27, 1904. Serial No. 205,145.

Claim.—1. In an adjustable screen, a pair of longitudinally-adjustable rails having oppositely-divergent kerfs, the kerfs of each rail terminating in a pair of slots extending through the rail and separated by a tongue, and a clip seated in said slots in engagement with the tongue and having divergent portions for engagement with the corresponding kerfs of the adjacent rail.

2. In an adjustable screen, a pair of longitudinally-adjustable rails having opposing faces adapted to contact with each other, said rails being provided with oppositely-diverging kerfs and with slots extending through the rails at the ends of said kerfs, in combination with clips bodily seated in said slots, secured against rocking movement, and provided each with divergent portions engaging the kerfs of the adjacent rail.



3. In an adjustable screen, a rail having divergent kerfs in the face thereof, an engaging rail having a clip-seat extending therethrough, and a clip engaging said seat, secured against rocking movement, and having divergent portions engaging the kerfs of the opposite rail.

4. In an adjustable screen, a pair of relatively movable screen-sections each comprising a frame and a sheet of reticulated material, and sheet-metal binding members for the inner edges of the reticulated material, said binding members having transverse incisions adjacent to their ends and the latter attached to the screen-frame, the body portions of the members between the incisions being angularly extended to lie in the path of each other to form stops and having their outer edges overriding the surface of the material of the adjacent screen-section

5. In a screen, a frame and a sheet of reticulated material carried thereby, a binding member for one edge of the material, longitudinal kerfs formed in a pair of the frame-bars and constituting seats for the adjacent edges of the material, said kerfs terminating in seats for the ends of the binding member, and means for securing the latter in place.

6. In an adjustable screen, a pair of relatively and longitudinally adjustable rails, one of said rails having a pair of divergent longitudinal kerfs and the other a longitudinal clip-seat extending through the body of the rail, a clip having a body portion engaging said seat and projecting divergent portions for engagement with the kerfs, and means for securing said clip against rocking movement.

7. In an adjustable screen, a pair of relatively and longitudinally adjustable rails, one of said rails having a pair of divergent longitudinal kerfs and the other a pair of slots producing an intermediate tongue, and a clip having a body portion engaging said tongue and divergent portions for engagement with the kerfs.

8. In an adjustable screen, a rail having a pair of divergent kerfs terminating in a clip-seat extending through the body of the rail, a clip having a body portion engaging the seat and divergent portions projecting beyond one face of the rail, and means for securing said clip against rocking movement.

808,687. CLOTHES-PIN. DAVID R. ROBINSCOUR, Casey, Ill. Filed Nov. 23, 1904. Serial No. 234,874.

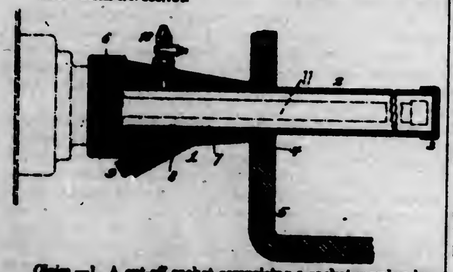
Claim.—A clothes-fastener comprising a wire which is bent at its longitudinal center forming a V-shaped shank portion, the opposite strands forming the longitudinal edges of which are slightly curved, the strands of wire at the flaring ends of said V-shaped portion being curved away from said V-shaped portion and having parallel portions which are spaced apart a short distance, thence twisted together, and flaring arms extending over the strands forming said V-shaped portion and the extreme ends of said arms laterally bent and turned into eyes, as set forth.

808,688. WAVE-MOTOR. CARL A. SAHLSTRÖM, Chicago, Ill. Filed Apr. 24, 1905. Serial No. 257,213.

Claim.—A surf-motor consisting of the combination with a pier

or like, support of arms or bars b pivoted to the pier, a buoyant paddle-wheel a mounted to rotate in said arms and to rise and fall with the tide, and means b to prevent back movement of the paddle-wheel.

808,689. CUT-OFF SOCKET. CLAY SADDLER, Plainfield, N. J., assignor to William B. Wadsworth, Plainfield, N. J. Filed May 18, 1905. Serial No. 260,791.



Claim.—1. A cut-off socket comprising a socket member having means for securing same to a tank, means for removably receiving a regulator therein, and means for controlling admission of fluid to the socket from the tank.

2. A cut-off socket having a portion adapted to enter a tank, and provided with means for securing it to the tank, said socket having means for controlling admission thereto of fluid from the tank, and adapted and arranged to removably support a thermostatic device.

3. A cut-off socket comprising a shell adapted to be secured to the wall of a tank, and a tube adapted to extend inward within the tank, said socket provided with means for controlling admission thereto of fluid from the tank, and adapted and arranged to removably support a temperature-regulator.

4. A cut-off socket comprising a shell adapted to be secured to the wall of a tank, and a tube adapted to extend therefrom inward within the tank, when in position therein, said shell having an internally-screw-threaded portion adapted for engagement with the correspondingly-screw-threaded portion of a temperature-regulator, said socket provided with means for controlling admission thereto of fluid from the tank.

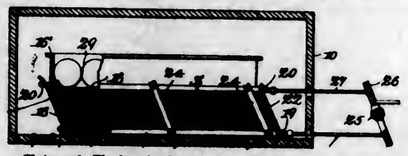
5. The combination with a tank and a thermostatic device controlling therein, of a cut-off socket surrounding the portion of the thermostatic device in the tank, said socket provided with means controlling admission of fluid thereto from the tank.

6. The combination with a tank, of a socket extending within same, and a thermostatic device removably fitted to said socket, said socket having means for controlling admission thereto of fluid from the tank.

808,690. DENTAL-SILK BOX. OTTO C. SCHULZ, Chicago, Ill., assignor to Bauer & Black, Chicago, Ill., a Corporation of Illinois. Filed Sept. 20, 1904. Serial No. 225,426.

Claim.—A dust-proof dental-silk pocket-package comprising a shallow cylindrical box consisting of two members, one member comprising the top of the box and a narrow peripheral flange thereon, and the other member comprising the bottom of the box and a similar flange thereon, said flanges being constructed to lap one over the other and lock together, one of said members being provided with a central opening, and a flat coil of thread or yarn held in place within said box between the top and bottom thereof, said coil being made to unwind from the center through the opening in the box, whereby the coil reduces in thickness but not in length or diameter and remains held in place between the top and bottom of the box until practically exhausted.

808,691. METHOD OF PLANISHING SHEETS OF METAL. AMMON RIDD, Newport, Ky. Filed Aug. 1, 1905. Serial No. 272,208.



Claim.—1. The herein-described method of treating sheet metal, said method consisting in causing sliding movement of oxid-coated sheets on one another, while the sheets are exposed to the action of heat.

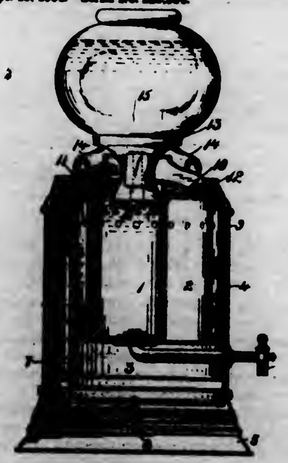
2. The herein-described method of simultaneously planishing and annealing oxid-coated sheet metal, said method consisting in sliding the sheets on each other while in an annealing-oven.

3. The herein-described method of simultaneously planishing and annealing sheet metal, said method consisting in causing sliding movement of oxid-coated sheets on each other while the sheets are held together, under pressure in an annealing-oven.

4. The herein-described method of planishing oxid-coated sheets, said method consisting in sliding the sheets one on the other while the sheets are held together by a mobile weight.

5. The herein-described method of planishing oxid-coated sheets, such method consisting in sliding the sheets one on the other while the sheets are held together by a mobile weight, and are exposed to the action of heat.

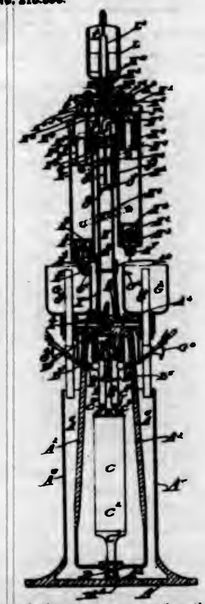
808,692. WATER-COOLER. GEORGE B. SAVAGE, Meriden, Conn. Filed Sept. 10, 1904. Serial No. 223,954.



Claim.—1. In a water-cooler, the combination of a main casing forming an ice-chamber 2, a water-tank 1 mounted therein, a double-walled cover 10 for said ice-chamber and said water-tank, supported by said water-tank and having a central opening, an auxiliary cover 11 supported by the main casing and having a passage for free communication of the air between said covers with the outer air, and means for supporting an inverted water-bottle with its neck within the opening in cover 10.

2. In a water-cooler, the combination of a main casing forming an ice-chamber 2, a water-tank 1 mounted therein, a cover extending over said ice-chamber and said water-tank but having a central opening, a frame supported by the casing and formed of rings 12 and 13, with arms 14 14, connecting the same, and an inverted water-bottle having a shoulder resting upon and vertically supported by said ring 13 and having its neck extending freely into the opening in said cover, but leaving a free communication with the outer air.

808,693. CALORIMETER. LOUIS SCHUTTE, Philadelphia, Pa., and ERNST KÖRTING, Pegli, Italy, assignors to Schutte and Korting Company, Philadelphia, Pa., a Corporation of Pennsylvania. Filed July 7, 1904. Serial No. 215,896.



Claim.—1. A calorimeter for measuring the heating value of gases having in combination a heater for water or other liquid and a gas-burner for heating the same, means for measuring the heat imparted to the liquid in the heater, means for feeding liquid through the heater, and means for forcing gas to the gas-burner, said means controlling the liquid and gas supply being so interconnected that the volumes of liquid and gas are delivered to the heater and burner in automatically-fixed proportion to each other.

2. A calorimeter for measuring the heating value of gases having in combination a heater for water or other liquid and a gas-burner for heating the same, means for measuring the heat imparted to the liquid in the heater, means for feeding liquid through the heater, means for forcing gas to the gas-burner, said means controlling the liquid and gas supply being so interconnected that the volumes of liquid and gas are delivered to the heater and burner in automatically-fixed proportion to each other, and means for adjusting the interconnected mechanism for supplying liquid and gas to vary the proportional relationship of the liquid and gas.

3. A calorimeter for measuring the heating value of gases having in combination a heater for water or other liquid and a gas-burner for heating the same, means for measuring the heat imparted to the liquid in the heater, means for feeding liquid through the heater, means for forcing gas to the gas-burner, said means controlling the liquid and gas supply being interconnected so that the volumes of liquid and gas are delivered to the heater and burner in automatically-fixed proportion to each other, and means for adjusting the interconnected mechanism for supplying liquid and gas to vary the proportionate supply of water without affecting the actual volume of gas supplied to the burner.

4. A calorimeter for measuring the heating value of gases having in combination a heater for water or other liquid, said heater having inlet and outlet ports and a gas-burner for heating the same, means for feeding liquid through the heater, means for forcing gas to the burner, said means controlling the liquid and gas supply being so interconnected that the volumes of liquid and gas are delivered in automatically-fixed proportion to each other, two thermostats, one connected to the inlet-port and the other to the outlet-port of the heater, and an indicator actuated by the relative movements of said thermostats for indicating the heat imparted to the liquid.

5. A calorimeter for measuring the heating value of gases having in combination a heater for water or other liquid, said heater having inlet and outlet ports and a gas-burner for heating the same, means for feeding liquid through the heater, means for forcing gas to the burner, said means controlling the liquid and gas supply being so interconnected that the volumes of liquid and gas are delivered in automatically-fixed proportion to each other, two thermostats, one connected to the inlet-port and the other to the outlet-port of the heater, an indicator actuated by the relative movements of said thermostats for indicating the heat imparted to the liquid, and two thermometers, one connected to the inlet and the other to the outlet of the heater for setting and verifying the thermostatic indicator.

6. A calorimeter for measuring the heating value of gases having in combination a heater for water or other liquid, said heater having inlet and outlet ports, and a gas-burner for heating the same, means for feeding liquid through the heater, means for forcing gas to the burner, said means controlling the liquid and gas supply being so interconnected that the volumes of liquid and gas are delivered in automatically-fixed proportion to each other, two thermostats, one connected to the inlet-port and the other to the outlet-port of the heater, a rocking arm E^{10} actuated by the thermostats as described and an indicator actuated by the rocking arm E^{10}, and having an adjustable pivot.

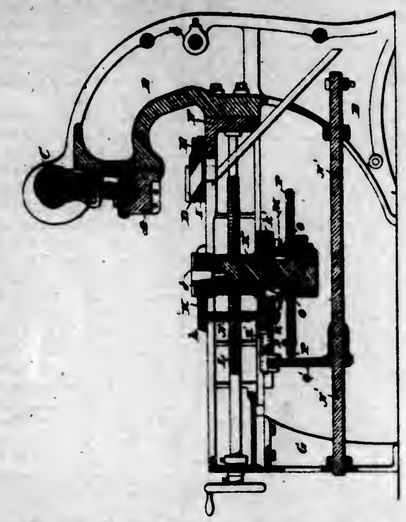
7. In a calorimeter for measuring the heating value of gases, a heater C, having two sets of gas and water conduits the one set placed above the other and the gas-conduits in both sets connected in series, a water-inlet conduit leading to the bottom of the upper set, a conduit leading from the top of the upper to the bottom of the lower set and an outlet-conduit leading from the top of the lower set, a gas-burner situated below the lower set of conduits, means for feeding water through the heater and forcing gas to the burner in automatically-regulated proportionate volumes, and means connected with the inlet and outlet conduits of the heater for measuring the heat imparted to the water.

8. In a calorimeter for ascertaining the heating value of gases, and having a heater for water or other liquid, a gas-burner for heating the same and means for measuring the heat imparted to the water, the combination of the vessels N, N', and means for supporting said vessels so that one moves up as the other moves down, a latch for securing said vessels in their extreme up-and-down positions valves in the bottoms of vessels N, and N', for permitting the outflow of water therefrom into receptacles connected with the heater, means for automatically opening said valves when the vessel is in its lower position, water and gas supply conduits leading into each vessel, means whereby water is supplied therethrough to the vessels when in their upper positions, and means actuated by the filling of the vessels with water for releasing the latch holding the vessels in fixed position and permitting their positions to shift by gravity.

9. In a calorimeter for ascertaining the heating value of gases, and having a heater for water or other liquid, a gas-burner for heating the same and means for measuring the heat imparted to the water, the combination of the vessels N, N', and means for supporting said vessels so that one moves up as the other moves down, a latch for securing said vessels in their extreme up-and-down positions, valves in the bottoms of vessels N, and N', for permitting the outflow of water therefrom, into receptacles connected with the heater, means for automatically opening said valves when the vessel is in its lower position, water and gas supply conduits leading into each vessel, means whereby water is supplied therethrough to the vessels when in their upper positions, means whereby gas is supplied to the vessels in their lower positions and exhausted therefrom to the burner in their upper positions, means actuated by the filling of the vessels with water for releasing the latch holding the vessels in fixed position and permitting their positions to shift by gravity, receptacles

arranged to receive the water from vessels N, N', said receptacles being connected to the heater, means whereby said receptacles are alternately connected to supply the heater and adjustable waste-conduits leading from each said receptacles whereby the volume of water supplied to the heater can be reduced in any desired proportion.

808,694. PRESS. CORNELIS SMITS, Bridgeton, N. J. Filed Oct. 24, 1903. Serial No. 178,622.



Claim.—1. The combination of a work-holder, a punch, a die-holder, a bed supporting both work-holder and die-holder, and means for adjusting the die-holder and work-holder relatively to each other in a direction transverse to the line of movement of the punch.

2. The combination of a rotatable work-holder, comprising means for supporting the work, a shaft that is rigid with said means, a gear-wheel on said shaft, a second shaft to which power is applied, and a removable pinion on said second shaft and meshing with the gear-wheel.

3. The combination of a rotatable work-holder comprising means for supporting the work, a shaft rigid with said means, a gear-wheel on the shaft, a shaft that is intermittently actuated and a removable pinion on said shaft meshing with the gear-wheel.

4. The combination of a rotatable work-holder comprising means for supporting the work, a shaft rigid with said means, a gear-wheel on the shaft, a shaft having a ratchet-wheel, a pinion on said shaft, said ratchet-wheel and pinion being removable from the shaft, and a suitably-operated pawl for operating the ratchet-wheel.

5. The combination of a rotatable work-holder comprising means for supporting the work, a shaft, a gear-wheel on the shaft, a shaft for imparting motion to said gear-wheel, having a removable wheel, and a screw-ring having interrupted thread, for securing said wheel to its shaft.

6. The combination of a rotatable work-holder, means for revolving the same comprising a pawl and ratchet-wheel, a brake, and means to disengage the pawl and ratchet-wheel and to release the brake.

7. The combination of a rotatable work-holder, means for revolving the same comprising a pawl and ratchet-wheel, a brake and means to simultaneously disengage the pawl from the ratchet-wheel and release the brake.

8. The combination of a rotatable work-holder comprising means for supporting the work, a shaft, a gear-wheel on said shaft, a friction-brake to act on the gear-wheel, pawl-and-ratchet mechanism for revolving said gear-wheel and means to release the brake and to disengage the pawl.

9. The combination of a rotatable work-holder comprising means for supporting the work, a shaft, a gear-wheel on the shaft, a driving-shaft, mechanism for transmitting motion from the latter to said gear-wheel, a treadle-shaft for connecting the driving-shaft to the source of power, an arm on the treadle-shaft, a latch for said arm and a part carried by the gear-wheel to operate the latch.

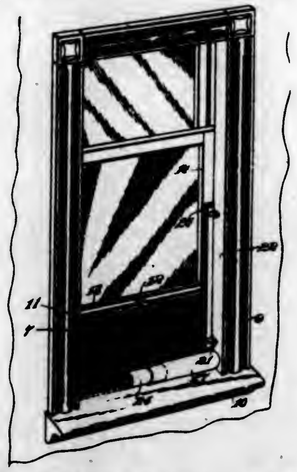
10. The combination of a rotatable work-holder, means for rotating said work-holder comprising a gear-wheel and a pawl-and-ratchet mechanism, a friction-brake for the gear-wheel, a driving-shaft, a treadle-shaft for connecting the latter with a source of power, an arm on the treadle-shaft, a latch for said arm, a part carried by the gear-wheel to actuate the latch, and arms on the treadle-shaft to release the friction-brake and disengage the pawl of the pawl-and-ratchet mechanism.

11. The combination of punching mechanism, a rotatable work-holder, pawl-and-ratchet mechanism for rotating the work-holder, a pawl-operating device and an adjustable connection between the pawl and said device whereby the position of the work-holder relative to the punching mechanism may be adjusted.

12. The combination of punching mechanism, a rotatable work-holder, a pawl-and-ratchet mechanism for operating the work-holder, a pawl-operating device, and an eccentric connection between the pawl and said device.

13. The combination of a rotatable work-holder comprising means for supporting the work a shaft, a saddle for supporting the work-holder, cone-bearings for the shaft in the saddle, a bed and means for clamping the saddle to the bed.

808,695. WINDOW-SCREEN. SIDNEY F. SMITH, Freeport, and STEPHEN S. SWEET, New York, N. Y. Filed Oct. 10, 1904. Serial No. 227,780.



Claim.—The combination with a window embodying casing and sill, of a sash movable therein, fixture members each struck up from a single sheet-metal blank and one of these secured to each side of the casing by means of integral lugs and having a portion adjacent to the sill affording a bearing for a roller and a portion affording a guard at the end of the roller and a portion affording a guideway and protector for the screen-shade, a roller mounted in said bearing, a screen-shade upon such roller and traversing such guide and protector, and means for securing the end of such shade to the sash, and a guard surrounding the roller to protect the roll of the screen-shade thereon, such guard embodying telescopic body portions having a hook at its top and having a portion adapted to rest upon the sill, and hook portions upon the fixture members for engaging said hook upon the guard.

808,696. ADDING-MACHINE. WILLIAM F. SMITH, Jackson, Miss., assignor of one-half to Arthur Cecil Jones, Jackson, Miss. Filed Nov. 14, 1903. Serial No. 181,207.

Claim.—1. In an adding-machine, the combination with a carriage, a platen mounted thereon and type-bars with numerals thereon coacting with said platen, of arms pivotally mounted in said carriage, a plurality of totaling-wheels carried by said arms and adapted to be swung by said arms against said platen, and means for operating said type-bars and said totaling-wheels simultaneously, substantially as shown and described.

2. In an adding-machine, the combination with a carriage, a platen mounted thereon, and type-bars with numerals thereon coacting with said platen, of arms pivotally mounted in said carriage, a handle extending upward from one of said arms, a shaft carried by the free ends of said arms, a plurality of totaling-wheels mounted on said shaft and adapted to be swung by said arms against said platen, and means for operating said type-bars and said totaling-wheels simultaneously, substantially as shown and described.

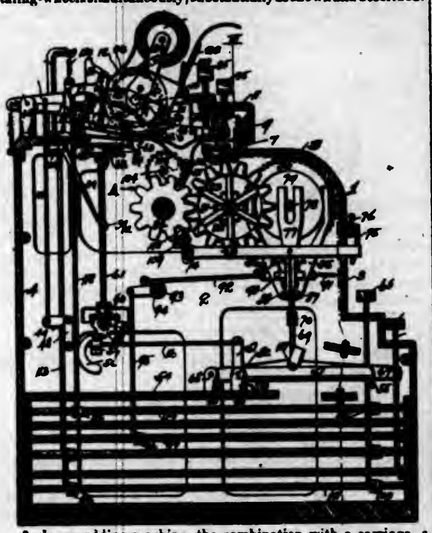
3. In an adding-machine, the combination with a carriage, a platen mounted thereon, and type-bars with numerals thereon coacting with said platen, of arms pivotally mounted in said carriage, a handle extending upward from one of said arms, a shaft carried by the free ends of said arms, a plurality of totaling-wheels mounted on said shaft and adapted to be swung by said arms against said platen, and means for operating said type-bars and said totaling-wheels simultaneously, substantially as shown and described.

4. In an adding-machine, the combination with a carriage, a platen mounted thereon and type-bars with numerals thereon coacting with said platen, of arms pivotally mounted in said carriage, a plurality of totaling-wheels carried by said arms and adapted to be swung by said arms against said platen, number-keys operating said type-bars, and gears connecting said number-keys and said totaling-wheels, substantially as shown and described.

5. In an adding-machine, the combination with a carriage, a platen mounted thereon, and type-bars with numerals thereon coacting with said platen, of arms pivotally mounted in said carriage, a plurality of totaling-wheels carried by said arms and adapted to be swung by said arms against said platen, a master-gear engaging each of said totaling-wheels successively as said carriage moves, and number-keys operating said type-bars and said master-gear, substantially as shown and described.

6. In an adding-machine, the combination with a carriage, a platen mounted thereon, and type-bars with numerals thereon coacting with said platen, of arms pivotally mounted in said carriage, a plurality of totaling-wheels carried by said arms and adapted to be swung by said arms against said platen, a master-gear engaging each of said totaling-wheels successively as said carriage moves, number-keys operating said type-bars, and means operated by said keys for rotating said master-gear a predetermined amount and means for reversing the direction of rotation.

7. In an adding-machine, the combination with a carriage, a platen mounted thereon, and type-bars with numerals thereon coacting with said platen, of arms pivotally mounted in said carriage, a plurality of totaling-wheels carried by said arms and adapted to be swung by said arms against said platen, a master-gear engaging each of said totaling-wheels successively as said carriage moves, a shaft carrying said master-gear, a pinion on said shaft, a gear meshing with said pinion a shaft carrying said gear, a ratchet-wheel on said second shaft, oppositely-disposed racks, means for engaging either of said racks with, and for disengaging the other from said ratchet-wheel, number-keys operating said type-bars, and means operated by said number-keys for depressing said racks to operate said master-gear, substantially as described.



8. In an adding-machine, the combination with a carriage, a platen mounted on said carriage, arms pivoted to said carriage and a plurality of totaling-wheels carried by said arms, and a handle extending upward from one of said arms to swing same and bring said totaling-wheels against said platen.

9. In an adding-machine, the combination with a carriage, a platen mounted on said carriage, arms pivoted to said carriage, a plurality of totaling-wheels carried by said arms, and a handle extending upward from one of said arms to swing same and bring said totaling-wheels against said platen, of a master-gear mounted in a fixed frame and meshing directly with each of said totaling-wheels in succession as the carriage moves, substantially as described.

10. In an adding-machine, the combination with totaling-wheels carried in a movable frame, a master-wheel in mesh with said wheels, mounted on a shaft, a pinion fastened to said shaft, a driving-gear meshing with said pinion a shaft carrying said driving-gear, a pin-gear carried on said shaft, a rack engaging said gear and means of operating said rack.

11. In an adding-machine, the combination with totaling-wheels carried in a movable frame, a master-wheel in mesh with said wheels, mounted on a shaft in a fixed frame, a pinion fastened to said shaft, a driving-gear meshing with said pinion, a shaft carrying said driving-gear, a pin-gear carried on said shaft, a rack engaging said gear, a second rack and means of disengaging one rack and simultaneously engaging the other with the opposite face of said gear and means of depressing said racks a predetermined amount.

12. In an adding-machine, the combination with a set of totaling-wheels, a master-gear engaging said wheels successively, a shaft carrying said master-gear, a pinion mounted on said shaft, a driving-gear meshing with said pinion, a shaft carrying said driving-gear, a pin-wheel, a rack engaging said pin-wheel, a cross-arm pivoted at one end, a link depending from said rack and attached to said cross-arm near its center, a plurality of number-keys and levers operated thereby, arranged in numerical order and links connecting said levers with said cross-arm at proportionate distances from said pivoted end, whereby said rack is depressed proportionate amounts when said number-keys are depressed.

13. In an adding-machine, the combination with a plurality of totaling-wheels, of a master-gear engaging successively each of said totaling-wheels, means of moving said totaling-wheels to bring each successively into engagement with said master-wheel, a train of gearing actuating said master-gear, racks one of which is normally in engagement with said gearing and means of disengaging one rack and engaging the other to reverse the direction of motion.

14. In an adding-machine, the combination with totaling-wheels carried in a movable frame, a master-gear in mesh with said wheels and means of advancing said wheels to bring each successively into mesh with said master-wheel, of a ratchet-wheel, and gearing connecting said wheel with said master-wheel, oppositely-disposed racks and means of engaging either of said racks with said ratchet-wheel and of simultaneously disengaging the other of said racks, substantially as shown and described.

15. In an adding-machine, the combination with totaling-wheels carried in a movable frame, a master-gear in mesh with said wheels mounted in a fixed frame and means of advancing said totaling-wheels to bring each successively into mesh with said master-gear, gearing actuating said master-gear, racks, one of which normally engages said gearing and means of disengaging same and simultaneously engaging the other of said racks to reverse the direction of motion.

16. In an adding-machine, the combination with totaling-wheels carried in a movable frame, a master-gear in mesh with said wheels mounted on a shaft in a fixed frame, a pinion fastened to said shaft, a driving-gear meshing with said pinion, a shaft carrying said driving-gear, a pin-gear carried on said shaft, a forked link guided by said pin-gear shaft, a rack engaging said gear and carried by said link an oppositely-disposed rack carried by said link, a shift-key and a connection between said shift-key and said link.

17. In an adding-machine, the combination with totaling-wheels carried in a movable frame, a master-gear in mesh with said wheels mounted on a shaft in a fixed frame, a pinion fastened to said shaft, a driving-gear meshing with said pinion, a shaft carrying said driving-gear, a pin-gear carried on said shaft, a forked link guided by said pin-gear shaft, a rack engaging said gear and carried by said link an oppositely-disposed rack carried by said link, a tension-spring connecting said racks, a space-bar, a shift-key, and levers and links connecting said shift-key and said space-bar with said racks.

18. In an adding-machine, the combination with totaling-

wheels carried in a movable frame, a master-gear in mesh with said wheels mounted on a shaft in a fixed frame, a pinion fastened to said shaft, a driving-gear meshing with said pinion, a shaft carrying said driving-gear, a pin-gear carried on said shaft, a rack engaging said gear, a link connecting said rack with a cross-arm, a plurality of number-keys, a lever for each key and a link connecting each of said levers with said cross-arm.

19. In an adding-machine, the combination with a frame, number-keys mounted in said frame, key-rods extending downward therefrom, levers engaged by said rods, a U-shaped piece beneath said levers, a bell-crank lever on said U-piece, a second bell-crank lever a link connecting said bell-crank levers, a step-by-step mechanism, a link connecting said step-by-step mechanism to said bell-crank levers, a set of totaling-wheels and means of operating said wheels from said levers, of a set of type-bars mounted in said frame and a set of levers and rods connecting each of said bars with one of said key-rods.

20. In an adding-machine, the combination with a frame, number-keys mounted in said frame, key-rods extending downward therefrom, levers engaged by said rods, a U-shaped piece beneath said levers, a bell-crank lever on said U-piece, a second bell-crank lever, a link connecting said bell-crank levers, a ratchet-pawl on said link, a shaft mounted in said frame, a ratchet-wheel mounted on said shaft and engaged by said pawl, a pinion on said shaft, a crown-wheel in engagement therewith, a shaft extending upward therefrom, a ribbon-reel on said shaft, a step-by-step mechanism a link connecting said step-by-step mechanism and said bell-crank levers, a set of totaling-wheels, and means of operating said wheels from said levers, of a set of type-bars mounted in said frame and a set of levers and rods connecting each of said bars with one of said key-rods.

21. In an adding-machine, the combination with a frame, number-keys mounted in said frame, key-rods extending downward therefrom, levers engaged by said key-rods, a set of totaling-wheels, links and gearing connecting said wheels and said levers, bell-crank levers on opposite sides of said frame, a bar beneath said key-levers connecting said bell-crank levers, a second bell-crank lever, a link connecting said bell-crank levers, a pawl on said link, a ratchet-wheel engaged by said pawl, ribbon-spools and means operated by said ratchet of operating said spools, of a set of type-bars mounted in said frame and a set of levers and rods connecting each of said bars with one of said key-rods.

22. In an adding-machine, the combination with a frame, number-keys mounted in said frame, key-rods extending downward therefrom, levers engaged by said key-rods, a set of totaling-wheels, and means of operating said wheels from said levers, a carriage on said frame, a platen mounted on said carriage, bell-crank levers pivoted to said carriage, a cross-bar connecting the ends of said bell-crank levers and links extending from said bell-crank levers and embracing the ends of said platen, of a set of type-bars mounted in said frame, a set of levers and rods connecting each of said bars with one of said key-rods and means operated by said key-levers of depressing the end of said bell-crank levers to shift the platen.

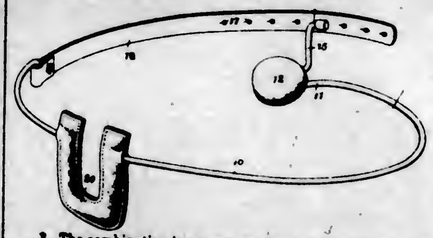
23. In an adding-machine, the combination with a frame, number-keys mounted in said frame, key-rods extending downward therefrom, levers engaged by said key-rods, a cross-bar above said levers and pivoted in said frame, a link extending upward from each of said levers and engaging said bar, a set of totaling-wheels, a master-gear meshing with said wheels, gearing driving said master-wheel, oppositely-disposed racks, one normally engaging said gearing and a link connecting said racks and said cross-levers, of a set of type-bars mounted in said frame and a set of levers and rods connecting each of said bars with one of said key-rods.

24. In combination in a calculating-machine, a series of number-wheels, a carrier therefor, a series of order-keys arranged on the carrier, means controlled by the operation of the order-keys for shifting the carrier, a stop to be struck by the operated order-key to arrest the carrier with the appropriate number-wheel in proper position to be turned, digit-keys and connections therefrom to the number-wheels for turning the same.

808,697. TRUSS. MARCUS B. SEVIER, Halton, Kans. Filed Aug. 14, 1905. Serial No. 274,189.

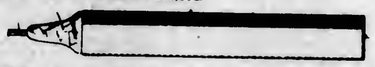
Claim.—1. The combination in a truss, of a brace, the forward end of which is bent to form a pad-supporting bar in parallel relation with the front of the brace, and thence is bent upward to form waist-strap connection distant from the forward end of the brace.

2. The combination in a truss, of a brace member arranged to extend around one side and a portion of the rear of the body, the front of the brace being bent into parallel relation with itself to form a pair of pad-supporting members, and being thence bent upward and provided with a strap connection at a point above the pad-support, and distant from the forward end of the brace.



3. The combination in a truss, of a brace formed of spring-wire designed to encircle one side and a portion of the rear of the body, the rear of said brace being bent to form an open loop, the side members of which are disconnected or spaced in the plane of the brace proper and are free to spread and yield to the movements of the body, and a covering extending over said loop.

808,698. CANDLE. CHARLES A. SPIES, Menominee, Mich. Filed May 22, 1905. Serial No. 261,554.



Claim.—1. A candle enveloped in a non-inflammable sheath destructible by the flame of the candle and extending from the base portion to a point higher than would be necessary to retain the melted candle-stock when the candle is entirely melted by the consumption of the stock.

2. A candle enveloped in a non-inflammable sheath destructible by the flame of the candle at a lower rate of speed than that at which the candle is consumed in burning, the sheath being constructed to envelop substantially the whole of the body portion of the candle.

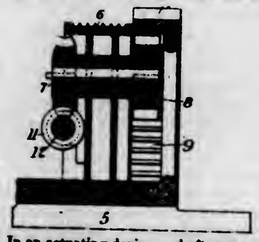
3. A candle enveloped in a non-inflammable sheath, destructible by the flame of the candle at a lower rate of speed than that at which the candle is consumed when burning, the said sheath extending from the base of the tip to the butt of the candle.

4. A candle having a sheath of inorganic material, destructible by the flame of the candle, and extending from the base of the tip to the butt of the candle.

5. A candle enveloped in a non-inflammable vaporizable sheath, destructible by the flame of the candle, and extending from the base of the tip to the butt of the candle.

6. A candle enveloped in a sheath of metal having a low fusing-point and destructible by the flame of the candle, and extending from the base of the tip to the butt.

808,699. ADJUSTING MECHANISM FOR ROPE-DRIVES. RICHARD H. STEVENS, Mumball, Pa. Filed June 19, 1905. Serial No.



Claim.—1. In an actuating device, a shaft, a gear-wheel thereon, a drum loose on the shaft, and an adjustable locking means pivoted eccentric to said shaft securing the drum to the gear-wheel; substantially as described.

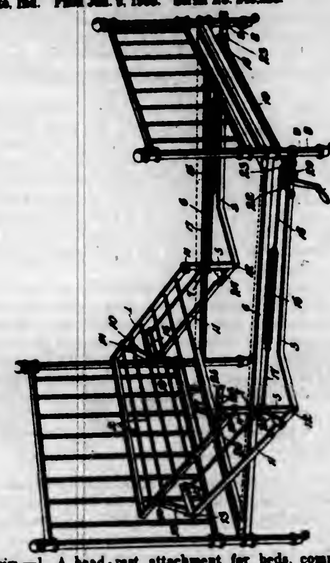
2. In a rope-actuating device, a shaft, a gear-wheel thereon, an internal gear on the shaft, a drum loose on the shaft, and a worm-gear device mounted on the drum and having a gear-wheel engaging with the internal gear on the shaft; substantially as described.

3. In rope-actuating mechanism, a shaft, a drum, and a gear-wheel mounted thereon, one of said parts being loose on the shaft while the other part is secured thereto, and an adjustable lock between the two elements pivoted eccentric to said shaft and arranged to shift one of said parts angularly relative to the other part; substantially as described.

4. In rope-driving mechanism, a shaft, a drum and internal gear-wheel mounted thereon, at least one of said parts being loose on the shaft, and a worm-gear mechanism mounted on the drum and having a gear-wheel engaging with the internal gear; substantially as described.

5. In rope-driving mechanism, a shaft, a gear-wheel and a drum mounted thereon, one of said parts being loosely mounted on the shaft, and the other secured thereto, an internal gear on one of said parts and a worm-gear on the other part having a pinion engaging the internal gear; substantially as described.

808,700. HEAD-REST FOR BEDS. JASPER D. SHOCK, Terre Haute, Ind. Filed Jan. 9, 1905. Serial No. 240,226.



Claim.—1. A head-rest attachment for beds, comprising a hinged head-rest, a lever arranged in parallelism with the head-rest and connected with the same, and yieldable means connected with the lever for supporting the head-rest in an inclined position.

2. A head-rest attachment for beds, comprising a hinged head-rest, a lever spaced throughout the entire length from the head-rest and connected therewith and provided with an arm, and yieldable means connected with the arm for supporting the head-rest.

3. A head-rest attachment for beds, comprising a hinged head-rest, a lever arranged in spaced relation therewith and provided with an angularly-disposed arm extending upwardly from the lever, a link connecting the lever with the head-rest, and yieldable means connected with the arm of the lever for supporting the head-rest

4. A head-rest attachment for beds, comprising a hinged head-rest, a lever located beneath and arranged in spaced relation with the head-rest and provided at one end with an arm, a guide connected with the lever and located near the other end of the same, means for connecting the lever with the head-rest, and a yieldable device having a flexible connection passing through the guide and attached to the arm of the lever.

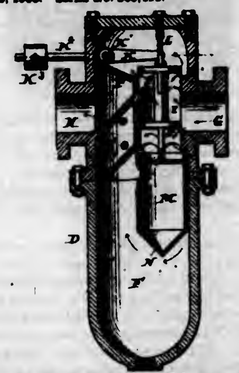
5. A head-rest attachment for beds, comprising a support, a hinged head-rest mounted on the support, a lever fulcrumed on the support and arranged in spaced relation with the head-rest and provided at its outer end with an arm, a link connecting the outer end of the lever with the head-rest, a guide extending upwardly from the inner portion of the lever, a flexible connection attached to the arm of the lever and passing through the guide, a spring connected with the said flexible connection, and a tension device.

6. A head-rest attachment for beds, comprising a support having an upwardly-extending arm, a head-rest hinged to the arm between the ends thereof, and a locking-bar pivoted to the head-rest and provided at intervals with means for engaging the arm.

7. A head-rest attachment for beds, comprising supports, consisting of longitudinal bars having upwardly-extending arms, means for securing the supports to a bed, a hinged head-rest mounted on the arms of the support, operating-levers arranged in spaced relation with the head-rest and located beneath the same, means for connecting the levers with the head-rest, springs, flexible connections extending from the springs to the levers and a tension device mounted on the support and connected with the springs.

8. A head-rest attachment for beds, comprising a head-rest hinged at one end, a lever arranged in spaced relation with the head-rest and pivoted at one end beneath the hinged end of the said head-rest, a link located at the other end of the lever and connecting the same with the head-rest, and means connected with the lever for supporting the head-rest.

808,701. STEAM-SEPARATOR AND AUTOMATIC SHUT-OFF. DANIEL H. STREBEIGH and JOHN W. OELSCHLAGER, Norristown, Pa. Filed July 6, 1905. Serial No. 268,416.



Claim.—1. In an automatic shut-off for controlling the supply of steam and water, the combination of a steam-passage, a normally open valve to control the said passage, and means operated by the mass of water passing through the inlet side of the valve for automatically closing the valve when said water is in excess.

2. In an automatic shut-off for controlling the supply of steam and water, the combination of a steam-passage, a normally open valve to control said passage, and means operated by the mass of water passing through the inlet side of the valve for automatically closing the valve when said water is in excess consisting of a bucket connected to and arranged below the valve to receive the water passing through the valve.

3. In an automatic shut-off for controlling the supply of steam and water, the combination of a steam-passage, a normally open valve to control said passage, means operated by the mass of water passing through the inlet side of the valve for automatically closing the valve when said water is in excess consisting of a bucket connected to and arranged below the valve to receive the water passing through the valve and having a drainage-aperture for permitting the water collected in the bucket to gradually escape therefrom, and means to open the valve when the water is sufficiently drained from the bucket.

4. In an automatic shut-off for controlling the supply of steam, the combination of a steam-passage, a valve to control said steam-passage, a counterweight for normally holding the valve in an open position, and means operating by an accumulation of water on the inlet side of the valve for automatically closing the valve.

5. In an automatic shut-off for controlling the supply of steam, the combination of a steam-passage containing baffle-plates to separate the water from the steam, a valve to control said steam-passage, a counterweight for normally holding the valve in an open position, and means operating by an accumulation of water on the inlet side of the valve for automatically closing the valve.

6. In an automatic shut-off for controlling the supply of steam, the combination of a steam-passage, a valve to control said steam-passage, a counterweight for normally holding the valve in an open position, means operating by an accumulation of water on the inlet side of the valve for automatically closing the valve, and means for draining and removing the excessive water accumulations from the steam-passage whereby they are gradually removed.

7. The combination with the engine and steam-pipes B and E, of the automatic water-shut-off device D of the character described, the drain-pipe R from the bottom of the said automatic shut-off device, and a steam-trap S connected to said drain-pipe.

8. In an automatic shut-off for controlling the supply of steam and water, the combination of a steam-passage, a normally open balanced valve to control the said passage and means operated by the mass of water passing through the inlet side of the valve for automatically closing the valve when said water is in excess.

808,702. ATTACHMENT FOR WASHTUBS. MILTON W. STORY, Indianapolis, Ind., assignor of one-half to Emma De Witt, Indianapolis, Ind. Filed Feb. 25, 1905. Serial No. 247,236.

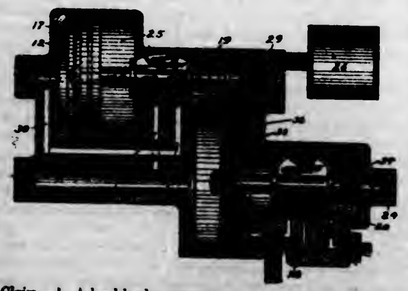
Claim.—1. A device of the kind described comprising parallel curved wire members, means for attaching said members to a tub, and adjustable blocks movable along said members.

2. A device of the kind described comprising a curved wire member having hook members formed at its ends and adapted to engage the upper edge of a tub, and adjustable blocks carried by said wire member.

3. A device of the kind described comprising parallel wire members, vertical hook members carried by one of the wire members and adapted to engage the upper edge of a tub, and blocks carried by the wire members, said blocks being cut away on their inner faces adjacent their upper ends, as and for the purpose set forth.

4. A device of the kind described comprising a wire member curved and having hooks formed at each end, a second wire member having its end portions bent upwardly and in engagement with the first mentioned wire member, and blocks adjustably carried by said wire members, said blocks being cut away on their inner faces, as and for the purpose set forth.

808,703. LOAD-BRAKE APPARATUS. WALTER V. TURNER, Wilkinsburg, Pa., assignor to Westinghouse Air Brake Company, Wilmerding, Pa., a Corporation of Pennsylvania. Filed Apr. 1, 1904. Serial No. 201,167.



Claim.—1. A load brake apparatus comprising in combination with a train pipe, auxiliary reservoir, cylinder, and triple valve, a valve mechanism having a casing provided with connections leading from the triple valve to the cylinder and a connection to the train pi;e, a valve controlling said connections from the triple to the cylinder to cut off the flow of pressure on a light car, a movable abutment for actuating said controlling or throttling valve, said abutment being actuated by differential pressures on its opposite sides the one side being exposed to the pressure in the brake cylinder, substantially as described.

2. A load brake apparatus comprising in combination with a train pipe, auxiliary reservoir, cylinder, and triple valve, a valve mechanism having a casing provided with connections leading from the triple valve to the cylinder and a connection to the train pipe, a valve controlling said connections from the triple to the cylinder to cut off the flow of pressure on a light car, a movable abutment for actuating said controlling or throttling valve, said abutment being actuated by differential pressures on its opposite sides the one side being exposed to the pressure in the brake cylinder, substantially as described.

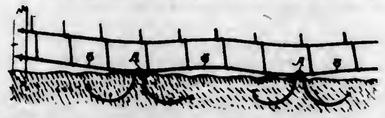
3. A load brake apparatus comprising in combination with a train pipe, auxiliary reservoir, cylinder, and triple valve, a valve mechanism having a casing provided with connections leading from the triple valve to the cylinder and a connection to the train pipe, a valve controlling said connections from the triple to the cylinder to cut off the flow of pressure on a light car, a movable abutment for actuating said controlling or throttling valve, said abutment being actuated by differential pressures on its opposite sides the one side being exposed to the pressure in the brake cylinder, and means for reducing the excess of pressure in the auxiliary reservoir when the load brake is in operation for light car service, whereby to secure prompt release of the brakes, substantially as described.

4. A load brake mechanism for automatic air brakes comprising in combination, means for throttling the flow of air from the triple to the brake cylinder, and mechanism whereby to reduce the excess of pressure remaining in the auxiliary reservoir when the flow from the triple to the cylinder is thus throttled, so as to secure prompt release of the brakes, substahtially as described.

5. A load brake apparatus comprising in combination with a train pipe, auxiliary reservoir, cylinder, and triple valve, a valve mechanism having a casing provided with connections leading from the triple valve to the cylinder and a connection to the train pipe, a valve controlling said connections from the triple to the cylinder to cut off the flow of pressure on a light car, a movable abutment for actuating said controlling or throttling valve, said abutment being actuated by differential pressures on its opposite sides the one side being exposed to the pressure in the brake cylinder plus that of a spring, substantially as described.

6. A load brake apparatus comprising in combination with a train pipe auxiliary reservoir, cylinder, and triple valve, the valve mechanism having a casing provided with connections leading from the triple valve to the cylinder and a connection to the train-pipe, a valve controlling said connection from the triple to the cylinder to cut off the flow of pressure on the light car, a movable abutment for actuating said throttling valve, said abutment being subject to differential fluid pressures on its opposite sides, the pressure on one side being that of the brake cylinder, substantially as described.

808,704. FENCE ANCHOR AND DRIVER. JAMES M. VAN METER, Cambridge City, Ind., assignor of one-half to Frank W. Marson, Cambridge City, Ind. Filed Sept. 26, 1904. Serial No. 225,897.

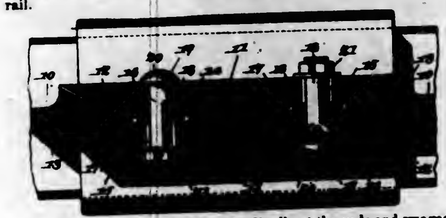


Claim.—A fence-anchor driver comprising a hollow open-ended sheath, the interior walls of which are straight and uncorrugated, one end of the sheath being slotted to receive a fence-wire, the sheath further provided intermediate its ends with registering apertures in the opposite walls thereof a solid blade receivable in and of a contour corresponding to the interior area of the sheath, an enlarged tamping-head on one end of the blade for limiting its inward movement, the blade being also provided intermediate its ends with an aperture therethrough which aperture, when the blade is wholly received in the sheath is brought into alinement with the apertures in the sheath and which aperture is of the same size as the apertures in the sheath, and a resilient split pin of a size equal to the diameter of the apertures, the pin receivable in and frictionally engaging the walls of the apertures to effectually prevent any movement of the blade relative to the sheath.

808,705. RAILWAY-RAIL JOINT. EDWARD B. VERMEUIL, Batson, Tex. Filed May 17, 1905. Serial No. 260,891.

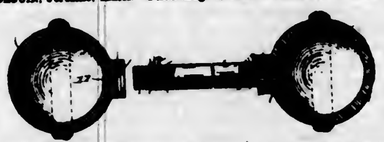
Claim.—1. Railway-rails divided longitudinally at the ends and swaged laterally in the webs and with the terminals of the divided portion reversely inclined, spaced bolt-apertures in the swaged portion with one of the apertures surrounded by an annular stud and the other aperture provided with an elongated socket for receiving the annular stud of the other rail when the divided portions are overlapped, and clamp-bolts operating through said apertures.

2. Railway-rails divided longitudinally at the ends and swaged laterally in the webs and with the terminals of the divided portion reversely inclined, spaced bolt-apertures in the swaged portion with one of the apertures surrounded by an annular stud and the other aperture provided with an elongated socket for receiving the annular stud of the other rail when the divided portions are overlapped, and clamp-bolts operating through said apertures, and formed with square sections next their heads for engaging said square sockets, and with nuts on the threaded ends for bearing against the opposite face of the rail.



3. Railway-rails divided longitudinally at the ends and swaged laterally in the webs and with the terminals of the divided portion reversely inclined, spaced bolt-apertures in the swaged portion with one of the apertures surrounded by an annular stud and the other aperture provided with an elongated socket for receiving the annular stud of the other rail when the divided portions are overlapped, clamp-bolts operating through said apertures, clamp-plates bearing over the tie-flange portions of the overlapping rail-sections and extending beneath the same and provided with depending flanges, and clamp-bolts operating through said flanges.

808,706. DUMB-BELL AND INDIAN CLUB. SAINT C. VILLEBROUIN, Jeremie, Haiti. Filed Aug. 4, 1905. Serial No. 272,730.



Claim.—1. An implement of the class described comprising two hollow spherical bodies each having a threaded aperture leading through one side, and with recesses in the apertures near the outer ends, a connecting-bar having threaded ends for detachably engaging said threaded apertures, and a spring-controlled catch member carried by said bar and yieldably engaging said recesses, to form a locking means between the bar and spherical members.

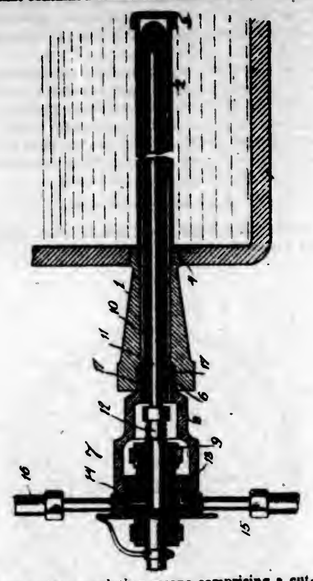
2. An implement of the class described comprising two hollow spherical bodies each having a threaded aperture leading through one side, and with recesses in the apertures near the outer ends, a connecting-bar having threaded ends for detachably engaging said threaded apertures, and with longitudinal cavities adjacent to the threads on the bar, pawls movably disposed in said cavities for engagement with said recesses when the bar is connected to the spherical bodies, and springs operating to maintain said pawls yieldably distended.

3. An implement of the class described comprising a hollow spherical member having a threaded aperture leading through one side and with a recess within the aperture near the outer end, a bar threaded to engage said aperture, a pawl spring supported and connected to said bar for engagement with said recess, and a filler member between said bar and spherical body and merging at the ends respectively into said bar and spherical body.

808,707. TEMPERATURE-REGULATING MEANS. WILLARD WADSWORTH, Plainfield, N. J., assignor to William B. Wadsworth, Plainfield, N. J. Filed Aug. 11, 1905. Serial No. 273,765.

Claim.—1. In temperature-regulating means, a socket member having means for securing it to a tank, and means for removably supporting a regulator therein, said socket, closed to admission of liquid from within the tank but provided with means admitting liquid thereto from an outside source.

2. In temperature-regulating means, a cut-off socket arranged to be secured to a tank, and having a portion adapted to be received within the tank, said socket provided with means for removably supporting a regulator, and means for supplying to the socket liquid other than that contained within the tank.



3. Temperature-regulating means comprising a cut-off socket arranged to be secured to a tank and closed to admission of liquid from within said tank, said socket having means for removably supporting a regulator, and a regulator supported thereby, provided with a thermostatic device received within said socket, said temperature-regulating means provided with means for supplying liquid to the socket, other than that contained within the tank.

4. The combination with a cut-off socket arranged to be secured to a tank, and having means for removably supporting a regulator, of a regulator supported thereby, provided with a thermostatic device received within said socket, and means admitting liquid to said regulator for control thereby, said regulator having a passage for supplying liquid to within said socket.

5. In temperature-regulating means, the combination with a cut-off socket arranged to be secured to a tank, and having a portion adapted to be received within the tank but closed to admission of liquid therefrom, of a thermostatic device removably supported within said socket, a regulating-valve controlled by said thermostatic device, means for supplying liquid to be controlled by said valve, and a branch connection for supplying liquid to within said socket, around said thermostatic device.

6. In temperature-regulating means, the combination with a cut-off socket comprising a socket member 1 arranged to be secured to a tank, and a closed tube 2 adapted to extend within the tank, said socket having means for removably supporting a regulator, of a regulator so supported, said regulator having a passage 17 communicating with the interior of the socket.

808,708. CLAMP. RAMSEY R. WHEATS, Spokane, Wash. Filed Sept. 20, 1905. Serial No. 279,207.

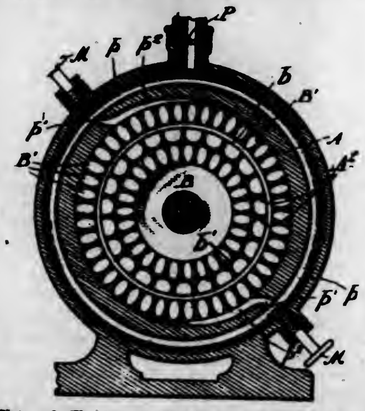
Claim.—1. An angular clamp of the class described, composed of a single piece of suitable material having longitudinal grooves formed therein, one of said grooves extending along the bottom and forming a continuation of the other groove.

2. An angular clamp of the class described, composed of a sin-

gle piece of metal having longitudinal grooves formed therein, one of said grooves being shallow and wide and the other groove being relatively narrow and rounded in cross-section, said second groove extending from the bottom of the first groove and forming a continuation thereof.

3. An angular clamp of the class described, composed of a single piece of metal having side flanges with holes therein, and between said flanges, provided with two longitudinal grooves, one of said grooves being wide and shallow and adapted to slidably receive and house a flat strap, and the other groove extending along the bottom of the first-named groove and adapted to slidably receive and house a rope or cord, substantially as described.

808,709. **TURBINE-ENGINE.** EDGAR J. WOOD, New York, N. Y. Filed Jan. 26, 1905. Serial No. 242,886.



Claim.—1. The steam-turbine described having its buckets hollow-faced on each side and two independent belts, *p* and *q*, arranged side by side in the periphery with connections for keeping them filled with steam, adapted to serve substantially as herein specified.

2. The steam-turbine described having two or more annular series of buckets hollow-faced on each side in combination with fixed buckets hollow on each face arranged annularly between with a clear space for the same to traverse around in each of the spaces thus provided and with a casing having provisions for discharging jets of steam to act on either face.

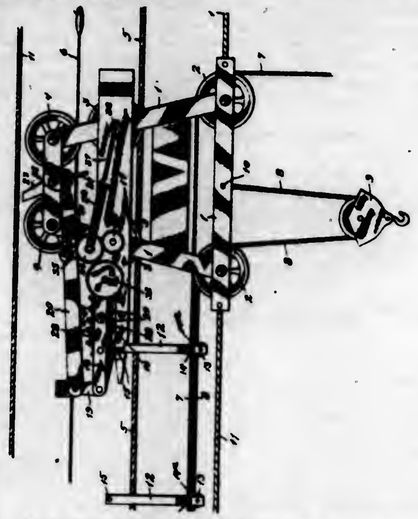
3. The steam-turbine described having hollow-faced buckets adapted to receive the current in either direction in combination with two valves and connected passages or belts extending separately quite around the wheel arranged to supply steam at full pressure and having contracted discharge from each arranged for driving in either direction at will all substantially as herein specified.

4. In a steam-turbine having moving buckets delivering steam into fixed buckets and fixed buckets delivering steam into moving buckets the deep annular spaces *b* adapted to allow a continuous rearward current of steam between the delivery edges of the buckets B' and the receiving edges of the fixed buckets A^2 two continuous channels or belts *p* and *q*, arranged independently around, the perforations *p'*, and passages p^3, leading from each in opposite directions, and valves Q arranged to control the admission of steam into the belts, and valves M arranged to control the flow of steam from each belt through such perforations and connected passages beyond adapted to serve substantially as herein specified.

5. In a steam-turbine having moving buckets delivering steam into fixed buckets delivering steam into moving buckets, the deep annular spaces *b* adapted to allow a continuous rearward current of steam between the delivery edges of the buckets B' and the receiving edges of the fixed buckets A^2 and also the deep annular spaces *b'* adapted to allow a continuous forward current of steam between the delivery edges of the fixed buckets and the receiving edges of the moving buckets all substantially as herein specified.

808,710. **FALL-ROPE CARRIER.** EDWARD K. YOUNG, Middle Port, Ohio. Filed May 17, 1905. Serial No. 260,782.

Claim.—1. In a device for gathering and distributing fall-rope carriers, a carriage provided with a shoe adapted to receive the carriers, means associated with the shoe for moving the carriers backward or forward thereon, and means for intermittently imparting motion to the moving means.



2. In a device for gathering and distributing fall-rope carriers, a carriage provided with a shoe adapted to receive the carriers, a movable device for retaining the carriers on the shoe, means for intermittently operating the movable device to allow the carriers to be removed from the shoe, and means for moving the carriers onto and off of the shoe.

3. In a device for gathering and distributing fall-rope carriers, a carriage provided with a shoe adapted to receive the carriers, a movable device for retaining the carriers on the shoe, means for intermittently operating the movable device to allow the carriers to be removed from the shoe, means for moving the carriers onto and off of the shoe, and means for intermittently imparting motion to the carrier-moving means.

4. In a device for gathering and distributing fall-rope carriers, a carriage provided with a shoe adapted to receive the carriers, a latch supported over the shoe for retaining the carriers thereon, and tripping device connected to the latch for intermittently moving the same out of the path of the carriers.

5. In a device for gathering and distributing fall-rope carriers, a carriage provided with a shoe adapted to receive the carriers, and an endless device associated with the shoe for moving the carriers therealong.

6. In a device for gathering and distributing fall-rope carriers, a carriage provided with a shoe adapted to receive the carriers, an endless device associated with the shoe for moving the carriers therealong, and means for intermittently imparting motion to the endless device.

7. In a device for gathering and distributing fall-rope carriers, a carriage provided with a shoe adapted to receive the carriers, means for moving the carriers along the shoe, means for imparting motion to the said moving means normally out of engagement therewith, and means for throwing the parts into engagement to transmit motion to the moving means.

8. In a device for gathering and distributing fall-rope carriers, a carriage provided with a shoe adapted to receive the carriers, a latch device for retaining the carriers on the shoe, means for moving the carriers along the shoe, and means for simultaneously operating the latch device and setting the moving means to operate.

9. In a device for gathering and distributing fall-rope carriers, a carriage provided with a shoe adapted to receive the carriers, means associated with the shoe for moving the carriers therealong, and means for locking said moving means against operation.

808,711. **COMBINED AIR-BRAKE-SETTING DEVICE AND ALARM.** ROBERT B. ADDISON and FRANCIS M. STAMBAUGH, St. Louis, Mo.; said Stambaugh assignor to said Addison. Filed Apr. 14, 1905. Serial No. 255,694.

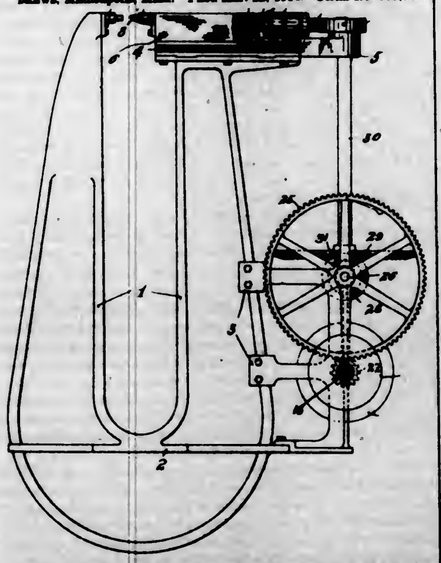
Claim.—1. In a device of the class described, a valve-casing having inlet and exhaust ports; a valve normally closing the inlet-port; a second valve operating through the first-mentioned valve and adapted to seat on either end of said first-mentioned valve; and an operating-handle for said valves; substantially as specified.

2. In a device of the class described, a valve-casing; a whistle attached thereto, there being inlet and exhaust ports in the valve-casing, and there being ports into the whistle-casing, a valve operating in the valve-casing and normally closing the inlet-port; a second valve operating through the first-mentioned valve for controlling the flow of air to the ports in the whistle; and a single operating-handle for both valves; substantially as specified.

3. In a device of the class described; a valve-casing provided with inlet and exhaust ports; a whistle attached to said valve-casing; a valve located in said valve-casing and normally closing the passage between the inlet and exhaust ports; a second valve operated through the first-mentioned valve and which second valve is adapted to seat at each end of the first-mentioned valve, there being an aperture formed in the upper end of said second valve; and a valve-operating finger passing through said aperture; substantially as specified.

4. In a device of the class described, the combination with the air-brake mechanism of a train, of a tubular connection from one end of the air-brake pipes; a valve-casing connected to said tubular connection in which valve-casing is formed inlet and exhaust ports; an alarm connected to said valve-casing; a suitable connection from said valve-casing to the alarm; a valve closing the passage from the inlet-port to the exhaust-port; a second valve operating through the first-mentioned valve and adapted to seat at each end thereof, and a handle for actuating both valves; substantially as specified.

808,712. **MACHINE FOR PUNCHING METAL.** GEORGE C. ANDREWS, Minneapolis, Minn. Filed Mar. 22, 1904. Serial No. 199,243.



Claim.—1. In a machine of the character described, the combination with a pair of coöperating tools for action on the work under pressure, of supports for said tools, a perforated anvil-block in one of said supports back of the tool held thereby, and a puncturable safety-plate seated in said latter-noted support between said anvil-block and the adjacent end of the tool, whereby said safety-plate will be punctured by the said tool and coöperating anvil-block under excessive pressure.

2. In a machine of the character described, the combination with a pair of tools for action on the work under pressure, of supports for said tools, one thereof being movable with respect to the other, a plate-receiving pocket in one of said supports, a puncturable safety-plate fitting in said pocket, back of the stem of one of the tools, an annular anvil seated in the said support, back of said pocket, and an open second pocket in the said support connected with the former pocket by a passage forming an extension of the passage through said anvil, substantially as described.

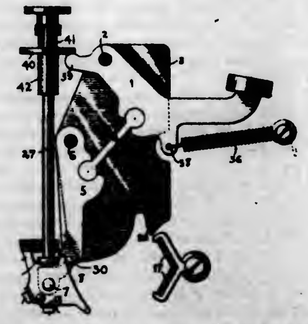
808,713. **BALL.** ROLLO APPLEYARD, Silvertown, England. Filed June 20, 1904. Serial No. 213,280.

Claim.—1. A new article of manufacture consisting of a ball, the wound portion of which is formed of a winding of elastic cord composed of three or more longitudinal threads or strands cross-connected, all parts of the cord being composed entirely of caoutchouc, substantially as set forth.

2. A new article of manufacture consisting of a ball, the wound portion of which is formed of a winding of elastic cord of flattened cross-section composed of three or more longitudinal threads or strands cross-connected, all parts of the cord being composed entirely of caoutchouc, substantially as set forth.

3. A new article of manufacture consisting of a ball, the wound portion of which is formed of a winding of elastic cord composed of three or more threads or strands plaited together, the whole being formed of caoutchouc, substantially as set forth.

808,714. **TYPE-WRITING MACHINE.** HORACE L. ARNOLD, Brooklyn, N. Y., assignor to Union Typewriter Company, Jersey City, N. J., a Corporation of New Jersey. Filed Oct. 3, 1897. Serial No. 654,808.



Claim.—1. In a type-writing machine, the combination of a pivoted type-carrier carrying a plurality of types, a stationary guiding-surface coacting with a sliding surface on said carrier for positively controlling the position of the carrier while moving radially from the non-printing toward the printing position, and means for positively controlling the type-carrier to bring any desired type to the printing position.

2. In a type-writing machine, the combination of a key-lever, a carrying-lever connected thereto and having at its free end a pivoted type-carrier provided with a sliding surface, and a stationary guiding-surface to coact therewith to control the position of the type-carrier in its movements to and from the printing position, said stationary guiding-surface being arranged between said type-carrier and the fulcrum of said carrying-lever.

3. In a type-writing machine, the combination of a pivoted lever connected to an actuating-key, a type-carrier pivoted upon said lever and provided with a curved sliding surface, and a stationary curved guiding-surface to match said sliding surface on the type-carrier, the curve of said stationary guiding-surface being substantially concentric to the pivot of said lever.

4. In a type-writing machine, the combination of a pivoted type head or carrier having two characters thereon, a movable device adapted to directly engage with said type head or carrier to cause a partial revolution of the same at the will of the operator, so as to bring the second character thereon to the printing position, and independent fixed means on the framework of the machine for directly engaging said type head or carrier on its return stroke and restoring it to normal position.

5. In a type-writing machine, the combination of a pivoted type-carrier having two types thereon, a movable abutment adapted to be projected into the path of travel of said carrier and cause it to make a partial revolution so as to bring the second type thereon to the printing position, and a cam for restoring said carrier to normal position on its return stroke.

6. In a type-writing machine, the combination of a pivoted type head or carrier having two types thereon, a movable abutment in line with the printing-point for turning said carrier to bring the second character thereon to the printing position, and independent means adapted to engage said carrier on its return stroke and restore it to normal position.

7. In a type-writing machine, the combination of a pivoted type-carrier having two types, the first of which is by means on the framework of the machine normally guided always to the printing-point, and means for turning said carrier while in transit to the printing-point so as to bring the second character thereon into the printing position when desired.

8. In a type-writing machine, the combination of a pivoted type head or carrier having two types thereon and having also a rigid projection, an abutment adapted to be moved into the path of said projection to cause a partial revolution of the said type head or carrier to bring the second type thereon to the printing position, and a fixed projection adapted to engage another rigid projection on said type-head carrier and restore the latter to normal position on its return stroke.

9. In a type-writing machine, the combination of a pivoted type-carrier having two types thereon and also a projection, and a spring-pressed rod carrying an abutment adapted to engage said projection, to turn the carrier to bring the upper-case type to printing position, and said abutment being also constructed to guide and support said carrier when the lower-case type is approaching and when it is at the printing position.

10. In a type-writing machine, the combination of a pivoted type-carrier having two types thereon and also a projection and a finger, a movable abutment to engage said projection, and a fixed abutment for said finger to strike against so as to limit the turning action of said type-carrier.

11. In a type-writing machine, the combination of a pivoted type-carrier having two types, a projection, and a finger, a seat between said last-mentioned devices, a fixed abutment and a spring-pressed rod provided with a disk which is shaped on its under side to fit said seat.

12. In a type-writing machine, the combination of a pivoted type-carrier having two types thereon and also a projection and a finger, means coacting with said projection for turning said carrier, and a stationary abutment coacting with said finger to accurately define the position of the second type while printing therewith.

13. In a type-writing machine, the combination of a lever connected to a finger-key, a type-carrier pivoted at the free end of said lever and having two types thereon and formed with a guiding-surface and a projection, a stationary guiding-surface, and a movable abutment for engaging said projection.

14. In a type-writing machine, the combination of a lever connected to the finger-key, a type-carrier pivoted to said lever and having two types and also a curved guiding-surface, a projection, and a finger, a stationary guiding-surface, a movable abutment to cooperate with said projection, and a fixed abutment to cooperate with said finger.

15. In a type-writing machine, the combination of a lever connected to the finger-key, a type-carrier pivoted thereon and having two types and also a curved guiding-surface, a stationary guiding-surface, and a movable abutment having a guiding-surface to cooperate with that on the said carrier.

16. In a type-writing machine, the combination of a pivoted type-carrier carrying a plurality of types having their faces the same distance from the pivot of said carrier, and stationary means for guiding said type-carrier as it swings toward the center and independent shiftable means for turning said carrier whereby either of the types carried thereby may be brought into operative position at the will of the operator.

17. In a type-writing machine, the combination of a pivoted type-carrier carrying a plurality of types having their faces the same distance from the pivot of the carrier and provided with suitable projections, and suitable coacting stationary and movable engaging surfaces whereby either of the types on said carrier may be brought into the printing position at the will of the operator.

18. In a type-writing machine, the combination of a lever and a type head or carrier pivoted thereto and carrying a plurality of types, the face of each of which types is arranged at right angles to a radius drawn through the center of the type and through the axis on which said carrier is pivoted, and a stationary device constructed to directly engage and intercept said carrier and cause the latter to turn upon its pivot and to positively guide the head in its turning movement.

19. In a type-writing machine, a pivoted type head or carrier provided with two type characters located in radial seats formed in said carrier, and a stationary device constructed to directly engage and intercept said carrier and cause the latter to turn upon its pivot and to positively guide the carrier in its turning movement.

20. In a type-writing machine, a type head or carrier bearing two type characters located on plane faces tangent to the same inscribed circle which has its axis coincident with the pivot on which the said carrier turns, and a stationary device constructed to directly engage and intercept said carrier and cause the latter to turn upon its pivot and to positively guide the carrier in its turning movement.

21. In a type-writing machine, a type-carrier comprising two cheek-plates forming seats therebetween for the shanks of two radially-arranged types, and a single clamping-screw engaging said cheek-plates for securing said types in their seats.

22. In a type-writing machine, the combination of an inking-pad, a pivoted type-carrier provided with an extension, and a single projection for engaging said extension and causing the carrier to turn and present its types to the said inking-pad.

23. In a type-writing machine, the combination of an inking-pad, a type arm or lever, a type-carrier pivoted to said type-arm to swing in the general direction of movement of the type-lever and having two types, and means for controlling the position of the two types at their idle or non-printing position, said controlling means including an intercepting device arranged in the path of said type-carrier.

24. In a type-writing machine, the combination of an inking-pad, a type arm or lever, a type-carrier pivoted to said type-arm to swing in the general direction of movement of the type-lever and having two types, and means for turning said carrier as it approaches said inking-pad and causing the faces of both said types to be brought thereagainst, said turning means including an intercepting device arranged in the path of said type-carrier.

25. In a type-writing machine, the combination of an inking-pad, a type-carrier provided with two types and with an extension, and stationary means for positively turning said carrier in the movement thereof toward and from the printing position and so as to bring said types against the inking-pad.

26. In a type-writing machine, the combination of an inking-pad, a type-carrier provided with two types, an extension and a guiding-surface, a fixed guiding-surface, and a fixed cam or abutment.

27. In a type-writing machine, the combination of a pivoted type-carrier having two radially-arranged types, an inking-pad having two angularly-arranged surfaces, and means for turning said type-carrier to present both of said types to said inking-surfaces said type-carrier being pivoted upon and wholly operated by a single swinging arm and having a pivotal movement on said arm in the general direction of the plane of movement of the arm.

28. In a type-writing machine, the combination of a pivoted type-carrier having two radially-arranged types and an extension, an inking-pad having two angularly-arranged inking-surfaces, and a fixed cam or abutment for turning said carrier.

29. In a type-writing machine, the combination of a pivoted type-carrier having two types and adapted to travel from an inking-pad to the printing-point, means for turning said carrier as it approaches said inking-pad so as to bring both type-faces thereagainst, means for guiding said type-carrier to the printing-point, and means adapted to be projected into the path of travel of the said type-carrier to turn the same, whereby either of the inked types may be presented to the paper at the will of the operator.

30. In a type-writing machine, the combination of a pivoted type-carrier having two radially-arranged types, a guiding-surface, an extension, a projection, and a finger, an inking-pad, a fixed guiding-surface, a fixed cam, a movable abutment, and a fixed abutment.

31. In a type-writing machine, the combination of a lever connected to the finger-key, a type-carrier pivoted on said lever and provided with two radially-arranged types, a guiding-surface, an extension, a projection and a finger, an inking-pad, a fixed cam, stationary guiding-surfaces, a movable abutment, and a fixed abutment.

32. In a type-writing machine, the combination of a type-carrier-supporting lever, a finger-key operatively connected thereto, a type-carrier pivoted on the free end of said lever and having radially-arranged upper and lower case types, an inking-pad constructed to simultaneously ink both of said types, means for guiding said carrier to the printing-point for printing the lower-case character, and means controlled by a separate finger-key for turning said carrier while in transit so as to bring the upper-case character into printing position.

33. In a type-writing machine, the combination of a key-lever, a retaining-spring, a type-carrier-supporting lever, a connection between said levers, a type-carrier pivoted at the free end of said supporting-lever and having two radially-arranged types, an inking-pad, means for guiding said type-carrier in its movements from said pad to the printing position and back, means for turning said carrier as it arrives at the inking position, and means controlled by a separate key for turning said carrier as it arrives at the printing position.

34. In a type-writing machine, the combination of a vibratory lever, a type-carrier pivoted thereon, an inking-pad, an intercepting device for causing said type-carrier to turn to present the type to the pad, and a separate intercepting device for causing said carrier to turn to bring the type to printing position.

35. In a type-writing machine, the combination of a vibratory lever, a type-carrier pivoted thereon, and having radially-arranged upper and lower case types, an inking-pad constructed to simultaneously ink both of said types, an intercepting device for causing said type-carrier to turn to present the types to the pad, and a separate device for causing said carrier to turn to bring the upper-case character into printing position.

36. In a type-writing machine, the combination of a vibratory lever, a type-carrier pivoted thereon and having radially-arranged upper and lower case types, an inking-pad constructed to ink both of said types simultaneously, an intercepting device for causing said type-carrier to turn to present the types to the pad, a separate intercepting device for causing the carrier to turn to bring the lower-case type into printing position, and a separate device for causing said type-carrier to turn to bring the upper-case type into printing position.

37. In a type-writing machine, the combination with a vibratory lever, of a finger-key operatively connected thereto, a type-carrier pivoted upon said vibratory lever and having radially-arranged upper and lower case types, an inking-pad constructed to ink both of said types simultaneously, an intercepting device for causing said type-carrier to turn to present the types to the pad, a separate intercepting device for causing the carrier to turn to bring the lower-case type into printing position, and a device operated by a separate finger-key for causing said type-carrier to turn to bring the upper-case type into printing position.

38. In a type-writing machine, the combination of a vibratory lever, a type-carrier pivoted thereon and having a lower-case type which swings with said carrier in the general direction of the plane of movement of said lever, and fixed means for causing said type-carrier to positively turn on its pivot during a vibration of said lever toward the printing position to guide it in such movement, and so as to cause said lower-case type to turn to the printing position.

39. In a type-writing machine, the combination of a vibratory lever, a type-carrier pivoted thereon and having a lower-case type, fixed means for causing said type-carrier to turn on its pivot during a vibration of said lever toward the printing position and so as to cause said lower-case type to turn to the printing position and additional means for causing said type-carrier to be turned on its pivot during the return stroke of said lever and so as to bring said lower-case type back to normal position.

40. In a type-writing machine, the combination of a vibratory lever, a type-carrier pivoted thereon and having a lower-case and an upper-case type, fixed means coacting to turn said type-carrier and bring the lower-case type to printing position, and independent movable means adapted to coact with said carrier to cause the latter to be turned and the upper-case type to be brought to printing position, at the will of the operator.

41. In a type-writing machine, the combination of a vibratory lever, a type-carrier pivoted thereon and having a lower-case and an upper-case type, fixed means coacting to turn said type-carrier and bring the lower-case type to printing position, independent movable means adapted to coact with said carrier to cause the latter to be turned and the upper-case type to be brought to printing position at the will of the operator, and independent means coacting with said carrier on its return stroke for restoring it to normal position.

42. In a type-writing machine, the combination of a vibratory lever, a type-carrier pivoted thereon and having radially-arranged upper and lower case types, an intercepting device for causing the carrier to turn to bring the lower-case type into printing position, and a separate intercepting device for causing said carrier to turn to bring the upper-case type into printing position.

43. In a type-writing machine the combination of a vibratory lever, a type-carrier pivoted thereon and having radially-arranged upper and lower case types, an intercepting device for causing the carrier to turn to bring the lower-case type into printing position, a separate device for causing said carrier to turn to bring the upper-case type into printing position, and an additional intercepting device for causing said type-carrier to turn back to normal position on the return stroke of said vibratory lever.

44. In a type-writing machine, the combination of a vibratory lever, a type-carrier pivoted thereon, a guiding-plate having a curved edge, and a coacting curved edge on the type-carrier.

45. In a type-writing machine, the combination of a vibratory lever, a type-carrier pivoted thereon, and a guiding-plate having a curved edge, a cam or projection 20 and a notch 21; and said type-carrier having a coacting curved edge and an extension 19.

46. In a type-writing machine, the combination of a vibratory lever, a type-carrier pivoted thereon and having an extension 19, a curved guiding edge 24, a projection 30, a finger 34, and an upper and a lower case type, a guiding-plate having a curved edge, a cam or projection 20 and a notch 21, and a movable abutment as 26.

47. In a type-writing machine, the combination of a vibratory lever, a type-carrier pivoted thereon and having an extension 19, a curved guiding edge 24, a projection 30, a finger 34, upper and lower case types, and a notch or seat 35, a guiding-plate having a curved edge, a cam or projection 20 and a notch 21, and a key-actuated head 26 having a surface adapted to coact with the curved edge 24 and with the notch or seat 35.

48. In a type-writing machine, the combination of a vibratory lever, a type head or carrier pivoted thereon and having an upper and a lower case type, an inking-pad on which said types normally rest, a movable device adapted to directly engage one rigid part of said type head or carrier to turn the upper-case type to printing position on the inward stroke of said lever, and another fixed device adapted to directly engage another rigid part of said type-carrier during the return stroke of said lever and cause said type-carrier to turn back to normal position with the types resting on the inking-pad.

49. In a type-writing machine, the combination of a pivoted type head or carrier, an inking-pad on which the type or types on said head normally bear, and means for positively and directly engaging said type head or carrier during its printing movement to turn it from the inking-pad and to bring it to the printing position and to guide it during such movement.

50. In a type-writing machine, the combination of a pivoted type head or carrier, an inking-pad on which the type or types on said head normally bear, means for positively and directly engaging said type head or carrier throughout or substantially throughout its movements to and from the printing position to turn it away from the inking-pad during the movement of the carrier in one direction and to turn it toward the ink-pad during movement of the carrier in the opposite direction and to guide the carrier during such movements.

51. In a type-writing machine, the combination of a pivoted type head or carrier, an inking-pad on which the type or types on said head normally bear, and means for positively and directly engaging said type head or carrier during its printing movement to turn it from the inking-pad and to bring it to the printing position and to guide it during such movement and to hold it fixed against lateral movement or vibration when in the printing position.

52. In a type-writing machine, the combination of a pivoted key-actuated type head or carrier, and a fixed guide with which said head contacts throughout or substantially throughout its movement to and from the normal position and by which the type-head is positively turned and guided to the printing position.

53. In a type-writing machine, the combination of a pivoted key-actuated type head or carrier carrying a plurality of types, a fixed guide with which said head contacts throughout or substantially throughout its movement to and from the normal position and by which the type-head is positively turned and guided to the printing position, and independent means within the control of the operator for determining the particular type on the carrier to be presented to the printing position.

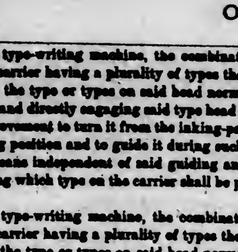
54. In a type-writing machine, the combination of a pivoted type head or carrier having a plurality of types thereon, an inking-pad on which the type or types on said head normally bear, means for positively and directly engaging said type head or carrier during its printing movement to turn it from the inking-pad and to bring it to the printing position and to guide it during such movement, and controlling means independent of said guiding and turning means for determining which type on the carrier shall be presented in position to print.

55. In a type-writing machine, the combination of a pivoted type head or carrier having a plurality of types thereon, an inking-pad on which the type or types on said head normally bear, means for positively and directly engaging said type head or carrier throughout or substantially throughout its movements to and from the printing position to turn it away from the inking-pad during the movement of the carrier in one direction and to turn it toward the ink-pad during the movement of the carrier in the opposite direction and to guide the carrier during such movements, and controlling means independent of said guiding and turning means for determining which type on the carrier shall be presented in position to print.

56. In a type-writing machine, the combination of a pivoted type head or carrier having a plurality of types thereon, an inking-pad on which the type or types on said head normally bear, means for positively and directly engaging said type head or carrier throughout or substantially throughout its movements to and from the printing position to turn it away from the inking-pad during the movement of the carrier in one direction and to turn it toward the ink-pad during the movement of the carrier in the opposite direction and to guide the carrier during such movements, and controlling means independent of said guiding and turning means for determining which type on the carrier shall be presented in position to print, said controlling and guiding and turning means coöperating with said type-carrier to maintain it fixed against lateral vibration or movement when it is in the printing position.

57. In a type-writing machine, the combination of a pivoted type head or carrier, an inking-pad against which the type or types on said carrier normally rest, and a fixed slide on which said type-carrier slides throughout or substantially throughout the movements of the carrier to and from the printing position and which is effective to turn the carrier toward and away from the inking-pad and toward and away from the printing position.

808,715. **PRINTER'S COMPOSING-STICK.** FRANK M. BARKER, Chicago, Ill., assignor to Harry B. Rouse, Chicago, Ill. Filed July 19, 1904. Serial No. 217,201.



Claim.—1. A composing-stick including a knee carrying a tooth and a back wall provided with teeth, the rear edge of the tooth carried by the knee sloping upwardly and rearwardly away from the end wall of the stick while the front edges of the teeth upon the back wall slope downwardly toward the end wall of the stick, substantially as described.

2. A composing-stick including a knee carrying a tooth and a back wall provided with teeth, the rear edge of the tooth carried by the knee sloping upwardly and rearwardly away from the end wall of the stick while the front edges of the teeth upon the back wall slope downwardly toward the end wall of the stick, the remaining edge of the tooth upon the knee being adapted for engagement with any of the remaining edges of the teeth upon the back wall, substantially as described.

3. A composing-stick including a knee carrying a tooth movably mounted with respect to the knee and a back wall provided with teeth, the rear edge of the tooth carried by the knee sloping upwardly and rearwardly away from the end wall of the stick while the front edges of the teeth upon the back wall slope downwardly toward the end wall of the stick, substantially as described.

4. A composing-stick including a knee carrying a tooth movably mounted with respect to the knee and a back wall provided with teeth, the rear edge of the tooth carried by the knee sloping upwardly and rearwardly away from the end wall of the stick while the front edges of the teeth upon the back wall slope downwardly toward the end wall of the stick, the remaining edge of the tooth upon the knee being adapted for engagement with any of the remaining edges of the teeth upon the back wall, substantially as described.

5. A composing-stick including a knee carrying a tooth having spring anchorage upon the knee and a back wall provided with teeth, the rear edge of the tooth carried by the knee sloping upwardly and rearwardly away from the end wall of the stick while the front edges of the teeth upon the back wall slope downwardly toward the end wall of the stick, substantially as described.

6. A composing-stick including a knee carrying a tooth having spring anchorage upon the knee and a back wall provided with teeth, the rear edge of the tooth carried by the knee sloping upwardly and rearwardly away from the end wall of the stick while the front edges of the teeth upon the back wall slope downwardly toward the end wall of the stick, the remaining edge of the tooth upon the knee being adapted for engagement with any of the remaining edges of the teeth upon the back wall, substantially as described.

7. A composing-stick including a knee carrying a tooth movably mounted with respect to the knee and a back wall provided with teeth, the rear edge of the tooth carried by the knee sloping upwardly and rearwardly away from the end wall of the stick while the front edges of the teeth upon the back wall slope downwardly toward the end wall of the stick, and locking mechanism for maintaining engagement between the teeth, substantially as described.

8. A composing-stick including a knee carrying a tooth movably mounted with respect to the knee and a back wall provided with teeth, the rear edge of the tooth carried by the knee sloping upwardly and rearwardly away from the end wall of the stick while the front edges of the teeth upon the back wall slope downwardly toward the end wall of the stick, the remaining edge of the tooth upon the knee being adapted for engagement with any of the remaining edges of the teeth upon the back wall, and locking mechanism for maintaining engagement between said tooth and any of said teeth, substantially as described.

9. A composing-stick including a knee carrying a tooth having spring anchorage upon the knee and a back wall provided with teeth, the rear edge of the tooth carried by the knee sloping upwardly and rearwardly away from the end wall of the stick while the front edges of the teeth upon the back wall slope downwardly toward the end wall of the stick, and locking mechanism for maintaining engagement between the teeth, substantially as described.

10. A composing-stick including a knee carrying a tooth having spring anchorage upon the knee and a back wall provided with teeth, the rear edge of the tooth carried by the knee sloping upwardly and rearwardly away from the end wall of the stick while the front edges of the teeth upon the back wall slope downwardly toward the end wall of the stick, the remaining edge of the tooth upon the knee being adapted for engagement with any of the remaining edges of the teeth upon the back wall, and locking mechanism for maintaining engagement between the teeth, substantially as described.

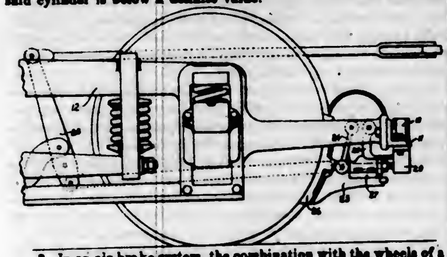
11. A composing-stick including a clamp carried by and movable with respect to the knee and provided with a cam formation fixed with respect to the clamp, and a coöperating cam provided upon the back wall of the stick with which the aforesaid cam formation may engage, substantially as described.

12. A composing-stick including a clamp carried by and movable with respect to the knee and provided with a toothed formation fixed with respect to the clamp, and coöperating teeth provided upon the back wall of the stick with which the aforesaid toothed formation may engage, substantially as described.

808,716. **BRAKE SYSTEM.** CHARLES H. BARRY, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed Aug. 13, 1903. Serial No. 169,249.

Claim.—1. In an air-brake system, a brake-shoe, a brake-cylinder controlling said shoe, a passage from said cylinder to atmosphere, a valve controlling said passage, operative connections between said valve and said brake-shoe, and means for rendering said valve inoperative when the pressure in said cylinder is below a definite value.

2. In an air-brake system, a brake-shoe associated with a wheel of the vehicle, a brake-cylinder controlling said shoe, an exhaust-passage from said cylinder to atmosphere, a valve in said passage, operative connections between said brake-shoe and said valve whereby said valve is moved to open said passage when the friction between said shoe and the wheel exceeds a definite amount, and means independent of said valve for closing said passage when the pressure in said cylinder is below a definite value.

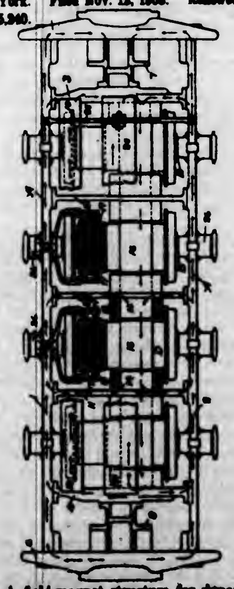


3. In an air-brake system, the combination with the wheels of a vehicle to which the system is applied, of a plurality of brake-shoes associated therewith, a brake-cylinder and brake-rigging by which pressure may be applied to said shoes, a valve controlling an exhaust-passage from said brake-cylinder, means connected to one of said brake-shoes and operable thereby when the friction between it and its wheel exceeds a definite amount to exhaust said brake-cylinder, and means for cutting off said exhaust when the brake-cylinder pressure falls to a definite point.

4. In an air-brake system, the combination with a car-truck, brake-shoes and rigging, of a valve-casing secured to said truck and provided with a central inlet-port and upper and lower exhaust-ports and having a valve yieldingly mounted so as to remain normally in a position to close said inlet-port, and connecting means between said valve and one of said brake-shoes operative upon the movement of said brake-shoe peripherally of its wheel in either direction to move said valve either up or down to establish communication between said valve inlet-port and one of said exhaust-ports.

5. In an air-brake system, the combination of a brake-cylinder, a valve arranged to control an exhaust-passage leading from said cylinder, a pressure-retaining valve located in said passage, a brake-shoe associated with one of the wheels of the vehicle, and means operated by said shoe to actuate said controlling-valve.

808,717. **ELECTRIC LOCOMOTIVE.** ASA F. BATCHELDER, Schenectady N. Y., assignor to General Electric Company, a Corporation of New York. Filed Nov. 13, 1903. Renewed June 14, 1905. Serial No. 265,940.



Claim.—1. A field-magnet structure for dynamo-electric machines, comprising an inclosing frame, one or more transverse members joining opposite sides of said frame, a plurality of pole-pieces secured to said inclosing frame and said transverse member or members, and field-windings arranged to produce a magnetic flux in a magnetic circuit common to all of said pole-pieces.

2. A field-magnet structure for dynamo-electric machines, comprising an inclosing frame with one or more transverse members joining opposite sides of said frame, the ends of the said frame and the transverse members being provided with pole-pieces, in combination with armatures operatively related to said pole-pieces, and means for producing a magnetic flux in a magnetic circuit common to all of said armatures and pole-pieces.

3. In an electric vehicle, the combination of a truck consisting of a frame having members composed of magnetic material and having pole-pieces for a plurality of armatures, motor-armatures operatively located with reference to said pole-pieces, said pole-pieces and frame members being so located and arranged that a magnetic circuit extends through said pole-pieces and thence through said frame members, and field-windings arranged to produce a magnetic flux in said magnetic circuit.

4. In an electric vehicle, the combination of a truck consisting of a frame composed of magnetic material and having pole-pieces for a plurality of armatures, said pole-pieces being so located and arranged with reference to said frame that a magnetic circuit extends through said pole-pieces and thence through said frame, motor-armatures operatively located with reference to said pole-pieces, and field-windings arranged to produce a magnetic flux in said magnetic circuit.

5. A truck for an electric vehicle, comprising an inclosing frame constituting the field-magnet structure for a plurality of armatures, one or more transverse members joining opposite sides of said frame, a plurality of pole-pieces secured to said inclosing frame and said transverse member or members, and motor-armatures operatively located with reference to said pole-pieces.

6. A truck for an electric vehicle, comprising an inclosing frame constituting the field-magnet structure for a plurality of armatures, transverse members joining opposite sides of said frame, a plurality of pole-pieces secured to said transverse members, and motor-armatures operatively located with reference to said pole-pieces.

7. A truck for an electric vehicle, comprising a frame constituting the field-magnet structure for a plurality of armatures and comprising side bars, end bars, a plurality of transverse members joining said side bars, a plurality of pole-pieces secured to said transverse members, and one or more motor-armatures operatively located with reference to said pole-pieces.

8. In an electric vehicle, the combination of a truck consisting of a frame composed of magnetic material and having pole-pieces for a plurality of armatures, driving-axles journaled in said frame, motor-armatures mounted upon said axles and operatively located with reference to said pole-pieces, said pole-pieces being so located and arranged with reference to said frame that a magnetic circuit extends through said pole-pieces and thence through said frame, and field-windings arranged to produce a magnetic flux in said magnetic circuit.

9. In an electric vehicle, the combination of a truck comprising an inclosing frame constituting the field-magnet structure for a plurality of armatures, one or more transverse members joining opposite sides of said frame, driving-axles journaled in said frame, a plurality of pole-pieces secured to said inclosing frame and said transverse member or members, and motor-armatures mounted upon said axles and operatively located with reference to said pole-pieces.

10. In an electric vehicle, the combination of a truck comprising an inclosing frame constituting the field-magnet structure for a plurality of armatures, transverse members joining opposite sides of said frame, driving-axles journaled in said frame, a plurality of pole-pieces secured to said transverse members, and motor-armatures mounted upon said axles and operatively located with reference to said pole-pieces.

11. In an electric vehicle, the combination of a truck comprising a frame constituting the field-magnet structure for a plurality of armatures, said frame comprising side bars, end bars, a plurality of transverse members joining said side bars, driving-axles journaled in said side bars, a plurality of pole-pieces secured to said transverse members, and motor-armatures mounted upon said axles and operatively located with reference to said pole-pieces.

12. In an electric vehicle, the combination of a truck consisting of a frame constituting the field-magnet structure for a plurality of armatures, driving-axles yieldingly journaled in said frame, motor-armatures mounted upon said axles, and pole-pieces secured to said frame and arranged in operative relation to said armatures.

13. In a dynamo-electric machine having a plurality of armatures, the combination of a field-magnet structure having its pole-pieces and frame arranged so as to provide a magnetic circuit common to said armatures, field-windings arranged to produce a magnetic flux in said common magnetic circuit, and means for confining any differences of flux in the different armature-fields to their respective fields.

14. In a dynamo-electric machine having a plurality of armatures, the combination of a field-magnet structure having its pole-pieces and frame arranged so as to provide a magnetic circuit common to said armatures, field-windings arranged to produce a magnetic flux in said common magnetic circuit, and means for providing local magnetic circuits whereby any differences of flux in the different armature-fields will be confined to their respective fields.

15. In a dynamo-electric machine, the combination with a frame composed of magnetic material, of pole-pieces for a plurality of armatures, said pole-pieces being so located with reference to said frame that a magnetic circuit extends through said pole-pieces and thence through said frame, field-windings arranged to produce a magnetic flux in said common magnetic circuit, and members composed of magnetic material connecting said pole-pieces and said frame.

16. In an electric vehicle, the combination with a truck consisting of a frame composed of magnetic material, of pole-pieces for a plurality of armatures, said pole-pieces being so located with reference to said frame that a magnetic circuit common to said armatures extends through said pole-pieces and thence through said frame, field-windings arranged to produce a magnetic flux in said common magnetic circuit, and means for confining any differences of flux in the different armature-fields to their respective fields.

17. In an electric vehicle, the combination with a truck consisting of a frame composed of magnetic material, of pole-pieces for a plurality of armatures, said pole-pieces being so located with reference to said frame that a magnetic circuit common to said armatures extends through said pole-pieces and thence through said frame, field-windings arranged to produce a magnetic flux in said common magnetic circuit, and means for providing local magnetic circuits whereby any differences of flux in the different armature-fields will be confined to their respective fields.

18. In an electric vehicle, the combination with a truck consisting of a frame composed of magnetic material, of pole-pieces for a plurality of armatures, said pole-pieces being so located with reference to said frame that a magnetic circuit common to said armatures extends through said pole-pieces and thence through said frame, field-windings arranged to produce a magnetic flux in said common magnetic circuit, and members composed of magnetic material connecting said pole-pieces and said frame.

19. A dynamo-electric machine comprising a field-magnet structure having pole-pieces, and an armature rotatable in the plane of the pole-pieces and movable transversely in said plane.

20. A dynamo-electric machine comprising a field-magnet structure having pole-pieces, and an armature rotatable in the plane of, and elastically mounted with relation to, said pole-pieces.

21. A dynamo-electric machine comprising a field-magnet structure having pole-pieces, and an armature rotatable in the plane of the pole-pieces and movable transversely in said plane in a path substantially parallel to the polar faces.

22. A dynamo-electric machine comprising a field-magnet structure having pole-pieces with plane polar surfaces, and an armature operatively rotatable in the plane of said pole-pieces and movable in a plane substantially parallel to said surfaces.

23. In an electric vehicle, the combination of a truck, wheeled driving-axles upon which said truck is yieldingly mounted, a motor-armature for driving one of said axles and mounted so as to partake of the movement of said axle relative to the truck, and a field-magnet structure mounted on said truck and having pole-pieces lying in the plane of rotation of, and operatively related to, said armature and movable relative thereto.

24. A dynamo-electric machine comprising a field-magnet structure having pole-pieces, an armature elastically mounted with relation to and rotatable in the plane of said pole-pieces, and brushes mounted so as to partake of the elastic movement of said armature.

25. A dynamo-electric machine comprising a field-magnet structure having pole-pieces, an armature elastically mounted with relation to and rotatable in the plane of said pole-pieces, a commutator, brushes in operative relation therewith, and means connecting said brushes and armature so as to maintain a fixed relation therebetween.

26. A dynamo-electric machine comprising a field-magnet structure having pole-pieces, yielding-mounted boxes in said structure, an armature having its shaft journaled in said boxes, a commutator for said armature, and brushes mechanically connected to said boxes so as to partake of their movement.

27. A dynamo-electric machine comprising a field-magnet structure having pole-pieces, yielding-mounted boxes in said structure, an armature having its shaft journaled in said boxes, a commutator for said armature, brushes therefor, and a yoke connected to one of said boxes and mechanically supporting said brushes in operative relation to said commutator.

28. A dynamo-electric machine comprising a field structure having pole-pieces and an armature removably journaled in said structure, said pole-pieces being so shaped that the armature may be removed transversely in the plane of the pole-pieces.

29. A dynamo-electric machine comprising a field structure having pole-pieces and an armature removably journaled in said structure, said pole-pieces being so shaped that the armature may be removed transversely in the plane of the pole-pieces and in a path substantially parallel to the polar faces of said pole-pieces.

30. In an electric vehicle, the combination of a frame or truck, a plurality of wheeled axles removably journaled therein, motor-armatures mounted directly upon said axles, and pole-pieces operatively located adjacent to said armatures and so shaped as to permit the ready removal of any axle with its wheels and armature.

31. In an electric vehicle, the combination of a frame or truck, a plurality of wheeled axles journaled therein and removable from its under side, motor-armatures mounted directly upon said axles, and pole-pieces located adjacent to said armatures and so shaped as to permit the ready removal of any axle with its wheels and armature.

32. In an electric vehicle, the combination of a truck or frame an armature yieldingly journaled in said frame, and pole-pieces secured to said frame in the plane of rotation of, and in operative relation to, said armature and so shaped as to permit a movement of said armature relative to said pole-pieces.

33. In an electric vehicle, the combination of a truck or frame, one or more wheeled axles yieldingly journaled in said frame, one or more armatures mounted on said axles, and pole-pieces secured to said frame in the plane of rotation of, and in operative relation to, said armatures and so shaped as to permit a movement of said armatures relative to said pole-pieces.

34. In an electric vehicle, the combination of a truck or frame, axle-boxes yieldingly mounted in said frame, wheeled axles journaled in said boxes, armatures mounted upon said axles, and pole-pieces secured to said frame in the plane of rotation of, and in operative relation to, said armatures and so shaped as to permit a movement of said armatures relative to said pole-pieces.

35. In an electric vehicle, the combination of a truck or frame of magnetic material, axle-boxes yieldingly mounted in said frame, wheeled axles journaled in said boxes, one or more armatures mounted on said axles, and pole-pieces secured to said frame and having their magnetic circuit or circuits completed therethrough, the said pole-pieces being operatively related to said armatures and so shaped as to permit a free movement thereof with reference to the said armatures as the axle-boxes move in the frame.

36. In an electric vehicle, the combination of a truck-frame, a plurality of wheeled axles yieldingly journaled therein, motor-armatures mounted on said axles, and pole-pieces for said armature located in the plane of rotation of the armatures and carried by the said truck.

37. In an electric vehicle, the combination of a truck-frame, a plurality of wheeled axles yieldingly journaled therein, motor-armatures mounted on said axles, and pole-pieces for said armatures located in the plane of rotation of the armatures and carried by the said truck, the said pole-pieces being constructed to permit a free movement thereof with reference to the said armatures.

38. In an electric vehicle, the combination of a truck-frame, a plurality of wheeled axles removably journaled therein, motor-armatures mounted on said axles, and pole-pieces for the said armatures located in the plane of rotation of the armatures and carried by the said truck, the said pole-pieces being constructed to permit the removal of the said armatures with the axles on which they are mounted in said plane and transversely to said pole-pieces.

39. In an electric vehicle, the combination of a truck-frame, axle-boxes yieldingly mounted in said frame and removable in a downward direction therefrom, wheeled axles journaled in said boxes, armatures mounted on said axles, and pole-pieces for the said armatures located in the plane of rotation of the armatures and carried by the said frame, the said pole-pieces being constructed to permit the removal of the said armatures with the axles on which they are mounted in said plane and transversely to said pole-pieces.

40. In an electric vehicle, a truck-frame constituting the field-magnet structure for a plurality of dynamo-electric machines, a plurality of wheeled axles yieldingly journaled in said frame, and motor-armatures mounted upon one or more of said axles in operative relation to said field-magnet structure.

41. In an electric vehicle, a truck-frame constituting the field-magnet structure for a plurality of dynamo-electric machines, a plurality of wheeled axles yieldingly journaled in said frame, and motor-armatures mounted upon said axles and operatively related to said field-magnet structure.

42. In an electric vehicle, a truck-frame constituting a field-magnet structure for a plurality of dynamo-electric machines, one or more transverse members joining opposite sides of said frame, pole-pieces secured to said transverse members, a plurality of wheeled axles yieldingly journaled in said frame, and motor-armatures mounted on said axles and operatively related to said pole-pieces, the said pole-pieces being constructed to permit free movement thereof with respect to the said armatures as the axles move with reference to the frame.

43. In an electric vehicle, the combination of a truck comprising an inclosing frame constituting the field-magnet structure for a plurality of armatures, one or more transverse members joining opposite sides of said frame, driving-axles yieldingly journaled in said frame, a plurality of pole-pieces secured to said inclosing frame and said transverse member or members, motor-armatures mounted upon said axles and operatively located with reference to said pole-pieces, and field-windings arranged to produce a magnetic flux in a magnetic circuit common to all of said pole-pieces and motor-armatures.

44. In an electric vehicle, a wheeled axle, a motor-armature on said axle, a truck-frame constituting the field-magnet structure for said armature, springs located between said axle and said frame to permit a relative vertical movement between said axle and said frame, and polar surfaces on said frame arranged vertically and parallel to the axle.

808,718. **REGULATING-TRANSFORMER.** HENRY J. BLAKESLEE, Hartford, Conn. Filed Apr. 8, 1905. Serial No. 254,479.

Claim.—1. A regulating-transformer, having a cylindrical magnetic frame, a stationary primary coil, a stationary secondary coil, and a core with its axis extending perpendicular to the plane of the primary coil and movable within the frame and the primary and secondary coils, substantially as specified.

2. A regulating-transformer having a magnetic frame, polar projections on the interior of the frame, a stationary primary coil in the interior of the frame, a stationary secondary coil encircling polar projections from the interior of the frame, and a magnetic core movable within the frame and the coils, substantially as specified.

3. A regulating-transformer having a magnetic frame, polar projections on the interior of the frame, a stationary primary coil encircling the interior of the frame, a stationary secondary coil encircling polar projections from the interior of the frame, a magnetic core movable within the frame and the coils, and a counterbalance connected with the core, substantially as specified.

4. A regulating-transformer having a magnetic frame, a stationary primary coil, a stationary secondary coil, and a core always having the same magnetic relation to the primary coil but adapted to be moved to vary its magnetic relation with the secondary coil, substantially as specified.

5. A regulating-transformer having a stationary magnetic frame and a movable core, a fixed primary coil arranged to always encircle the total flux through the core, and a fixed secondary coil so arranged that the flux through it varies from maximum to minimum according to the position of the core, substantially as specified.

6. A regulating-transformer having a cylindrical magnetic frame, polar projections on the interior of the frame, an annular primary coil fixed in the interior of the frame, a fixed secondary coil embracing polar projections from the interior of the frame, a core extending through the frame within the primary and secondary coils, and means for counterbalancing the magnetic torque of the core, substantially as specified.

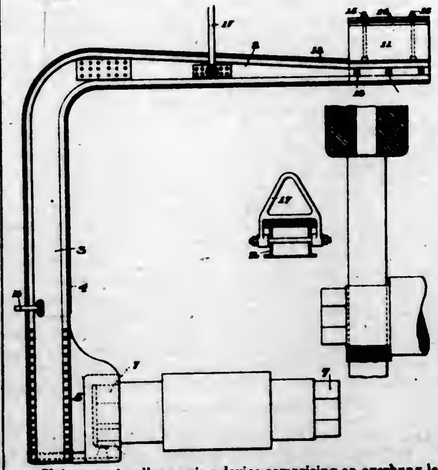
7. A regulating-transformer having a cylindrical magnetic frame, polar projections on the interior of the frame, a primary coil fixed in a recess in the middle of the frame, a secondary coil wound in reverse directions about polar projections from the interior of the frame, and a magnetic core extending through the frame and the primary and stationary coils, substantially as specified.

8. A regulating-transformer having a stationary magnetic frame, a fixed primary coil encircling the interior of the frame, a fixed secondary coil in the interior of the frame, and a magnetic core movable within the frame and the primary coil, the axis of the core extending perpendicular to the plane of the primary coil, and the said coils being arranged so that the primary always encircles the total flux through the core while the secondary varies from maximum to minimum according to the position of the core, substantially as specified.

9. A regulating-transformer having a stationary magnetic frame, a fixed primary coil encircling the interior of the frame, a fixed secondary coil in the interior of the frame, a magnetic core within the frame and the primary coil, the axis of the core extending perpendicular to the plane of the primary coil, and non-magnetic conductors attached to the core in such manner as to lie opposite inactive sections of the magnetic frame, substantially as specified.

10. A regulating-transformer having a stationary magnetic frame, a fixed primary coil encircling the interior of the frame, a fixed secondary coil in the interior of the frame, a magnetic core within the frame and the primary coil, the axis of the core extending perpendicular to the plane of the primary coil, and a counterbalance connected with and tending to rotate the core on its axis in a direction opposite to the magnetic torque, substantially as specified.

808,719. **ROLL-REMOVING DEVICE.** CHARLES W. BRAY, Pittsburg, Pa., assignor to American Sheet & Tin Plate Company, Pittsburg, Pa., a Corporation of New Jersey. Filed Feb. 1, 1905. Serial No. 243,693.



Claim.—1. A roll-removing device comprising an overhung lever having a socket in its lower portion arranged to receive the end portion of the roll; substantially as described.

2. A roll-removing device comprising an overhung lever having a socket in its lower portion, and a suspending device attached at an intermediate point of the upper arm over the intermediate part of the roll, when the roll is engaged; substantially as described.

3. A roll-removing apparatus comprising an overhung lever, the upper arm of which is provided with an intermediate supporting device, the leg having a socket with a wedge device to clamp the roll-neck in place; substantially as described.

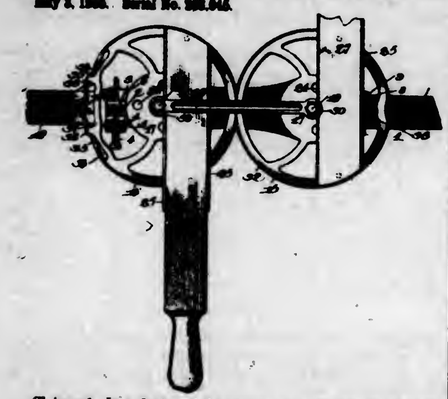
4. A roll-removing device comprising an overhung lever with a suspending device intermediate of its upper arm, the end portion of said arm having a counterbalancing-weight, and the leg portion having a socket to receive the end portion of the roll; substantially as described.

5. A roll-removing apparatus comprising an overhung lever device, the lower portion of which is provided with a socket arranged to receive the end portion of the roll, the upper portion having an

intermediate supporting device arranged vertically over the central portion of the roll when in the apparatus; substantially as described.

6. A roll-removing device comprising an overhung lever having a socket in its lower portion arranged to receive the end portion of a roll, and a suspending device connected to the upper lever-arm at a point outside the socket, whereby said suspending device will be over the intermediate part of the roll when engaged; substantially as described.

808,720. BOW-FACING OAR. FRANK L. BUFF, Baton, Ill. Filed May 3, 1905. Serial No. 258,945.



Claim.—1. In a device of the class described, the combination with a supporting-bracket, of a base mounted to tilt vertically thereon and provided with a pair of spaced openings, drums having hubs disposed concentrically with the respective openings and provided with pendent spindles rotatably passing through said openings, peripheral flanges pendent from the hubs and working upon the base-plate, the spaces between the hubs and the base-plate constituting oil-reservoirs, retaining-heads detachably carried by the lower ends of the spindles, means connecting the two drums for simultaneous movement in opposite directions, and means for connecting a handle-section and a blade-section to the respective drums

2. In a device of the class described, the combination with a supporting-bracket, of a base-plate mounted to tilt vertically thereon and provided with a pair of spaced openings, a pair of drums having hubs disposed concentrically with respect to the openings and provided with pendent peripheral flanges working upon the base-plate, spindles pendent from the hub and rotatably passing through the openings, retaining-heads detachably carried by the lower ends of the spindles, the annular spaces between the hubs and the base-plate constituting oil-chambers, posts rising centrally from the hubs, a tie-bar connecting the upper ends of the posts, and means for connecting a handle-section and a blade-section to the respective drums.

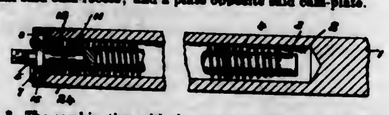
808,721. NON-SKIDDING DEVICE FOR TIRES. CHARLES R. DOLLARD, St. Ives, county of Huntingdon, England. Filed July 6, 1905. Serial No. 268,688.

Claim.—In combination, a tire, a continuous strip comprising a plurality of straight portions at each side of the tread of the tire, connected by angular portions; and separate bars arranged parallel with the straight portions at one side of the tread of the tire.

808,722. SHADE-ROLLER. LOUIS T. DUSSAT, New Haven, Conn. Filed Dec. 10, 1904. Serial No. 236,709.

Claim.—1. In a shade-roller, the combination with a roller; of a spring-bar mounted therein; a spear-bar fixed to said spring-bar and having a notched collar thereon; a cam-plate fixed to the end of said roller, said cam-plate having a substantially L-shaped cam-recess therein; a ball operative therein; and means, as a plate, for preventing the accidental displacement of said ball.

2. In a shade-roller, the combination with a roller; of a spring-bar mounted therein; a spear-bar fixed within the end of said spring-bar and having a collar thereon provided with a notch having parallel sides and a recess in the periphery thereof; a cam-plate, having a substantially L-shaped cam-recess therein; a ball movably mounted within said cam-recess; and a plate opposite said cam-plate.



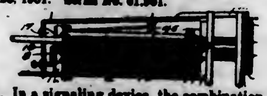
3. The combination with the spear-bar, having a collar thereon provided with a radial notch and a peripheral recess adjacent to said notch; of a cam-plate, having a substantially L-shaped cam depression therein, said cam depression being rounded at both ends and having sides concentric with each other; a ball within said cam depression of substantially the same diameter as the width thereof; and a plate opposite said cam-plate.

4. The combination with a spear-bar 5, having the collar 7 thereon provided with a notch having parallel sides and a peripheral recess adjacent to said notch; a cam-plate 13, having a substantially L-shaped cam depression 15 therein; a ball 16 operative within said depression; and a plate 19 opposite said cam-plate.

5. In a shade-roller, the combination with a roller; of a spring-bar mounted therein; a spear-bar fixed within the end of said spring-bar and having a collar thereon provided with a notch in the periphery thereof; a cam-plate having a cam-recess therein, which during its rotation passes the bottom of the recess in said collar; a ball within said cam-recess; and a plate opposite said cam-plate.

6. In a shade-roller, the combination with a roller; of a spring-bar mounted therein; a spear-bar fixed within the end of said spring-bar and having a collar thereon provided with a parallel-sided notch in the periphery thereof; a cam-plate upon one side of said collar having a cam-recess therein, which during a portion of its rotation registers with the recess in said collar; a ball within said cam-recess; and a plate upon the side of said collar opposite said cam-plate.

808,723. ANNUNCIATOR. ALBERT CARLES, Chicago, Ill., assignor to American Electric Telephone Company, Chicago, Ill., a Corporation. Filed May 26, 1901. Serial No. 61,961.



Claim.—1. In a signaling device, the combination with a magnet having a coil, insulating-supports at each end of the coil, a core therefor, end pieces affixed to said core, an armature extending longitudinally of the coil and coöperating with the end pieces, electrical contacts carried by said insulating-supports, one of said contacts being of spring material to return the armature to normal position, means to close the said contacts in the initial movement of the armature, and a signal-indicating device operated by said armature in its forward movement together with indicating means normally concealed or covered by said device.

2. In an annunciator, the combination with a magnet of a core and end pieces therefor, insulating-blocks between the end pieces and the coil, longitudinal stripe secured to said insulating-pieces, stationary contact on one strip, a spring-contact on the other strip and adapted to coöperate with the stationary contact, an armature extending longitudinally of the coil pivoted at one end and adapted to be retracted by said spring-contact, and a signaling device operated by said armature together with indicating means normally concealed or covered by said device.

3. In a magnet, an armature, a supporting-plate therefor, another plate having integral rivets formed thereon by which said supporting-plate is secured thereto.

4. In an annunciator, a front supporting-plate, a shutter or drop pivoted to said plate, said plate having apertures so located as to be closed by the drop or shutter beneath the drop or shutter, and an indicating-plate having lugs on its rear face to fit within said apertures and secure the same in place.

5. In an annunciator, the combination with a drop or shutter, of a pintle or pivot-pin therefor having a central upward bend, and a lever to actuate said drop or shutter and extending beneath said upward bend.

6. In an annunciator, the combination of a magnet-core having a relatively flat pole-piece disposed in the plane of one end and having its other end extended, an armature mounted upon the extended end of the core and having its free end overlying the pole-piece, normally open circuit-closing contacts underlying said armature and adapted to be operated thereby, one of said contacts consisting of a spring tending to keep the armature normally raised, and a shutter normally in a vertical position and in operative relation to said armature.

7. In an annunciator, the combination of a magnet-core having a relatively flat pole-piece disposed in the plane of one end, an armature mounted at the other end of the magnet and overlying the pole-piece, normally open circuit-closing contacts underlying the armature, one of said contacts consisting of a spring tending to keep the armature normally raised, and a shutter hung in a suitable support secured to the forward end of the magnet, said shutter being normally in a vertical position and having a finger or projection underlying the free end of the armature.

8. The combination of an electromagnet, an armature-mounting secured to the rear end of the magnet, a swinging armature mounted on said mounting and extending over and to the forward end of the magnet, a pair of terminal stripe mounted at either side of said armature, said terminal stripe being rigidly connected by blocks of insulation secured to the opposite ends of the electromagnet, normally open circuit-closing contacts carried by said terminal stripe, one of said contacts consisting of a spring tending to keep the armature normally raised, and a normally vertical shutter hung on the forward end of the magnet structure and operated by said armature.

9. The combination of an electromagnet, flat pole-pieces secured to the opposite ends of said magnet, an armature-mounting secured to the rear end of the magnet, an armature pivotally mounted on said mounting and overlying both pole-pieces, a normally vertical shutter hung on the forward end of the magnet structure and adapted to be raised to a horizontal position by the downward movement of the armature, and a spring-switch tending to keep the armature normally raised and the shutter in its vertical position.

10. In an annunciator, the combination of an electromagnet, pieces of insulation secured to the opposite ends of said magnet, pole-pieces also secured to opposite ends of said magnet, parallel terminal stripe secured to said pieces of insulation at opposite sides of the magnet, an armature pivotally mounted upon one end of the magnet structure, the said armature overlying both pole-pieces, a vertical indicator hung at the other end of the magnet structure and operated by the armature, and switch-contacts carried by said terminal stripe and adapted to be opened and closed by the armature.

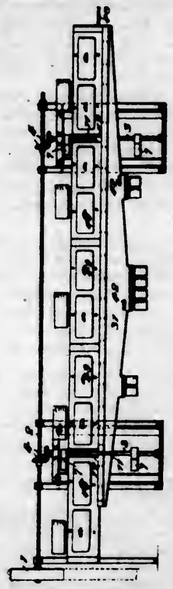
11. An annunciator, comprising a magnetic core having a relatively flat pole-piece disposed in the plane of one end and having its other end extended, an armature provided with a rear vertical portion suitably mounted on the extended rear end of the core and having its horizontal portion overlying the pole-piece, a finger on the forward end of the armature, a spring tending normally to keep the armature raised, and a target hung on the forward end of the magnet structure and held in a normally lowered position, said target having a rearwardly-extending projection underlying the said finger, whereby said target is raised when the armature is attracted together with indicating means normally concealed or covered by said target.

12. An annunciator comprising a magnetic core having a relatively flat pole-piece disposed in the plane of one end, an armature provided with a rear vertical portion suitably mounted at the other end of the magnet and having its horizontal portion overlying the pole-piece, the forward end of said armature being provided with a finger, a target hung from the forward end of the magnet structure, and a spring-switch tending normally to keep the armature raised, said target being normally down and having a rear projection underlying the said finger, whereby the target is raised when the armature is attracted together with indicating means normally concealed or covered by said target.

13. An annunciator, comprising an electromagnet, pieces of insulation secured to the opposite ends of said magnet, pole-pieces also secured to the opposite ends of said magnet, an armature mounted upon the rear end of the magnet structure and having its horizontal portion overlying both pole-pieces, parallel terminal stripe rigidly secured to said pieces of insulation at opposite sides of the magnet, a shutter carried by the forward end of the magnet structure and operated by said armature, and switch-contacts carried by said terminal stripe beneath the armature and operated by the latter together with indicating means normally concealed or covered by said target.

14. An annunciator comprising an electromagnet, pieces of insulation secured to opposite ends of said magnet, an armature suitably mounted upon the rear end of the magnet structure and having its horizontal portion overlying the magnet, a shutter engaged and operated by the forward end of the armature, terminal stripe secured to said pieces of insulation at opposite sides of the magnet, and switch-contacts carried by the said terminal stripe beneath the armature and opened and closed by the latter together with indicating means normally concealed or covered by said target.

808,724. BOLTING-MACHINE. JOHN M. CASE, Cincinnati, Ohio. Filed Mar. 21, 1903. Serial No. 148,945.



Claim.—1. The combination with a series of bolts arranged end to end in a single gyratory structure, of a conveyer disposed beneath and movable with the bolts, having its bottom inclined from the ends toward the center and comprising a plurality of parallel rows of troughs having their tops in the same horizontal plane, the length of the troughs in any one row differing from the length of the troughs in any other row.

2. A bolting-machine comprising a series of complete bolts arranged end to end and in a horizontal line in a single gyratory structure and each bolt having a plurality of sieves arranged one above the other and inclined longitudinally of the structure; and a series of transverse pockets between adjacent ends of adjacent bolts, each sieve of each bolt opening into one of the pockets of the series, and troughs common to the pockets of a plurality of bolts.

3. A bolting-machine comprising a series of complete bolts arranged end to end and in a horizontal line in a single gyratory structure and each bolt having a plurality of sieves arranged one above the other and inclined longitudinally of the structure; and a series of transverse pockets between adjacent ends of adjacent bolts, each sieve of each bolt opening into one of the pockets of the series, and a conveyer movable with the structure having a plurality of troughs common to a plurality of different bolts.

4. A bolting-machine comprising a series of complete bolts arranged end to end and in a horizontal line in a single gyratory structure and each bolt having a plurality of sieves arranged one above the other, a series of pockets transverse of the structure between adjacent ends of adjacent bolts, each sieve of each bolt delivering one of its products into one of the pockets, and each pocket having an opening to the exterior of the bolt structure to provide a discharge, and a plurality of troughs common to a plurality of the pocket discharge-openings.

5. A bolting-machine comprising a series of complete bolts arranged in a horizontal line in a single gyratory structure and having a plurality of sieves arranged one above the other, a series of pockets transverse of the structure separating adjacent bolts, each sieve of each bolt delivering one of its products into one of the pockets, and each pocket having an opening to the exterior of the bolt structure

to provide a discharge, and a plurality of troughs common to a plurality of pocket discharge-openings and having discharges for the material received, some of said troughs having a plurality of said discharge-openings some of which are connected with the discharge-opening of other troughs.

6. A bolting-machine comprising a gyratory structure, a plurality of complete bolts arranged in said structure end to end and in a horizontal line, unconnected with one another within said structure and having a plurality of sieves, separate intakes for each bolt for material from without the structure, and a plurality of series of vertical pockets extending transversely of the structure and between adjacent ends of adjacent bolts, and each pocket receiving one of the products of one of the sieves of one bolt and having a discharge-opening in its bottom.

7. In a bolting-machine, the combination with a single gyratory structure, and a plurality of bolts unconnected with one another within said structure, having separate intakes for each bolt for material from without the structure, and a plurality of discharge-openings from each bolt, of a conveyer movable with the bolt structure, inclined downwardly from its ends to its center and divided into a plurality of troughs some of which are common to a plurality of bolts.

8. In a bolting-machine, the combination with a single gyratory structure, and a plurality of bolts unconnected with one another within said structure, having separate intakes for each bolt for material from without the structure, and a plurality of discharge-openings from each bolt, of a conveyer movable with the bolt structure, and divided into a plurality of troughs one of which is common to all the bolts, and the others being common to various numbers of the bolts.

9. In a bolting-machine, the combination with a single gyratory structure, and a plurality of bolts unconnected with one another within said structure, having separate intakes for each bolt for material from without the structure, and a plurality of discharge-openings from each bolt, of a plurality of conveyers movable with the bolt structure, having discharge-openings, and means on the conveyer for connecting the discharge of one of the troughs with the discharge of another of the troughs.

10. In a bolting-machine, the combination with a plurality of bolts unconnected with one another and each having a plurality of discharge-openings, of means for collecting and separately discharging material separated by the several bolts which consists of the series of longitudinal conveyer-troughs extending beneath all of the bolts, receiving all the material from all the bolts and made up of a box sloping from the ends to the center and having longitudinal partitions and transverse partitions inserted at suitable points in the respective troughs to confine the material and permit the use of one conveyer for a plurality of grades of material.

11. In a bolting-machine, the combination with a plurality of bolts unconnected with one another and each having a plurality of discharge-openings, of means for collecting and separately discharging material separated by the several bolts which consists of the series of longitudinal conveyer-troughs extending beneath all of the bolts, receiving all the material from all the bolts and made up of a box having longitudinal partitions and transverse partitions inserted at suitable points in the respective troughs to confine the material and permit the use of one conveyer for a plurality of grades of material, discharge-openings being provided for the respective compartments thus formed, and a transverse discharge-trough being arranged beneath each discharge-opening.

12. In a bolting-machine, the combination with a plurality of bolts unconnected with one another and each having a plurality of discharge-openings, of means for collecting and separately discharging material separated by the several bolts which consists of the series of longitudinal conveyer-troughs extending beneath all of the bolts, receiving all the material from all the bolts and made up of a box having longitudinal partitions and transverse partitions inserted at suitable points in the respective troughs to confine the material and permit the use of one conveyer for a plurality of grades of material, discharge-openings being provided for the respective compartments thus formed, and a transverse discharge-trough arranged beneath each discharge-opening; some of said compartments having a plurality of discharge-openings and valves for determining through which of said discharge-openings the material shall pass.

13. In a horizontal bolting-machine, suitably mounted for oscillating or gyratory action, means for imparting motion, consisting of an eccentric having means for rotating it, a box in which said eccentric works, connected to the bolt by means of clamping-plates on opposite sides of the bolting-machine, securing-bolts passed through said plates and holding them together whereby the structure is sustained in addition to being rigidly connected with the driving parts brackets carried by the clamping-plates, on one side of the bolting-machine, and a standard suitably stopped at its lower end and supporting the bolt by its connection with said bracket

---

808,725. LIGHTER. ALBERT B. CAPERNY, Omaha, Nebr., assignor of one-half to John Preuss and Seth W. Creal, Council Bluffs, Iowa. Filed Aug. 1, 1905. Serial No. 272,231.

Claim.—1. In a lighter of the class described, the combination of a magazine for holding ignitible charges, a percussor or igniter for igniting charges fed from the magazine, feeding means separate from the percussor for feeding charges from the magazine thereof, and means connected with the percussor and the feeding mechanism for positive simultaneous actuation thereof.

2. In a lighter of the class described, the combination of a magazine adapted to receive ignitible charges, a percussor, a feeding member adapted to feed charges from the magazine to the percussor, and a lever operably connected with the feeding member and the percussor for actuation thereof.

3. In a lighter of the class described, the combination of a magazine adapted to receive ignitible charges, a feeding-chamber, a flame-chamber, a percussor separating the flame-chamber from the feeding-chamber, a flame-opening for the flame-chamber, a wick at the mouth of said opening, feeding mechanism in the feeding-chamber adapted to feed charges from the magazine to the percussor, and means for actuating the feeding mechanism and the percussor.

4. In a lighter of the class described, the combination of a magazine adapted to receive ignitible charges, a feeding-chamber, a flame-chamber, a percussor separating the flame-chamber from the feeding-chamber, a flame-opening for the flame-chamber, a wick at the mouth of said opening, feeding mechanism in the feeding-chamber adapted to feed charges from the magazine to the percussor, a percussion-plate in the flame-chamber coacting with the percussor, a lever operably connected with the percussor and the feeding mechanism aforesaid, and means for actuating said lever.

5. In a lighter of the class described, the combination of a magazine adapted to receive ignitible charges, a pivoted percussor, a feeding member for feeding charges from the magazine to the percussor comprising a lever, spaced feeding-fingers carried by the lever to engage a charge received from the magazine, and an operating-lever connected with the feeding member and with the pivoted percussor for actuating the same.

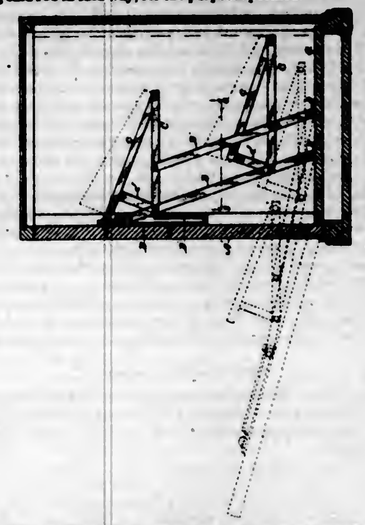
6. In a lighter of the class described, the combination of a magazine adapted to receive ignitible charges, a pivoted percussor, a feeding member for feeding charges from the magazine to the percussor comprising a lever, spaced feeding-fingers carried by the lever to engage a charge received from the magazine, a percussion-plate coacting with the percussor, a spring-actuated lever, connections between the spring-actuated lever and the feeding member and percussor for simultaneously actuating the feeding member and percussor, and a finger-piece operably connected with the spring-actuated lever, as specified.

808,726. SHOW OR DISPLAY CASE. GEORGE H. CLAPP, Kalamazoo, Mich. Filed Jan. 13, 1904. Serial No. 189,063.

Claim.—1. The combination of a suitable casing; an outwardly and downwardly opening door therefor; a removable bottom for said casing; supporting-standards arranged in pairs pivotally secured to said removable bottom; tray or shelf supports pivotally secured to said standards in a manner to permit the same being collapsed; forwardly-inclined tray-rests on said tray-supports; a rod carried by the rear pair of standards; a bracket having a way therein adapted to receive said rod secured to said door; and a latch for retaining said rod in said way, for the purpose specified.

2. The combination of a suitable casing; an outwardly and downwardly opening door therefor; a removable bottom for said casing; supporting-standards arranged in pairs pivotally secured to said removable bottom; tray or shelf supports pivotally secured to said standards in a manner to permit the same being collapsed; forwardly-inclined tray-rests on said tray-supports; a rod carried by the rear pair of standards; and a bracket having a way therein adapted to receive said rod secured to said door; for the purpose specified.

adapted to receive said rod secured to said door; and a latch for retaining said rod in said way, for the purpose specified.



3. The combination of a suitable casing; an outwardly and downwardly opening door therefor; a removable bottom for said casing; supporting-standards arranged in pairs pivotally secured to said removable bottom; tray or shelf supports pivotally secured to said standards in a manner to permit the same being collapsed; forwardly-inclined tray-rests on said tray-supports; a rod carried by the rear pair of standards; a bracket having a way therein adapted to receive said rod, secured to said door; for the purpose specified.

4. The combination of a suitable casing; an outwardly and downwardly opening door therefor; a removable bottom for said casing; supporting-standards arranged in pairs pivotally secured to said removable bottom; tray or shelf supports pivotally secured to said standards in a manner to permit the same being collapsed; a rod carried by the rear pair of standards; and a bracket having a way therein adapted to receive said rod secured to said door, for the purpose specified.

5. The combination of a suitable casing; an outwardly and downwardly opening door therefor; a removable bottom for said casing; supporting-standards arranged in pairs pivotally secured to said removable bottom; tray or shelf supports pivotally secured to said standards in a manner to permit the same being collapsed; forwardly-inclined tray-rests on said tray-supports; and a connection for said standards to said door, for the purpose specified.

6. The combination of a suitable casing; an outwardly and downwardly opening door therefor; a removable bottom for said casing; supporting-standards arranged in pairs pivotallysecured to said removable bottom; tray or shelf supports pivotally secured to said standards in a manner to permit the same being collapsed; and a connection for said standards to said door, for the purpose specified.

7. The combination of a suitable casing; an outwardly and downwardly opening door therefor; a removable bottom for said casing; supporting-standards arranged in pairs pivotally secured to said removable bottom; tray or shelf supports pivotally secured to said standards in a manner to permit the same being collapsed; and forwardly-inclined tray-rests on said tray-supports, for the purpose specified.

8. The combination of a suitable casing; an outwardly and downwardly opening door therefor; a removable bottom for said casing; supporting-standards arranged in pairs pivotally secured to said removable bottom; tray or shelf supports pivotally secured to said standards in a manner to permit the same being collapsed, for the purpose specified.

9. The combination of a suitable casing; an outwardly and downwardly opening door therefor; supporting-standards arranged in pairs supported in said casing; tray or shelf supports pivotally secured to said standards in a manner to permit the same being collapsed; forwardly-inclined tray-rests on said tray-supports; and a connection for said standards to said door, for the purpose specified.

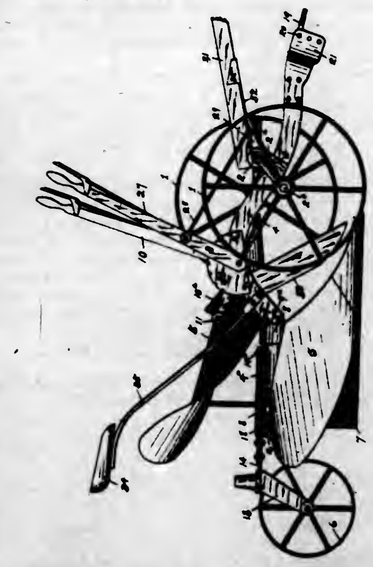
10. The combination of a suitable casing; an outwardly and downwardly opening door therefor; supporting-standards arranged in pairs supported in said casing; tray or shelf supports pivotally secured to said standards in a manner to permit the same being collapsed; and forwardly-inclined tray-rests on said tray-supports, for the purpose specified.

11. The combination of a suitable casing; an outwardly and downwardly opening door therefor; standards pivotally supported in said casing; tray or shelf supports pivotally secured to said standards; forwardly-inclined tray-rests on said tray-supports; and a suitable connection for said standards to said door, for the purpose specified.

12. The combination of a suitable casing; an outwardly and downwardly opening door therefor; standards pivotally supported in said casing; tray or shelf supports pivotally secured to said standards; and forwardly-inclined tray-rests on said tray-supports, for the purpose specified.

13. The combination of a suitable casing; standards arranged in pairs pivotally supported in said casing; tray or shelf supports pivotally secured to said standards in a manner to permit the same being collapsed; and forwardly-inclined tray-rests on said tray-supports, for the purpose specified.

808,727. PLOW. WALTER CONNOR, Toledo, Ohio. Filed Mar. 13, 1905. Serial No. 249,963.



Claim.—1. In a plow, a beam, forward supporting-wheels and a caster-wheel for said beam, a pair of plows movably carried by said beam, means for moving either of the plows to operative position, and means for causing the caster-wheel to be automatically moved to the right or left as the plows are moved whereby it may follow in the furrow of the operative plow.

2. In a plow, a beam, forward and rear supporting-wheels therefor, a pair of connected plows carried in spaced position by said beam, means for adjusting the plows to turn a right or left furrow-slice, and means for causing a lateral movement of the rear supporting-wheel when the plows are adjusted whereby it is caused to follow the operative plow.

3. The combination with the beam of a tricycle-plow, of a pair of rigidly-spaced adjustable plows adapted to be moved to turn a right or left furrow-slice, a caster-wheel for supporting the rear end of said beam, and means operative by the adjustment of the plows for causing the caster-wheel to be moved laterally to follow the operative plow.

4. The combination with the beam of a plow, and a pair of connected plows movably carried thereby to permit of their adjustment to turn a right or left furrow-slice, of a caster-wheel having an arm

pivotally connected to the beam, and means operative by the adjusting of the plows for causing said caster-wheel to be moved to the right or left to travel in the furrow of the operative plow.

5. The combination with the beam of a wheeled plow, of a pair of rigidly-connected plows having their landsides disposed in different planes and mounted to turn on said beam, a caster-wheel having its fork provided with an arm the free end of which is pivoted to a portion of the beam, means on said arm having engagement with a portion of said beam adapted to permit a lateral movement and prevent a vertical movement of the caster-wheel independent of the beam, and means on said arm having connection with the connection between the plows and adapted to cause the caster-wheel to swing in the direction the plows are turned when adjusted.

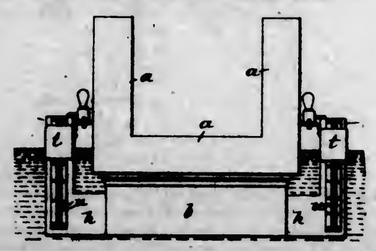
6. In a plow, a beam, two plows movably carried by said beam, a clevis secured to and movable transversely of the end of the beam, a bell-cranked lever pivoted to the beam and having one arm in engagement with the clevis, whereby a movement of the lever imparts a movement to the clevis, means for moving either plow into operative position, and connection between said lever and means for imparting an oscillatory movement to the lever as the means is moved to adjust the plows.

7. In a plow, a beam, two plows adjustably carried by said beam, a clevis secured to and movable transversely of the beam, a bell-cranked lever pivoted to said beam and having connection with the clevis, an operating-lever having connection with and adapted to move either plow into operative position, connection between the bell-cranked lever and operating-lever whereby a movement of the operating-lever imparts a movement to the bell-cranked lever and clevis, and means for adjusting the connection between the levers to regulate the throw of the clevis.

8. The combination in a plow, of a beam, a plurality of plows, adjustably carried by the beam, a caster-wheel for supporting the rear end of said beam and adjustable to the right or left thereof by the adjustment of the plows, a lever for adjusting the plows, and a clevis movable by said lever to change the draft-line to suit the adjusted position of the plows.

9. In a plow, a beam, a laterally-adjustable caster-wheel for supporting the rear end of said beam, two rigidly-connected plows mounted to rotate on said beam and having connection with the caster-wheel adapted to cause it to move laterally to follow the operative plow when the plows are turned, an operating-lever having connection with the plows for imparting rotation thereto, and means movable by said lever for causing the draft-line of the machine to be changed to cause the plows when adjusted to each take the same width of furrow-slice.

808,728. FLOATING CAISSON. ANDREW C. CUNNINGHAM, Washington, D. C. Filed Sept. 20, 1905. Serial No. 279,247.



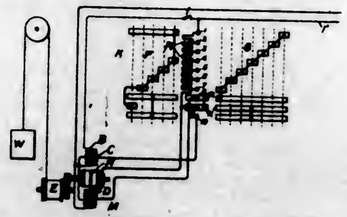
Claim.—1. An under-water floating caisson for the purposes described, comprising an open-topped working chamber having a bottom and closed on all sides, said chamber being adapted to be entirely submerged and to be floated under the structure to be repaired, means for gaining access to the chamber from above the water after it is in place and for exhausting the water therefrom, and floats exterior to the chamber for suspending or maintaining it at the desired depth of submergence while being moved into place; substantially as described.

2. An under-water floating caisson for the purposes described, comprising an open-topped working chamber having a bottom and closed on all sides, said chamber being adapted to be entirely submerged and to be floated under the structure to be repaired, means for gaining access to the chamber from above the water after it is in place and for exhausting the water therefrom, and floats exterior to the chamber for suspending or maintaining it at the desired depth of submergence while being moved into place, said floats being vertically adjustable with respect to the chamber; substantially as described.

3. An under-water floating caisson for the purposes described, comprising an open-topped working chamber having a bottom and closed on all sides, said chamber being adapted to be entirely submerged and to be floated under the structure to be repaired, means for gaining access to the chamber from above the water after it is in place and for exhausting the water therefrom, and floats exterior to the chamber for suspending or maintaining it at the desired depth of submergence while being moved into place, said floats being vertically adjustable with respect to the chamber by worm and rack gear; substantially as described.

4. An under-water floating caisson for the purposes described, comprising an open-topped working chamber having a bottom and closed on all sides, said chamber being adapted to be entirely submerged and to be floated under the structure to be repaired, means for gaining access to the chamber from above the water after it is in place and for exhausting the water therefrom, and floats exterior to the chamber for suspending or maintaining it at the desired depth of submergence while being moved into place, said floats being connected to opposite ends of the chamber; substantially as described.

808,729. SYSTEM OF CONTROL FOR ELECTRIC MOTORS. MAXWELL W. DAY, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed May 15, 1905. Serial No. 260,627.



Claim.—1. In a system of control, a motor having a shunt field-winding and a plurality of series field-windings, and means for connecting said motor to a source of current-supply in such a manner that the effective excitation of the series windings assists that of the shunt-winding both when the motor is propelling a load and when it is overhauled by the load and acting as a generator.

2. In a system of control, a motor having a shunt field-winding and a plurality of series field-windings, means for connecting said motor to a source of supply in such a manner that the motor will run in one direction and the field-windings will assist each other and the shunt-winding in exciting the field, and means for connecting the motor for operation in the reverse direction in such a manner that the effective excitation of the series windings is cumulative to that of the shunt-winding both when the motor is operating as a motor and when it is overhauled by the load and made to operate as a generator.

3. In a system of motor control, a motor having a shunt field-winding and a plurality of series field-windings, means for connecting the motor to a source of current-supply in such a manner that the shunt and series windings assist each other, and means for connecting the motor for operation in the reverse direction in such a manner that the currents flowing through the series windings are unequal and have opposing effects which in the aggregate assist the shunt-winding, the arrangement being such that when the load overhauls the motor and causes it to run as a generator the aggregate effect of the series windings is cumulative to that of the shunt-winding.

4. In a system of control, a motor having a plurality of series windings, means for connecting the motor to a source of current-supply so that the said field-windings assist each other when the motor runs in one direction, and means for connecting said motor for operation in the reverse direction in such a manner that the field-windings oppose each other when the motor is acting as a motor and assist each other when the motor is overhauled by the load and is acting as a generator.

5. In a system of control, a motor having a shunt field-winding and a plurality of series field-windings, means for connecting the motor to a source of current-supply so that the said series field-windings assist each other and the shunt-winding when the motor is operated in one direction, and means for connecting said motor for

operation in the reverse direction in such a manner that the series field-windings oppose each other when the motor is acting as a motor and assist each other and the shunt-winding when the motor is overhauled by the load and acts as a generator.

6. In a system of control, a motor having a shunt field-winding and a plurality of series field-windings, means for connecting the motor to a source of current-supply so that the series windings assist said shunt-winding when the motor runs in one direction, and means for connecting a portion of said series field-windings to the source of current-supply and short-circuiting the motor-armature through the remainder of the series windings when the motor is connected for operation in the reverse direction, whereby the shunt-winding is assisted by one or more of the series windings both when the motor is acting as a motor and when it is overhauled by the load and acts as a generator.

7. In a system of motor control, a motor having a shunt field-winding and a plurality of series field-windings, means for connecting said motor to a source of current-supply for rotation in one direction in such a manner that the series field-windings assist each other and the shunt-winding, and means for connecting the motor for rotation in the opposite direction in such a manner that the relative effects of the windings are changed.

8. In a system of control, a motor having a plurality of field-windings, and a controller having contacts constructed and arranged to connect said motor to a source of current-supply with the field-windings arranged in series with each other and with the armature, the contacts being also constructed and arranged to connect a portion of said field-windings as a shunt-winding and short-circuit the armature through the remaining portion of the field-windings.

9. In a system of control, a motor having a plurality of field-windings, a resistance, and a controller having contacts and connections constructed and arranged to connect said motor to a source of current-supply so that the field-windings are in series with each other and with the armature when the motor runs in one direction, or so that the motor tends to run in the opposite direction and the armature is short-circuited through a portion of the windings while the other portion is connected with the source of current-supply through the resistance.

10. In a system of control, a motor having a shunt field-winding and a plurality of series field-windings, and a controller having contacts and connections arranged to connect said motor to a source of current-supply for rotation in one direction, said controller also having contacts constructed and arranged to connect the motor for rotation in the opposite direction with one of its series windings connected to the source of current-supply and with the armature short-circuited through the remainder of the series windings.

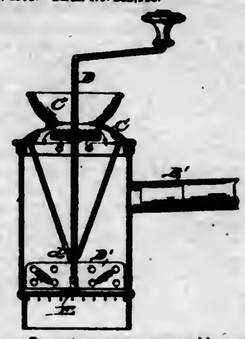
11. In a system of control, a motor having a plurality of field-windings, a resistance, and a controller having contacts and connections constructed and arranged to connect said motor to a source of current-supply so that the field-windings are in series with each other and with the armature when the motor runs in one direction, and also having contacts arranged to connect a portion of said series windings to the source of current-supply in series with said resistance and to connect the armature and the remainder of the field-windings in shunt with a portion of said resistance.

12. In a system of control, a motor having a plurality of series field-windings and a shunt field-winding, a resistance, and a controller for connecting said motor to a source of current-supply with the armature in series with the series winding and in parallel with the shunt-winding for rotation in one direction, said controller having contacts constructed and arranged to connect the motor for rotation in the opposite direction with a portion of the series windings connected to the source of supply in series with the resistance and the motor-armature and the remainder of the series windings connected in shunt to variable portions of said resistance.

13. In a system of control, a motor having two field-windings, a resistance, and a controller having contacts constructed and arranged to connect said motor to a source of current-supply with the field-windings in series with the armature, said contacts being also constructed and arranged to connect one of said field-windings to the source of current-supply in series with the resistance and to short-circuit the armature through the other field-winding in one position of the controller and to connect the armature and the latter field-winding in shunt with successively-varying portions of said resistance in subsequent positions of the controller.

14. In a system of control, a motor having a shunt field-winding and two series field-windings, a resistance, and a controller having contacts and connections constructed and arranged to connect said motor to a source of current-supply with the armature and series field-windings in series with each other and in parallel with the shunt field-winding, said controller also having contacts arranged to connect said motor to a source of current-supply with one series winding in series with the resistance and in parallel with the shunt-winding and the armature short-circuited through the other series winding in one position of the controller and with the armature and said latter field-winding shunted across varying portions of said resistance in subsequent positions of the controller.

808,730. COFFEE-POT. MARTIN M. DE GROOT, St. Louis, Mo. Filed Mar. 27, 1905. Serial No. 252,118.



Claim.—In a coffee-pot, an upper removable section, a screen located within and adjacent to its lower edge, a removable cover provided with a funnel having a plurality of contracted openings discharging into said upper section, and stirring-blades located within said upper section and supported from said removable cover, said stirring-blades operated by a suitable crank-arm, substantially as described.

808,731. CLAMP. PATRICK F. DENNING, Newark, N. J. Filed Oct. 18, 1904. Serial No. 229,000.

Claim.—1. A clamp of the class described, having a movable spring-controlled clamping-jaw for yieldably engaging the object to be held, and independently-movable gripping mechanism carried by the clamping-jaw and arranged to clamp the article against the said jaw.

2. A clamp of the class described, provided with a movable clamping-jaw arranged to engage the article to be held, and gripping mechanism movably mounted on and carried by the clamping-jaw and also arranged to clamp the article independently of and simultaneously with the clamping of the same by the said jaw.

3. A clamp of the class described provided with a movable clamping-jaw having an opening and adapted to engage the article to be held, and a gripping device operating within the opening of the jaw and carried by the latter and arranged to clamp the article against the said jaw.

4. A clamp of the class described, provided with a clamping-jaw arranged to engage the article to be held, said clamping-jaw having an opening, and a hinged dog mounted within the opening of the jaw and arranged to grip a portion of the article and clamp the same against the jaw.

5. A clamp of the class described, having a clamping-jaw provided at its engaging portion with a loop, a dog operating within the loop and carried by the same and arranged to clamp an article against the said jaw, and means for limiting the movement of the dog.

6. A clamp of the class described, having a clamping-jaw provided with a loop, said loop being bifurcated and having eyes at opposite sides of the bifurcation, a movable dog arranged within the loop and having an eye, a lug carried by the dog and movable into and out of engagement with the loop, and a pivot passing through the said eyes and hinging the dog to the jaw, the forward movement of the said dog being limited by the said lug.

7. A clamp of the class described, comprising a casing open at

opposite ends and provided with a pivot, a pair of clamping-jaws mounted on the pivot and extending from the open ends of the casing, and a spring mounted on the pivot and engaging each of the jaws for holding the same in their engaging positions.

8. A clamp of the class described, comprising a casing open at opposite ends and having a pivot, jaws extending from the open ends of the casing and having shanks extending into the same, said shanks being provided at opposite sides with eyes, one of the shanks being extended beyond one of the eyes and provided at its extended portion with a lug, and a spring mounted on the pivot and having an intermediate portion engaging the lug of one of the shanks, and the ends of the spring being engaged with the other shank.

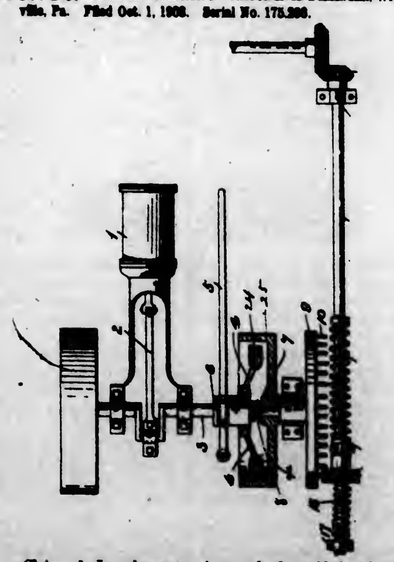
9. A clamp of the class described, comprising a casing having a housing and an attachment-plate, said casing being divided transversely and having interlocking portions, and movable jaws mounted on the casing and extending from the housing.

10. A clamp of the class described, comprising a casing composed of an attachment-plate and a housing, said casing being divided transversely to form two sections, one of the sections being provided with a flange extending into the other section, and movable jaws mounted within the casing and extending therefrom.

11. A clamp of the class described, comprising a movable jaw arranged to engage the article to be held, and a dog carried by the free portion of the jaw and operating within the same and arranged to engage a portion of the article clamped by the jaw.

12. A clamp of the class described, comprising a movable jaw arranged to engage the article to be held, and a dog carried by the free portion of the jaw and operating within the same and arranged to engage a portion of the article clamped by the jaw, said dog having its free end provided with teeth.

808,782. CHANGE-GEARING. CASTOR H. A. DEHNBOSTEL, Wrightsville, Pa. Filed Oct. 1, 1903. Serial No. 175,209.

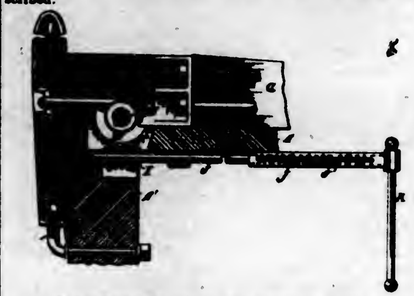


Claim.—1. In a change-gearing, a wheel provided with a series of concentric pins, an engine-shaft, a clutch-drum and clutch member on said shaft, said clutch-drum having connection with the pin-provided wheel, a pinion adapted to engage the pins, a lever for shifting the pinion, and springs to automatically throw the device out of operation when the lever is released.

2. In a change-gearing, a driving-shaft, a wheel provided with a series of concentric pins, a clutch to throw the same into or out of operation, a pinion to engage the pins, a shaft upon which the pinion is journaled, a lever for operating the pinion, and springs to throw the device out of operation when the lever is released.

808,783. POCKETKNIFE STANDARD. GEORGE W. DU BOIS, New Orleans, La. Filed Sept. 26, 1905. Serial No. 280,249.

Claim.—1. The combination with a car-body, of standard hinged on the sides of the same and provided with pivoted hooks adapted to extend inward, a rotary shaft arranged in bearings parallel to the side of the car and adapted for engagement with said hooks, gears fixed to said shaft, a transverse shaft having a worm which engages each gear and is adapted to rotate or lock the same, and means for rotating the transverse shaft, substantially as described.



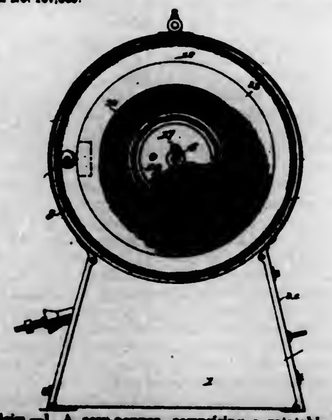
2. The combination with the car-body, of standards pivoted on the sides of the same, hooks hinged to the standards and adapted to extend inward therefrom, a shaft arranged parallel to the side edge of the car adjacent to the standards and provided with flattened portions with which the hooks are adapted to engage, a segmental gear keyed on the shaft, a worm engaging the segment, and a transverse shaft on which the worm is keyed, the same having a slidable extension provided with a handle, substantially as described.

3. The combination with a car-body, standards pivoted on the sides of the same, hooks pivoted to the standards and a shaft arranged along the edge of the car-body and provided with a gear, of means for operating and locking the latter consisting of a worm and a shaft on which the same is mounted, the shaft extending transversely beneath the car, a sliding tubular shaft applied to the worm-shaft, and a slidable handle applied to the outer end of the tubular extension, substantially as described.

4. The combination with a car-body of devices attached to the side thereof, and consisting of U-bolts having the curved central portion bent upward, standards mounted loosely on such curved portions, and means for locking and releasing the standards, substantially as described.

5. The combination with the car-body and standards therefor, of supports for the standards having curved portions arranged parallel to the side of the car, and the convex side of the curve being uppermost, and means for locking and releasing the standards, substantially as described.

808,784. CORN-POPPER. HERBERT W. HAKINS, Springfield, Ohio, assignor to Walter S. Long, Springfield, Ohio. Filed July 31, 1903. Serial No. 167,669.



Claim.—1. A corn-popper, comprising a rotatable popping-cylinder having a body composed of a relatively long outer portion consisting of a cylindrical screen of relatively fine mesh, a relatively short central portion consisting of a hollow drum closed at one end, open at the other end, and having an opening in its body-wall, and heads or ends converging inwardly from the outer cylinder to the inner drum, and an internal volute screen of relatively large mesh, connected with the outer cylinder at one end, extending around the central drum, and connected with said drum at a point adjacent to the opening in the body-wall thereof, substantially as described.

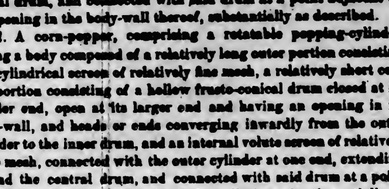
2. A corn-popper, comprising a rotatable popping-cylinder having a body composed of a relatively long outer portion consisting of a cylindrical screen of relatively fine mesh, a relatively short central portion consisting of a hollow fruste-conical drum closed at its smaller end, open at its larger end and having an opening in its body-wall, and heads or ends converging inwardly from the outer cylinder to the inner drum, and an internal volute screen of relatively large mesh, connected with the outer cylinder at one end, extending around the central drum, and connected with said drum at a point adjacent to the opening in the body-wall thereof, substantially as described.

3. A corn-popper, comprising a rotatable popping-cylinder having a body composed of a relatively long outer portion consisting of a cylindrical screen of relatively fine mesh provided with a peripheral opening, a relatively short central portion consisting of a hollow drum closed at one end, open at the other end, and having an opening in its body-wall, and heads or ends converging inwardly from the outer cylinder to the inner drum, and an internal volute screen of relatively large mesh, having one of its ends connected with the outer cylinder at the forward margin of the opening therein, said screen extending around the central drum and being connected therewith at a point adjacent to the rear margin of the opening in the body-wall thereof, substantially as described.

4. In a corn-popper, a popping-cylinder comprising heads and an outer cylindrical screen, an internal volute screen, and a trash-outlet frame or casing having a mouth or opening, said frame being provided with outer flanges extending in opposite directions from said mouth or opening to receive the ends of the outer screen, and said frame being also provided with an inwardly-extending portion provided with a flange to receive the outer end of the volute screen, substantially as described.

5. In a corn-popper, a popping-cylinder comprising heads and an outer cylindrical screen, an internal volute screen, and a trash-outlet frame or casing having a mouth or opening, said frame being provided with outer flanges extending in opposite directions from said mouth to receive the ends of the outer screen, said frame being also provided with an inwardly-extending portion to which is connected the outer end of the volute screen, said frame being further provided with lateral grooved flanges to fit over the margins of the heads, substantially as described.

808,785. METAL AXLE. EMIL BENFELDT, Davenport, Iowa, assignor to Bettendorf Metal Wheel Company, a Corporation of Iowa. Filed Nov. 9, 1904. Serial No. 232,055.



Claim.—1. A metal axle comprising a body portion and integral bearing-spindles, the body portion being composed of a web and flat longitudinal flanges, and the bearing-spindles being composed of a web of greater thickness and of less height than that of the body portion, and forming an integral continuation of the latter, and curved flanges forming integral continuations of the flat flanges of the body portion.

2. A metal axle consisting of a single section of commercial I-beam, comprising a main body portion and integral bearing-spindles, the body portion having flat flanges and a longitudinal connecting-web, and the bearing-spindles having a thickened web and inwardly-curved flanges with longitudinal spaces between the flanges and the web, and two bearing-shoulders at opposite sides of the bearing-spindle at its inner end, said shoulders being formed wholly of the metal of the flanges and presenting projections at two sides only of the spindle.

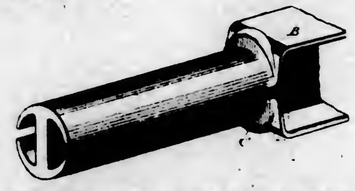
3. An axle embodying a section of I-beam having the web at the end of the section thickened, condensed and reduced in height, and the flanges at the end curved inward toward each other to present a rounded bearing-surface with longitudinal spaces between the curved curved flanges and the web.

4. An axle embodying a section of flanged bar having the flanges at the end curved to form a bearing-spindle, and integral shoulders at the inner end of the bearing-spindle, said shoulders being formed of the upset metal of the flanges.

5. A metal axle comprising a section of I-beam, with the web at the end condensed and thickened, and the ends of the flanges curved inward to form a bearing and spindle, and shoulders at the inner end of the spindle, consisting of the upset metal of the flanges

---

808,786. METHOD OF SHAPING METAL BARS. EMIL BENFELDT, Davenport, Iowa, assignor to Bettendorf Metal Wheel Company, a Corporation of Iowa. Original application filed Nov. 9, 1904, Serial No. 232,054. Divided and this application filed Mar. 17, 1905. Serial No. 250,949.

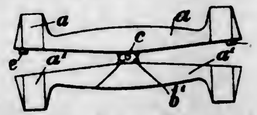


Claim.—1. The method of shaping flanged bars which consists in subjecting the bar to a lateral pressure to reduce its height locally, and rounding the flanges of the reduced portion.

2. The method of shaping flanged bars which consists in subjecting the same to lateral pressure at the end to reduce its height, rounding the flanges of the reduced portion of the bar, and subjecting the same to endwise pressure to form a shoulder.

3. The method of making metal axles which consists in selecting a bar having longitudinal flanges and a connecting-web, reducing the height of the web at the end of the bar and thereby increasing the thickness of said web, and bending the flanges of the thickened portion of the web inward to form a rounded surface and to leave longitudinal spaces between the web and the bent flanges.

808,787. HANDLE OR GRIP OF DUMB-BELLS OR OTHER EXERCISING APPARATUS. HENRY FARNBOTHER, London, England. Filed Mar. 31, 1905. Serial No. 253,130.



Claim.—1. A grip formed in sections pivoted together centrally, and buffers near the ends of certain of the sections.

2. A grip comprising a body-section provided with ears, and sections pivoted to the ears of the body-section, buffers near the ends of the pivoted sections to contact with the body-section.

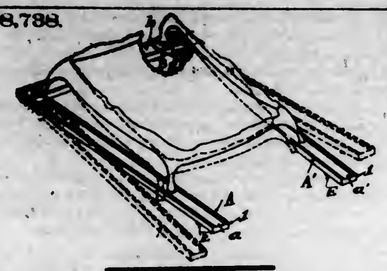
3. A grip comprising a body-section, and parallel sections pivoted to the body-section, buffers near the ends of the pivoted sections to contact with the body-section.

4. A grip comprising sections secured together centrally in such a manner as to permit a rocking movement of the sections, buffers carried by the sections.

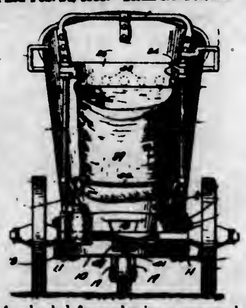
808,788. COLLAPSIBLE TRUCK. CHARLES H. FISCHER, West Harrison, Ind. Filed Sept. 3, 1904. Serial No. 223,194.

Claim.—In a collapsible truck, the combination of the lengthwise pieces A A' respectively having the grooves *a a'*, the cross-piece B pivotally connected to both said lengthwise pieces at one end of the latter, said cross-piece having the groove *b*, a caster at each of said latter ends, and a caster at each of the other ends of said lengthwise pieces, said pieces folding by being swung on their pivots with said lengthwise pieces relatively reversed lengthwise and the outer side of one of said lengthwise pieces facing the inner side of the other of said lengthwise pieces, substantially as described.

808,738.



808,739. STREET-SWEEPER'S CART. GEORGE POCHT, Hoboken, N. J. Filed Feb. 24, 1905. Serial No. 247,186.



Claim.—1. A wheeled frame having upper and lower spaced supports for a main receptacle, the upper support being arranged to partly encircle the rear portion of said receptacle, and a clamping means carved to conform to said upper support and coacting therewith to hold an auxiliary receptacle.

2. A wheeled frame having a plurality of spaced supports for a main receptacle, one of said supports constituting a bag-clamping bar, and a second bar coacting therewith, said bars being provided with interfitting projections and recesses for engagement with a bag.

3. The combination with a wheeled frame arranged for the reception of a main receptacle, of an elevated bar supported by the frame and shaped to conform to the contour of the receptacle, and a second clamping-bar coacting therewith, the bars being provided with interfitting projections and recesses for engagement with a bag.

4. A cart having a flanged frame for the support of a receptacle, and a receptacle-locking means carried by the flange of said frame and engaging the lower portion of the receptacle.

5. The combination with a frame including an annular flange arranged for the reception of a receptacle, locking devices carried by said annular flange, an auxiliary receptacle-support arranged in a plane above the flange, and a pivotally-mounted clamping-bar serving in connection with said auxiliary support to clamp and hold the bag.

6. In apparatus of the class described, the combination with a wheeled frame including an annular flange arranged for the support of a receptacle, receptacle-locking devices at the front and rear of said flange, axle-boxes formed integral with the flange and provided with axle-receiving slots, axles extending through said slots, springs arranged within the boxes and bearing on the axle, wheels carried by the axle, inclined bars extending upward from points adjacent to the axle-boxes, a combined clamping and supporting bar carried by the upper ends of said bars, an auxiliary clamping member pivoted to one of said bars and coacting with said clamping and supporting bar to engage with and hold the bag.

7. In a device of the class specified, a wheeled frame, a detachable receptacle carried thereby, means for interlocking the frame and receptacle, and an operating-handle rigidly secured to and extending rearward from the receptacle to permit tilting of the wheeled frame and receptacle, and for propelling and guiding the same, the handle serving, also, as a means for manipulating the receptacle when the latter is detached.

808,740. TRANSPORTER. JOHN J. FRANK, Schenectady, N. Y., assignor to Grondal Electric Company, a Corporation of New York. Filed Mar. 27, 1903. Serial No. 149,174.

Claim.—1. A magnetic core formed of a number of similar units, each of which is composed of a plurality of bundles of laminæ, the laminæ in the different bundles being successively displaced so that each bundle is an oblique prism, the laminæ in some of the different bundles in each unit being displaced in opposite directions so that the acute solid angles of one bundle correspond to the obtuse solid angles of the other.

2. A magnetic core formed of three laminated units, the planes of lamination intersecting each other at one hundred and twenty degrees, each unit being formed of a plurality of bundles, some of said bundles overlapping the others to form tenons which interlock with the other bundles.

3. In a magnetic core, a body of magnetic material formed of three units or portions, each of which is laminated in planes intersecting the planes of lamination of the other units at angles of one hundred and twenty degrees, each unit being formed of two or more bundles of laminæ, the edges of the laminæ in one bundle of each unit being parallel to the planes of lamination of another unit, and the corresponding edges of another bundle terminating in a plane parallel to the planes of lamination of the other unit.

4. In a magnetic core, a portion formed of three units, each unit being formed of two or more bundles of laminæ, the planes of lamination of each unit being at one hundred and twenty degrees angle with the planes of lamination of the other units, one bundle in each unit projecting by another bundle in said unit, the laminæ in each unit being so arranged that the plane in which the edges of one bundle in each unit terminate is parallel to the plane of lamination of one of the other units, while the corresponding edges of another bundle in the same unit terminate in a plane parallel to the plane of lamination of the second of said other units.

5. In combination, a winding substantially annular, a plurality of magnetic core-sections linked about said winding, each of said core-sections being in the form of a body composed of laminæ each of which has an opening in it through which the winding is passed, the laminæ in each body being so arranged that the opening through the body is not straight but has one portion inclined at an angle to another portion.

6. In combination, a winding substantially annular, a plurality of magnetic core-sections linked about said winding, each of said core-sections being in the form of a body composed of laminæ, each of which has an opening in it through which the winding is passed, the laminæ in each of said bodies being arranged so that the passage through the body is not straight but is formed with one portion which is substantially tangential to the portion of the winding in proximity to it, and another portion removed from the first which is substantially tangential to the portion of the winding in proximity with it.

7. In a transformer, a core comprising a prism-shaped leg or part polygonal in cross-section and one or more outer legs, the surface adjacent said prism-shaped leg formed in two parts, one of said parts being substantially parallel to one side of the prism-shaped central leg and the other part being parallel to a second side of said prism-shaped central leg.

8. In a transformer, a core comprising a prism-shaped leg or branch polygonal in cross-section, and one or more other legs, the surface adjacent said prism-shaped leg of each of the other legs being formed in two parts, one of said parts being substantially parallel to one side of the prism-shaped central leg and the other part being parallel to an adjacent side of said prism-shaped leg.

9. In a transformer, a core comprising a prism-shaped leg or branch polygonal in cross-section, and one or more other legs, the surface adjacent said prism-shaped leg of each of the other legs being formed in two parts, one of said parts being substantially parallel to one side of the prism-shaped central leg and the other part being parallel to an adjacent side of said prism-shaped leg, a winding surrounding said prism-shaped leg, the inner and outer surface of said winding being substantially similar to the surface of said prism-shaped leg or branch.

808,741. COKE-HANDLING APPARATUS. GEORGE G. PETER, Syracuse, N. Y. Filed Mar. 24, 1902. Serial No. 99,955.

Claim.—1. The combination in a coke-handling apparatus with a coke-oven; of a device for discharging the body of coke from the oven, and a platform for receiving the body of coke, said platform being movable on an axis arranged in a plane at an angle to the path of the body of coke during the passage of said coke through the oven, substantially as and for the purpose described.

2. The combination in a coke-handling apparatus with a coke-oven; of a device for discharging the body of coke from the oven, and a platform for receiving the body of coke, said platform being movable on an axis substantially crosswise of the path of the body of coke during its passage through the oven, substantially as and for the purpose specified.

3. The combination in a coke-handling apparatus with a coke-oven; of a device for discharging the body of coke from the oven, and a platform for receiving the body of coke, said platform being movable on an axis substantially crosswise of the path of the body of coke during its passage through the oven, and being arranged with its axis at the side of said path of the coke, substantially as and for the purpose set forth.

4. The combination in a coke-handling apparatus with a coke-oven; of a device for discharging the body of coke in a substantially horizontal plane from the oven, and a platform for receiving the body of coke, said platform being movable on a substantially upright axis crosswise of the path of the body of coke during its passage through the oven, substantially as and for the purpose described.

5. The combination in a coke-handling apparatus with a coke-oven; of a device for discharging the body of coke from the oven, and a platform for receiving the body of coke, said platform being movable on an axis substantially crosswise of the path of the body of coke during its passage through the oven, and being movable on an axis disposed at an angle to the first-mentioned axis for discharging the coke, substantially as and for the purpose specified.

6. The combination in a coke-handling apparatus with a coke-oven; of a device for discharging the body of coke from the oven, a frame, a platform for receiving the body of coke, said platform being journaled in the frame on axes disposed at an angle to each other and being movable relatively to the frame on one axis substantially crosswise of the path of the body of coke during its passage through the oven, and being movable relatively to the frame on the other axis for discharging the coke, and means for moving the platform relatively to the frame, substantially as and for the purpose set forth.

7. The combination in a coke-handling apparatus with a coke-oven; of a device for discharging the body of coke from the oven, and a platform for receiving and retaining the body of coke, said platform, for discharging the coke, being movable on an axis arranged substantially parallel to the path of the body of coke during its passage through the oven, substantially as and for the purpose specified.

8. The combination in a coke-handling apparatus with a coke-oven; of a device for discharging the body of coke from the oven, a platform for receiving the body of coke, said platform being movable on an axis arranged in a plane at an angle to the path of the body of coke during the passage of said coke through the oven, and means for additionally moving the platform for discharging the coke therefrom, substantially as and for the purpose described.

9. The combination in a coke-handling apparatus with a coke-oven; of a device for discharging the body of coke from the oven, a platform for receiving and retaining the body of coke, said platform being movable on an axis substantially crosswise of the path of the body of coke during its passage through the oven and being movable on a second axis for discharging the coke from the platform, and means for moving the platform on said second axis, substantially as and for the purpose specified.

10. The combination in a coke-handling apparatus with a coke-oven; of a device for discharging the body of coke from the oven, a platform for receiving and retaining the body of coke, said platform being movable on an axis arranged in a plane at an angle to the path of the body of coke during the passage of said coke through the oven, a retaining-wall for preventing the escape of the coke from the platform, and means for changing the position of the platform relatively to the retaining-wall and thereby discharging the coke from the platform, substantially as and for the purpose set forth.

11. The combination in a coke-handling apparatus with a coke-oven; of a device for discharging the body of coke from the oven, a platform for receiving and retaining the body of coke, said platform being movable on an axis substantially crosswise of the path of the body of coke during its passage through the oven, a retaining-wall for preventing the escape of the coke from the platform, said retaining-wall being formed with an opening arranged at the side of the axis, and means for moving the platform and thereby discharging the coke therefrom, substantially as and for the purpose described.

12. In a coke-handling apparatus and in combination, a coke-oven having an exit-opening for the coke, means for discharging the coke from the oven in a compact mass or body, and movably-mounted receiving means therefor arranged to have movement imparted thereto by the coke in the discharge movement of the same to carry the surface which has received a body of coke out of register with the exit-opening of the oven and to bring other surfaces of said receiving means into register with said exit-opening, substantially as described.

13. In a coke-handling apparatus and in combination, a rotatable receiving-surface, a coke-oven, and means for discharging a body of coke from said oven in a compact body or mass onto said surface, substantially tangentially of the latter, substantially as described.

14. In a coke-handling apparatus, the combination with a coke-oven, and means for discharging coke therefrom in a compact mass or body, of a rotatable receiving-surface arranged substantially tangentially in relation to the line of movement of said body of coke, substantially as described.

15. In a coke-handling apparatus, the combination with a coke-oven, and means for discharging the coke therefrom in a compact mass or body, of a rotatable receiving-surface arranged to receive said body of coke substantially tangentially of the same, substantially as described.

16. In a coke-handling apparatus, the combination with a coke-oven, and means for discharging the coke therefrom in a compact mass or body, of a receiving-surface movable transversely of the line of movement of the discharged coke, and having an additional movement in the line of formation of the discharged body of coke to bring all portions of its surface into register with said coke-chamber with a minimum breakage of the discharged body of coke, substantially as described.

17. In a coke-handling apparatus, the combination with a plurality of parallel coke-ovens, and means for discharging the coke therefrom along substantially parallel paths, of receiving means having movement transversely of said paths to successively register with each of the same and having an additional movement to successively bring different parts of the receiving-surface thereof substantially in tangential relation to said paths of movement, substantially as described.

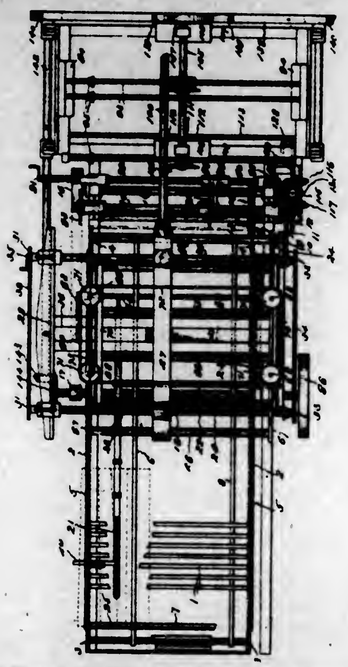
808,742. MACHINE FOR FORMING BOX-SHOOKS. HENRY A. GALE, Hartford, Conn., assignor to Georgiana C. Gale, Hartford, Conn. Filed July 29, 1905. Serial No. 271,791.

Claim.—1. A machine for forming box-shooks having a stationary jaw, a movable jaw, a movable bed for supporting and advancing the shooks lengthwise between the jaws, means for moving the movable jaw toward the stationary jaw and squeezing the shooks between the jaws, means which automatically arrest this movement of the movable jaw and release the squeeze when the required pressure is obtained, and coöperating mechanism for actuating these means, substantially as specified.

2. A machine for forming box-shooks having a stationary jaw, a movable jaw, a movable bed for supporting and advancing the shooks lengthwise between the jaws, means for moving the movable jaw toward the stationary jaw and squeezing the shooks between the jaws, means which automatically arrest this movement of the movable jaw and release the squeeze when the required pressure is obtained, means for moving the movable jaw away from the stationary jaw, and coöperating mechanism for actuating these means, substantially as specified.

3. A machine for forming box-shooks having a stationary jaw, a movable jaw, a movable bed for supporting and advancing the shooks lengthwise between the jaws, means for moving the movable jaw toward the stationary jaw and squeezing the shooks between the jaws, means which automatically arrest this movement of the movable jaw and release the squeeze when the required pressure is obtained, means for moving the movable jaw away from the sta-

tionary jaw, means for trimming the edges of the shooks, and co-operating mechanism for actuating these means, substantially as specified.



4. A machine for forming box-shooks having a stationary jaw, a movable jaw, a movable bed for supporting and advancing the shooks lengthwise between the jaws, means for moving the movable jaw toward the stationary jaw and squeezing the shooks between the jaws, means which automatically arrest this movement of the movable jaw and release the squeeze when the required pressure is obtained, means for moving the movable jaw away from the stationary jaw, means for trimming the edges of the shooks, means for trimming the ends of the shooks, and coöperating mechanism for actuating these means, substantially as specified.

5. A machine for forming box-shooks having a stationary jaw, a movable jaw, a movable bed for supporting and advancing the shooks lengthwise between the jaws, means for moving the movable jaw toward the stationary jaw and squeezing the shooks between the jaws, means which automatically arrest this movement of the movable jaw and release the squeeze when the required pressure is obtained, means for moving the movable jaw away from the stationary jaw, means for trimming the ends of the shooks, and coöperating mechanism for actuating these means, substantially as specified.

6. A machine for forming box-shooks having a jaw adjustably fixed near the back of the bed, a jaw near the front of the bed and movable toward and from the stationary jaw, a movable bed for supporting and advancing the shooks lengthwise between the jaws, means for moving the movable jaw toward the stationary jaw and squeezing the shooks between the jaws, means which automatically arrest this movement of the movable jaw and release the squeeze when the required pressure is obtained, means for moving the movable jaw away from the stationary jaw, means for trimming the edges of the shooks, means for trimming the ends of the shooks, and coöperating mechanism for actuating these means, substantially as specified.

7. A machine for forming box-shooks having a stationary jaw, a movable jaw, means for moving the movable jaw toward the stationary jaw and squeezing the shooks between the jaws, means which automatically arrest this movement of the movable jaw and release the squeeze when the required pressure is obtained, and means for moving the movable jaw away from the stationary jaw, substantially as specified.

8. A machine for forming box-shooks having a stationary jaw, a movable jaw, a movable bed for supporting and advancing the shooks lengthwise between the jaws, means for moving the movable jaw toward the stationary jaw and squeezing the shooks between the jaws, means which automatically arrest this movement of the movable jaw and release the squeeze when the required pressure is obtained, means for moving the movable jaw away from the stationary jaw, two saws adjustable toward the front and back of the machine for trimming the edges of the shooks, two saws adjustable toward and from the ends of the machine for trimming the ends of the shooks, and coöperating mechanism for actuating these means, substantially as specified.

9. A machine for forming box-shooks having chains movable longitudinally of the machine, slats attached to and movable with the chains and forming a bed for supporting and advancing the shooks, rolls for holding the shooks down on the bed, a stationary jaw, a movable jaw, means for moving the movable jaw toward the stationary jaw and squeezing the shooks between the jaws, means which automatically arrest this movement of the movable jaw and release the squeeze when the required pressure is obtained, means for moving the movable jaw away from the stationary jaw, saws for trimming the edges of the shooks, saws for trimming the ends of the shooks, and mechanism for actuating the chains, the jaws and the saws, substantially as specified.

10. A machine for forming box-shooks having a stationary jaw, a movable jaw, a movable bed for supporting and advancing the shooks lengthwise between the jaws, means for moving the movable jaw toward the stationary jaw and squeezing the shooks between the jaws, means which automatically arrest this movement of the movable jaw and release the squeeze when the required pressure is obtained, means for moving the movable jaw away from the stationary jaw, saws rotatable in longitudinal planes and supported by fixed bearings, and saws rotatable in transverse planes and supported by movable bearings, substantially as specified.

11. A machine for forming box-shooks having a movable bed, rolls for holding the shooks down upon the bed, vertically-adjustable frames supporting said rolls, means for adjusting the frames vertically, a stationary jaw, a movable jaw, means for moving the movable jaw toward the stationary jaw and squeezing the shooks between them, means which automatically arrest this movement of the movable jaw and release the squeeze when the required pressure is obtained, and means for moving the movable jaw away from the stationary jaw, substantially as specified.

12. A machine for forming box-shooks having chains, mechanism for moving the chains, slats attached to the chains, feeding-ribs attached to the slats at intervals, mechanism for stopping the feeding of the bed, a stationary jaw, a movable jaw, means for moving the movable jaw toward the stationary jaw and squeezing the shooks between the jaws, means which automatically arrest this movement of the movable jaw and release the squeeze when the required pressure is obtained, means for moving the movable jaw away from the stationary jaw, rolls for holding the shooks down upon the bed, saws for trimming the edges of the shooks, feed-rolls for advancing the shooks, and saws for trimming the ends of the shooks, substantially as specified.

13. In a machine for forming box-shooks the combination of supporting-rods, a stationary jaw carried by the rods, feed-screws engaging and holding the stationary jaw, means for rotating the feed-screws and adjusting the stationary jaw longitudinally of the supporting-rods, a slide supported by the frame, means for moving the slide toward and from the stationary jaw, and a movable jaw pivoted on the slide, substantially as specified.

14. In a machine for forming box-shooks the combination of supporting-rods, a stationary jaw carried by the rods, means for adjusting the jaw on the rods, a slide movable on the frame, a movable jaw pivoted on the slide, gearing for moving the slide toward the stationary jaw, mechanism for disconnecting the gearing when the pressure between the jaws reaches the predetermined degree, and mechanism for moving the slide away from the stationary jaw, substantially as specified.

15. In a machine for forming box-shooks the combination of an adjustable stationary jaw, a movable jaw, gearing for moving the movable jaw toward the stationary jaw, and a spring mechanism for holding the gearing in engagement and adapted to yield and permit the disengagement of the gearing when the pressure between the jaws overcomes the tension of the spring, substantially as specified.

16. A machine for forming box-shooks having a stationary jaw, a movable jaw, a movable bed for supporting and advancing the shooks lengthwise between the jaws, means for moving the movable jaw toward the stationary jaw and squeezing the shooks between the jaws, means which automatically arrest this movement of the movable jaw and release the squeeze when the required pressure is obtained, means for moving the movable jaw away from the stationary jaw, a carriage movable toward and from the back of the machine, means for moving the carriage toward and from the back of the machine, and means for rotating the saws while they are being carried toward and from the back of the machine, substantially as specified.

17. In a machine for forming box-shooks the combination of a carriage movable toward and from the back of the machine, means for moving the carriage toward and from the back of the machine, a shaft borne by the carriage, a saw fixed to the shaft, a saw adjustable on the shaft, means for rotating the shaft while it is being carried toward and from the back, a carriage movable toward and from the side of the machine, and means connecting the sidewise-moving carriage and the adjustable saw borne by the backward-moving carriage whereby when one is adjusted the other is also adjusted, substantially as specified.

808,743. **CHURN-DASHER.** WILLIAM L. HART, Mansfield, Mo., assignor of one-half to J. B. Hart, Mansfield, Mo. Filed June 27, 1904. Serial No. 214,389.

Claim.—1. A device of the kind described comprising a dasher-rod, winged, cup-shaped dashers carried by the said rod, the wings of the upper dasher extending upwardly, and those of the lower dasher downwardly, and a dasher having inclined blades arranged on the rod between the cup-shaped dashers.

2. The combination with a dasher-rod, of oppositely-arranged cup-shaped dashers, having wings formed with a radial torsional twist, said dashers being arranged in vertical alinement, the upper dasher rotates in one direction on a downstroke and in an opposite direction on the upstroke and the lower dasher rotates in an opposite direction on an upstroke to what it does on a downstroke, and a dasher having inclined blades arranged between the first-mentioned dashers and adapted to rotate in reverse direction of the up and down strokes, respectively.

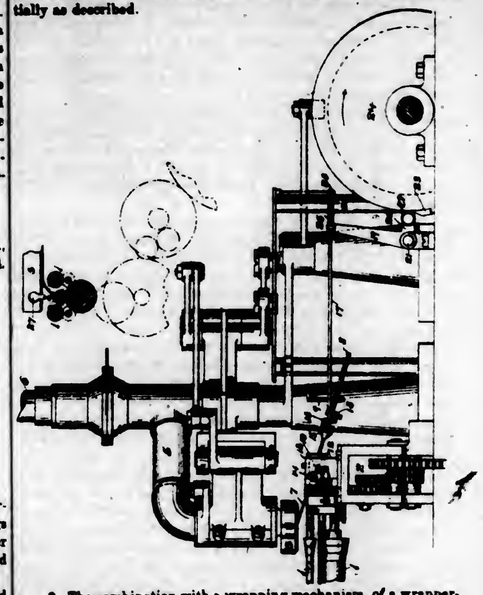
3. The combination with a dasher-rod, of oppositely-arranged cup-shaped dashers having wings formed with a radial torsional twist, said dashers being secured to the end of the said rod in vertical alinement by a screw passing through the openings in the dashers, the dashers rotating in reverse directions on their up and down strokes, and a dasher having inclined blades arranged between said dashers on the screw and adapted to rotate in reverse directions of the up and down stroke, respectively.

808,744. **ENAMELED ORNAMENT.** OTTO L. HEINTZ, Buffalo, N. Y. Filed Feb. 15, 1905. Serial No. 245,668.

Claim.—The herein-described method of producing enameled ornaments which consists in placing face upward a pattern bearing a design in relief, then applying a coat of powdered enamel upon the upturned face of said pattern, then applying an adhesive to the article to be ornamented, then bringing said adhesive coated surface while the same is turned downward in contact with the powdered enamel on the high parts of the pattern whereby said enamel is lifted off from the high parts of the pattern and transferred to the adhesive coated surface of said article, and then heating said article and the enamel thereon for melting and hardening the enamel and causing the same to adhere to said article, substantially as set forth.

808,745. **WRAPPER-TRANSFERRING MECHANISM.** FREDERICK L. HEMMINGWAY, New York, N. Y., and HARRY KNIGHT, Jersey City, N. J., assignors to International Cigar Machinery Company, New York, N. Y., a Corporation of New Jersey. Filed Apr. 3, 1905. Serial No. 253,253.

Claim.—1. The combination with a wrapping mechanism, of a wrapper-support on which a wrapper is held, and a device operating to positively engage one end of the wrapper on the support, transfer it to and hold it against the article to be wrapped in the wrapping mechanism at the beginning of the wrapping operation, substantially as described.



2. The combination with a wrapping mechanism, of a wrapper-support on which a wrapper is held, means for effecting a relative movement between the wrapping mechanism and the support to deliver the wrapper to the wrapping mechanism, and a device operating to positively engage one end of the wrapper on the support, transfer it to and hold it against the article to be wrapped in the wrapping mechanism at the beginning of the wrapping operation, substantially as described.

3. The combination with a wrapping mechanism, of a wrapper-support lying in a plane which does not intersect the wrapping mechanism, means for effecting a relative movement between the wrapping mechanism and the support for causing the wrapper to be delivered to the article to be wrapped in the wrapping mechanism, and a transferring device operating to positively engage one end of the wrapper on the support, transfer it to and hold it against said article to be wrapped at the beginning of the wrapping operation, substantially as described.

4. The combination with a wrapping mechanism, of a suction wrapper-support lying in a plane which does not intersect the wrapping mechanism, means for effecting a relative movement between the wrapping mechanism and the support for causing the wrapper to be delivered to the article to be wrapped in the wrapping mechanism, and a transferring device operating to positively engage one end of the wrapper on the support, transfer it to and hold it against said article to be wrapped at the beginning of the wrapping operation, substantially as described.

5. The combination with a support on which a wrapper is held, of a wrapping mechanism, a finger, and means for operating the finger to engage the wrapper on the support, transfer it to and hold it against the article to be wrapped in the wrapping mechanism at the beginning of the wrapping operation, substantially as described.

6. The combination with a suction wrapper-support on which the wrapper is held, of a wrapping mechanism, a finger, and means for operating the finger to engage the wrapper on the support, transfer it to and hold it against the article to be wrapped in the wrapping mechanism at the beginning of the wrapping operation, substantially as described.

7. The combination with a recessed wrapper-support, of a wrapping mechanism, a finger, and means for operating the finger to cause it to enter the recess in the support and take the wrapper and then transfer it to the article to be wrapped in the wrapping mechanism, substantially as described.

8. The combination with a suction wrapper-support having a recessed face, of a wrapping mechanism, a finger, and means for operating the finger to cause it to enter the recess in the support and take the wrapper and then transfer it to the article to be wrapped in the wrapping mechanism, substantially as described.

9. The combination with a recessed wrapper-support, of a wrapping mechanism comprising suitable rollers, a transferring-finger, and means for operating the finger to cause it to enter the recess in the support and take the wrapper and then transfer it from the support to the article to be wrapped in the wrapping mechanism, substantially as described.

10. The combination with a recessed suction wrapper-support, of a wrapping mechanism comprising suitable rollers, a transferring-finger, and means for operating the finger to cause it to enter the recess in the support and take the wrapper and then transfer it from the support to the article to be wrapped in the wrapping mechanism, substantially as described.

11. The combination with a wrapper-support having a recess therein, of a wrapping mechanism, a transfer-finger, means for adjusting the finger to cause it to register with the support, and means for operating the finger to cause it to enter the recess in the support and take the wrapper and then transfer it from the support to the article to be wrapped in the wrapping mechanism, substantially as described.

12. The combination with a suction wrapper-support having a recess therein, of a wrapping mechanism, a transfer-finger, means for adjusting the finger to cause it to register with the support, and means for operating the finger to cause it to enter the recess in the support and take the wrapper and then transfer it from the support to the article to be wrapped in the wrapping mechanism, substantially as described.

13. The combination with a roller wrapping mechanism, of a recessed suction wrapper-support, means for giving the support a movement to deliver the wrapper to the wrapping mechanism, means for reciprocating the finger, and a guide operating to direct the finger into the recess in the support and to move the finger from the support to the wrapping mechanism, substantially as described.

14. The combination with a roller wrapping mechanism, of a suction wrapper-support having a recessed face, means for effecting a relative movement between the support and the wrapping mechanism, whereby the wrapper is delivered to the article in the wrapping mechanism, a finger, a conical collar on the finger, a guide-block having a conical recess therein, and means whereby the block may be adjusted, substantially as described.

15. The combination with a roller wrapping mechanism, of a suction wrapper-support having a recessed face, means for effecting a relative movement between the support and the wrapping mechanism, whereby the wrapper is delivered to the article in the wrapping mechanism, a finger, a conical collar on the finger, a circular block having a conical recess eccentrically located therein, and a holder in which the block is adjustably mounted, substantially as described.

16. The combination with a wrapping mechanism, of a wrapper-support having a recessed face, means for effecting a wrapper-delivery movement between the wrapping mechanism and the support, a finger, a conical collar mounted therein, a circular guide-block having a conical recess eccentrically located therein, a bearing in which the block may be adjusted, and means for reciprocating the finger, substantially as described.

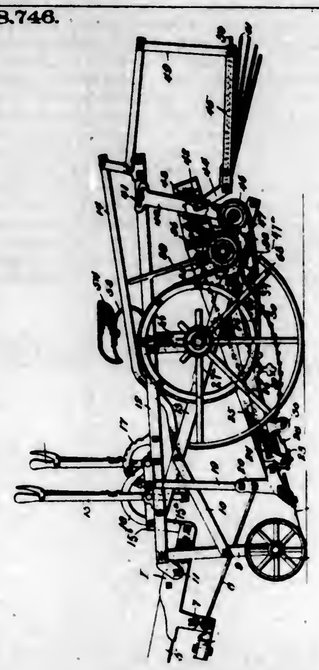
808,746. POTATO-DIGGER. JOHN HAY, Orange township, Cuyahoga county, Ohio. Filed Feb. 11, 1905. Serial No. 245,206.

Claim.—1. In a potato-digger, in combination, a main frame having a gage-wheel at the front end, a vertically-swinging frame pivoted on said frame and having a shovel at its front end, the shovel being adjustable vertically with respect to the main frame and gage-wheel, a tongue hinged to the main frame, and a lever fulcrumed on the main frame and connected to the tongue and adapted to lift the front end of the main frame, which lever swings free when the main frame is lowered.

2. In a potato-digger, in combination, a tilting frame comprising upper and lower side bars, the inclined bars 13 extending therebetween, and an arch-bar fixed to the upper side bars and having angular branches which fit upon and are secured to the said inclined bars, and carrying stub-axles for the wheel.

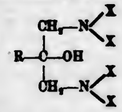
3. In a potato-digger, in combination, a tilting and adjustable frame comprising upper side bars, inclined bars rigid therewith and extending downwardly and backwardly therefrom, lower shovel-supporting bars pivoted at the rear ends to the inclined bars and projecting forwardly therefrom, and a lever fulcrumed on the upper bars and connected to the front ends of said lower bars.

808,746.



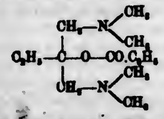
808,747. BETA-SUBSTITUTED ESTER OF DIAMINOGLYCERIN AND PROCESS OF MAKING SAME. FRITZ HOFMANN, Elberfeld, Germany, assignor to Farbenfabriken of Elberfeld Co., New York, N. Y., a Corporation of New York. Filed July 17, 1905. Serial No. 270,106.

Claim.—1. The herein-described new beta-substituted esters of diaminoglycerin produced from beta-substituted diaminoglycerins which compounds are oils and on prolonged boiling, preferably with dilute acids, split off organic acids under the formation of beta-hydroxy compounds of the following general formula:



in which X represents hydrogen atoms, any of them may be replaced by hydrocarbon radicals and the latter R represents a hydrocarbon radical and which compounds, being of a dibasic character, form two series of salts with acids, substantially as hereinbefore described.

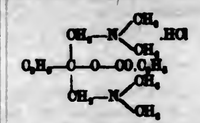
2. The herein-described new benzoyl derivative of beta-ethyltetramethyldiaminoglycerin having the formula:



being an oil boiling at 165° centigrade under a pressure of ten millimeters and being split up into benzoic acid and beta-ethyltetramethyldiaminoglycerin on being boiled with hydrochloric acid and being of a dibasic character forms two series of salts with acid, substantially as hereinbefore described.

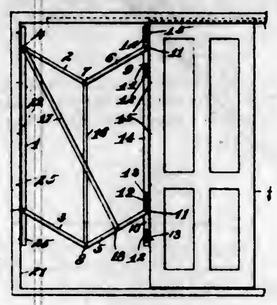
808,748. BENZOYL CHLORID DERIVATIVE OF BETA-ETHYLTETRAMETHYLDIAMINOGLYCERIN. FRITZ HOFMANN, Elberfeld, Germany, assignor to Farbenfabriken of Elberfeld Co., New York, N. Y., a Corporation of New York. Filed June 24, 1905. Serial No. 266,866.

Claim.—The herein-described new hydrochlorid of the benzoyl derivative of beta-ethyltetramethyldiaminoglycerin having the formula:



forming white crystals melting at 169° centigrade which are soluble in water and in acetone, and being a valuable local anesthetic, substantially as described.

808,749. SUPPORT FOR SLIDING DOORS. LARS HOLMER, Limhamn, Sweden. Filed Sept. 23, 1904. Serial No. 225,023.



Claim.—1. In a support for sliding doors, in combination, a supporting member; a pair of arms pivotally connected with said supporting member; an arm connecting said pair of arms for maintaining them in parallel relation; a link pivotally connected with the outer end of each one of said pair of arms; means for pivotally attaching said links to a door; and a carrying-link pivotally connected with said supporting member and one of said links.

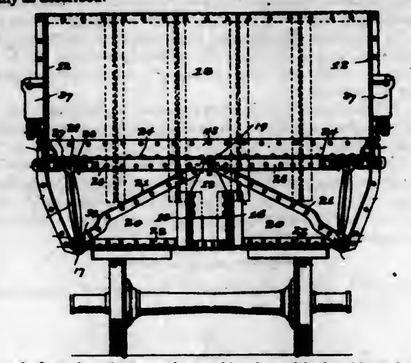
2. In a support for sliding doors, in combination, a supporting-member; a pair of arms pivotally connected with said supporting member; an arm connecting said pair of arms for maintaining them in parallel relation; a link pivotally connected with the outer end of each one of said pair of arms; a plate pivotally connected with the outer end of each of said links; means for adjustably connecting said plates to a door; and a carrying-link pivotally connected with said supporting member and one of said links.

3. In a support for sliding doors, in combination, a supporting member; a pair of arms pivotally connected with said supporting member; an arm connecting said pair of arms for maintaining them in parallel relation; a link pivotally connected with the outer end of each one of said pair of arms; an angular bar, one flange of which is adapted to be attached to a door; means for adjustably connecting the outer ends of said links to said angular bar; and a carrying-link pivotally connected with said supporting member and one of said links.

808,750. DUMPING-CAR. FRED M. HUBBARD and CHARLES R. TAYLOR, Chicago, Ill., assignors, by mesne assignments, to National Coal Dump Car Company, Rapid City, S. D., a Corporation of South Dakota. Filed Nov. 23, 1903. Serial No. 183,231.

Claim.—1. In a dumping-car, the combination with the side and end walls of a car-body and a suitable supporting-underframing, of a car-bottom composed of floor-sections hinged to the underframing along the longitudinal median line of the car-bottom, displaceable strut members hinged to and supporting the outer side margins of said hinged floor-sections in a horizontal load-carrying position, means for tripping and throwing inwardly the lower ends of said hinged strut members, and means for raising and lowering the outer side margins of said hinged floor-sections between load-carrying and load-discharging positions, substantially as described.

2. In a dumping-car, the combination with a suitable supporting-underframing, of a car-floor composed wholly of a plurality of sections hinged to the underframing along the longitudinal median line of the car-floor, depending strut members hinged to the outer margins of said hinged floor-sections, shoes supporting the lower ends of said strut members, and means for rocking said shoes to trip and displace said strut members from supporting position, substantially as described.



3. In a dumping-car, the combination with the side and end walls of a car-body and a suitable supporting-underframing, of a car-bottom composed of floor-sections hinged to the underframing along the longitudinal median line of the car-bottom, manually-operable suspension devices mounted on the side walls of the car-body and connected to the outer margins of said hinged floor-sections, displaceable strut members hinged to and supporting the outer side margins of said floor-sections in a horizontal or load-carrying position, pivoted shoes having sockets adapted to seat the lower ends of said strut members, and means for rocking said shoes to trip said strut members, substantially as described.

4. In a dumping-car, the combination with the side and end walls of a car-body and a suitable supporting-underframing, of a car-bottom composed of floor-sections hinged to the underframing along the longitudinal median line of the car-bottom, a series of pulleys mounted on the side walls of the car-body, flexible connections between said pulleys and the outer margins of said hinged floor-sections, and gearing connected to and actuating said pulleys, substantially as described.

5. In a dumping-car, the combination with the side and end walls of a car-body and a suitable supporting-underframing, of a car-bottom composed of floor-sections hinged to the underframing along the longitudinal median line of the car-bottom, said floor-sections having a series of extension members projecting outwardly beneath the side walls of the car-body, a series of pulleys mounted on the side walls of the car-body, flexible connections between said pulleys and said extension members, devices carried by the latter engaging and laterally bonding the lower margins of the side walls of the car-body when said floor-sections are in load-carrying position, and gearing connected to and actuating said pulleys, substantially as described.

6. In a dumping-car, the combination with the side and end walls of a car-body and a suitable supporting-underframing, of a car-bottom composed of floor-sections hinged to the underframing along the longitudinal median line of the car-body, a series of hangers rigidly secured to and depending from the side walls of the car-body, a longitudinally-extending inverted angle-iron secured to the lower ends of said hangers on each side of the car-body, a plurality of struts pivoted to the outer side margins of said hinged floor-sections, a series of oscillatory shoes carried by said angle-irons beneath said struts, respectively, and an actuating-rod extending through the series of shoes on each side of the car whereby said shoes may be simultaneously rocked to trip and displace the lower ends of said strut members supported thereby to permit the fall of the floor-sections, substantially as described.

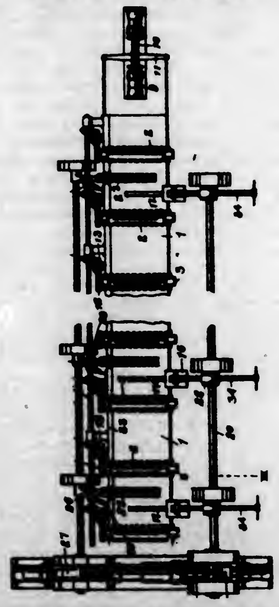
7. In a dumping-car, the combination with a suitable underframing, of a car-floor composed of a plurality of sections hinged to the underframing along the longitudinal median line of the car-floor, the floor-section on one side of said longitudinal median line being provided with a downwardly-offset upwardly-convexed marginal extension overlying said median line, and the floor-section on the opposite side of said longitudinal median line having a downwardly-turned marginal portion overlying said downwardly-offset convex marginal portion of the other floor-section, substantially as described.

8. In a dump-car of the class described, the combination of a supporting-framework, a drop-bottom therefor formed of a plurality of swinging sections pivotally secured to the framework of the car, a

plurality of pulleys with their axes transversely arranged and rotatably mounted on the supporting-frame of the car, chain mechanism securing such pulleys and swinging sections of the drop-bottom together, and mechanism extending longitudinally of the car at right angles to the axes of the pulleys and operatively connected with such pulleys for operating or rotating such pulley mechanisms, substantially as described.

9. In a dump-car of the class described, the combination of a supporting-framework, a drop-bottom portion formed of a plurality of swinging sections pivotally secured at their inner edges thereto, a plurality of pulley mechanisms rotatably mounted on the frame of the car transversely thereof, chain mechanism securing the pulleys to the swinging bottom-sections, an operating-bar, and means connecting each operating-bar to each and every pulley to rotate the same, substantially as described.

808,751. **STRAIGHTENING-TABLE.** SIGMUND V. HUMMEL, Pittsburg, Pa. Filed Aug. 23, 1905. Serial No. 275,496.



Claim.—1. A straightening-table having in combination a sectional bed provided with a longitudinal abutment, a series of positively-driven rollers, means for raising and lowering the rollers, presser-blocks movable toward and from the abutment, and clamping-arms extending transverse of the bed and movable toward and from the same.

2. A straightening-table having in combination a bed provided with a longitudinal abutment, presser-blocks movable transverse of the bed, arms extending transverse of the bed and movable toward and from the same, and means for moving the arms laterally.

3. A straightening-table having in combination a sectional bed provided with a longitudinal abutment, a series of positively-driven rollers, means for raising and lowering the rollers, presser-blocks movable toward and from the abutment, arms extending transverse of the bed and movable toward and from the same, and means for swinging the arms laterally.

808,752. **HELICALLY-RIFFLED FLUID PIPE-LINE.** JOHN D. ISAAC, Oakland, and JAMES B. STONE, Berkeley, Cal., assignors to Riffel Pipe Company, San Francisco, Cal., a Corporation of California. Filed June 23, 1905. Serial No. 266,870.

Claim.—1. A pipe-line the interior wall of which is provided with a helically-directed obstruction, said line having within it at intervals helically-twisted diaphragms.

2. In an apparatus for the method stated and in combination with means for supplying the lighter and heavier fluids to the pipe-line, a pipe-line the interior wall of which is provided with a helically-directed obstruction, said line having within it at intervals helically-twisted diaphragms.

808,753. **VAPOR ELECTRIC APPARATUS.** ALEXANDER M. JACKSON, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed June 24, 1904. Serial No. 213,230.

Claim.—1. In a vapor electric apparatus, the combination of a container, an anode of non-vaporizable material, and a body of vaporizable material in the container in which the anode is nearly submerged.

2. In a vapor electric apparatus, the combination of a container, a body of mercury therein, and a carbon electrode projecting from said body of mercury and so connected in circuit as to operate as an anode.

3. In a vapor electric apparatus, the combination of a container, a body of mercury therein, a hollow electrode of solid material projecting from said body of mercury and having an opening in its wall to permit access of mercury to the interior of said electrode.

4. In a vapor electric apparatus, the combination of a container, a cathode of fluid material, an anode of solid material, a starting device consisting of a conductor adapted to connect said electrodes electrically and to break connection therewith simultaneously, and fluid material surrounding a portion of the solid electrode.

808,754. **METHOD OF APPLYING HEAT FOR THE TREATMENT OF ORES AND METALLIFEROUS SANDS.** WILLIAM J. JACKSON, San Francisco, Cal. Filed Mar. 30, 1905. Serial No. 253,579.

Claim.—1. The method of applying heat for the treatment of ores or metalliferous sands which consists in adding to said ores or metalliferous sands a suitable exothermic material capable of developing heat when the aqueous solution of the extracting reagent is applied thereto, substantially as described.

2. The method of applying heat for the treatment of ores or metalliferous sands which consists in adding thereto calcium oxid and an agent cooperating with the calcium oxid to liberate heat, substantially as described.

808,755. **ELECTRICAL BATTERY.** CARL JÄGER, Rock Island, Ill., assignor, by direct and mesne assignments, to Rock Island Battery Company, a Corporation of New Jersey. Filed Feb. 27, 1904. Serial No. 195,618.

Claim.—1. A battery-cell having a zinc cup, a carbon pencil within the cup, a compound of dioxid of manganese, iron-filings, and powdered graphite surrounding the carbon pencil, and a filling of flour and plaster-of-paris between the cup and the inclosed body.

2. A battery-cell consisting of a zinc cup, a carbon pencil centrally located in said cup and extending above the same, a porous compound of dioxid of manganese, iron-filings, and powdered graphite surrounding said pencil and containing in solution "ammonia caleidium," ferrocyanid of potash, alcohol, and chlorid of zinc.

3. In a battery-cell, a carbon pencil, a body of graphite, dioxid of manganese, and iron-filings surrounding the same, and an inclosing envelop of porous fabric secured to the same.

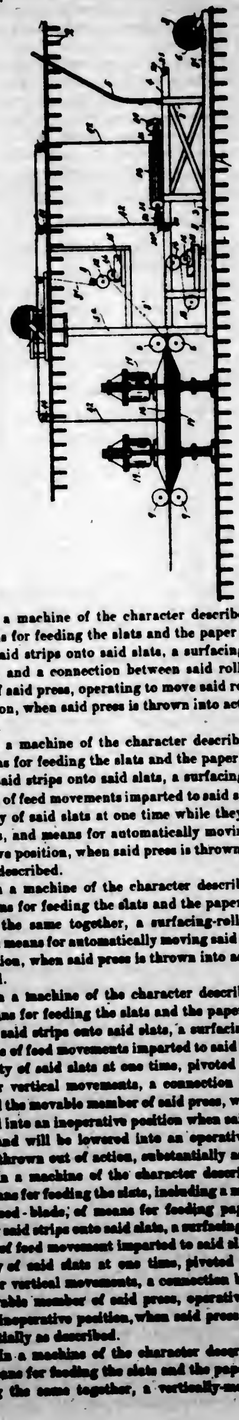
4. The combination, in a dry battery, of a series of zinc cups in form of sectors of a cylinder, non-conducting partitions separating the same, a porous carbon pencil at the middle part of each cup, and a filling of porous material saturated with an acid solution between the pencil and cup, and metallic connections between the cup of one cell and the carbon of the next cell, all combined.

5. In a dry battery, an inclosing cylindrical casing, a series of zinc cups in form of sectors of a cylinder inclosed in said casing, insulating-partitions between the cups, a carbon pencil centrally supported in each cup and a porous body saturated with said filling the interval, metallic connections from the zinc of one cup to the carbon of the next cell in series, a non-conducting plastic covering for each of the cells, and suitable terminals, all combined.

808,756. **COMPO-BOARD MACHINE.** CHARLES J. JOHNSON and WILLIAM B. PORTER, Minneapolis, Minn. Filed June 21, 1905. Serial No. 266,266.

Claim.—1. In a machine of the character described, the combination with means for feeding the slats, of a press for action on said slats at the assembling-point, a surfacing-roller operative on said slats, and means for automatically moving said surfacing-roller into an inoperative position, when said press is thrown into action, substantially as described.

2. In a machine of the character described, the combination with means for feeding the slats and the paper strips, of a press for pressing said strips into said slats, a surfacing-roller operative on said slats, and means for automatically moving said roller into an operative position, when said press is thrown into action, substantially as described.



3. In a machine of the character described, the combination with means for feeding the slats and the paper strips, of a press for pressing said strips onto said slats, a surfacing-roller operative on said slats, and a connection between said roller and the movable member of said press, operating to move said roller into an inoperative position, when said press is thrown into action, substantially as described.

4. In a machine of the character described, the combination with means for feeding the slats and the paper strips, of a press for pressing said strips onto said slats, a surfacing-roller set obliquely to the line of feed movements imparted to said slats and operating on a plurality of said slats at one time while they are on their way to said press, and means for automatically moving said roller into an inoperative position, when said press is thrown into action, substantially as described.

5. In a machine of the character described, the combination with means for feeding the slats and the paper strips, of a press for pressing the same together, a surfacing-roller operative on said slats, and means for automatically moving said roller into an inoperative position, when said press is thrown into action, substantially as described.

6. In a machine of the character described, the combination with means for feeding the slats and the paper strips, of a press for pressing said strips onto said slats, a surfacing-roller set obliquely to the line of feed movements imparted to said slats and operative on a plurality of said slats at one time, pivoted arms supporting said roller for vertical movements, a connection between said pivoted arms and the movable member of said press, whereby said roller will be raised into an inoperative position when said press is thrown into action, and will be lowered into an operative position when said press is thrown out of action, substantially as described.

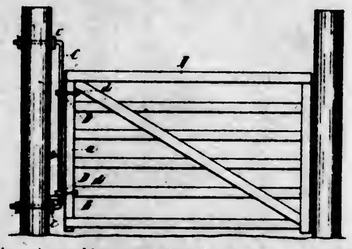
7. In a machine of the character described, the combination with means for feeding the slats, including a magazine and a reciprocating feed-blade, of means for feeding paper strips, a press for pressing said strips onto said slats, a surfacing-roller set obliquely to the line of feed movement imparted to said slats and operating on a plurality of said slats at one time, pivoted arms supporting said roller for vertical movements, a connection between said arms and the movable member of said press, operative to throw said roller into an inoperative position, when said press is thrown into action, substantially as described.

8. In a machine of the character described, the combination with means for feeding the slats and the paper strips, of a press for pressing the same together, a vertically-movable surfacing-roller

operative on the slats while they are on their way to the assembling position, adjustable means for limiting the downward movement of said roller, and means for automatically raising said roller into an inoperative position when said press is thrown into action, substantially as described.

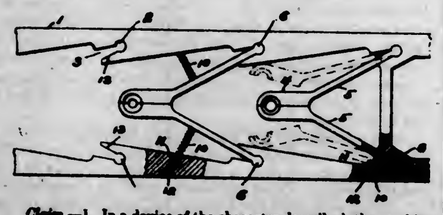
9. In a machine of the character described, the combination with means for feeding the slats and the paper strips, of a press for pressing the same together, a surfacing-roller operative on said slats while they are on their way to the assembling position, pivoted arms supporting said roller for vertical movements, and means for automatically raising said roller into an inoperative position when said press is thrown into action, and for lowering the same into an operative position when said press is thrown out of action, substantially as described.

808,757. GATE-HINGE. JOHN A. JOHNS, Mitchell, Mont. Filed June 17, 1904. Serial No. 212,984.



Claim.—A gate-hinge consisting of a continuous pintle directly attachable to a post and hinge-eyebolts, rotatively mounted on the pintle and attachable to a gate, in combination with a guide and brace piece, having a collar closely fitting upon the pintle below the lower hinge-bolt, and vertically adjustable thereon by means of a set-screw, and of such length as to have the free end in contact with the post.

808,758. CARRIER MECHANISM. LOUIS C. KARL, Waterbury, Conn., assignor to The Waterbury Machine Company, Waterbury, Conn., a Corporation of Connecticut. Filed Apr. 26, 1904. Serial No. 205,627.



Claim.—1. In a device of the character described, the combination with a slide; of fingers pivotally mounted therein and movable between opposing stop-faces.

2. In a device of the character described, the combination with a slide; of fingers pivotally mounted therein and movable between stop-faces; and spring mechanism for moving said fingers in one direction.

3. In a device of the character described, the combination with a slide; of fingers rigid throughout their length pivotally mounted therein and movable between opposing stop-faces; and spring mechanism engaging said slide and fingers for moving said fingers in one direction.

4. In a device of the character described, the combination with a slide; of fingers movable between stop-faces and having a die portion at one end and a knuckle at the other end, said knuckle having a movable engagement with said slide.

5. In a device of the character described, the combination with a slide; of fingers movable between stop-faces and having a die portion at one end and a knuckle at the other end, said knuckle having a movable engagement with said slide; and spring mechanism connected with said slide and engaging said fingers between said die portion and knuckle.

6. In a device of the character described, the combination with a slide; of fingers pivotally mounted therein and movable between opposing stop-faces; and coil-springs engaging said slide at one end and said fingers at the other end for moving said fingers in one direction.

7. In a device of the character described, the combination with a slide; of fingers pivotally mounted therein and movable between opposing stop-faces; and means for preventing the endwise movement of said fingers in said slide.

8. In a device of the character described, the combination with a slide; of fingers pivotally mounted therein; and a pin in said slide for preventing the endwise movement of said fingers in said slide.

9. In a device of the character described, the combination with a slide; of fingers pivotally mounted therein and having a recess in the pivot ends thereof; and a pin in said slide passing through said recess to prevent the endwise movement of said fingers.

10. In a device of the character described, the combination with a slide having semicircular holes therein; outwardly-flaring slots leading into said holes; and fingers pivotally mounted in said holes.

11. In a device of the character described, the combination with a slide having semicircular holes therein; outwardly-flaring slots leading into said holes, the inner faces thereof forming stops; fingers pivotally mounted in said holes; and means for moving said fingers against said stop-faces.

12. In a device of the character described, the combination with a slide having the holes 2 therein at the inner ends of the outwardly-flaring slots 3; studs 8 in said slide and crossing said holes; fingers having a knuckle 6 upon one end thereof rotatably mounted in said holes; and springs 10 engaging said slide and fingers.

808,759. WIRE-STRETCHER. DAVID K. KIRKLAND, Schell City, Mo. Filed Apr. 7, 1905. Serial No. 254,357.

Claim.—In a wire-stretcher, the combination of a lever, an arm pivoted thereto, a second arm pivoted to said lever at a distance from the first arm, the free ends of said arms being bent outward at an angle thereto and having an approximately square cross-section, and claws at the end of said arms formed by first twisting them so as to get a corner or sharp edge upward and then bending the end upward and back so as to form a V-shaped recess, the sides of which are formed by a sharp edge of the bar.

808,760. JEWELRY-CATCH. ROBERT KOLLMAR, Newark, N. J. Filed May 10, 1905. Serial No. 259,796.

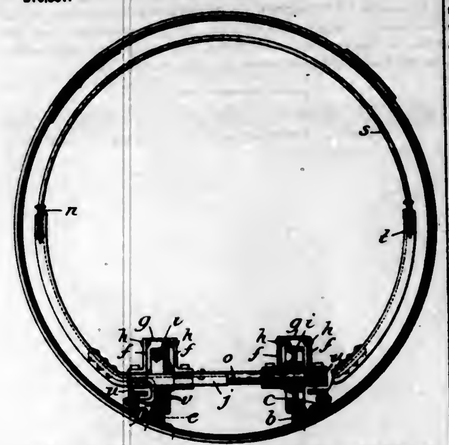
Claim.—1. A jewelry-catch, comprising a hook portion, a spring-wire arranged to close the hook portion, the said wire then being bent to project through the hook, the hook portion having a perforation through which the wire passes and a finger-piece on the end of the spring-wire.

2. The combination with a piece of jewelry and its pin, of a catch arranged to receive the pin, a spring-wire normally closing the catch, a bridge portion on the spring-wire, the back of the hook having a perforation, said bridge passing through the perforation, and a finger-piece on the end of the spring-wire.

3. A jewelry-catch, comprising a hook portion, and a spring-wire secured to the catch and projecting across the open portion of the hook, then bridging the hook portion, the back of the hook portion having a perforation, the free end of the wire passing through the perforation and engaging the outside of the back of the hook to limit the forward movement of the spring-wire.

4. A jewelry-catch comprising a hook portion and a spring-wire secured to the catch and projecting across the open portion of the hook, then being bent to bridge the hook portion and having its end bent to engage the outside of the back of the hook to limit the forward movement of the spring-wire.

808,761. TIE-PRESERVING CYLINDER-CAR. ERNST B. B. KUCKUCK, Charlottenburg, Germany. Filed Aug. 31, 1905. Serial No. 276,557.



Claim.—1. In a car of the class described, the combination of a car-frame consisting of a pair of hollow longitudinally-extending side sills, transverse frame members extending across the opposite ends of such hollow longitudinal side sills connecting them and forming therewith a car-frame, and car-supporting wheels extending into the hollow portion of the side sills for supporting such sills and thereby the car.

2. In a car of the class described, the combination of a car-frame consisting of a pair of longitudinally-extending sills each formed of a pair of angle-irons having upwardly-extending flange portions forming a space therebetween, a top member extending over such space and secured to the upper edges of such flanges, transverse frame members connecting such longitudinal sills, and car-supporting wheels extending into the hollow portions of such longitudinal sills for supporting the car-frame.

3. In a car of the class described, a car-frame having longitudinal sill members provided with spaces therebetween for receiving car-supporting wheels, car-supporting wheels journaled upon and extending between such longitudinal sill members of the car-frame and housed thereby, and channel-beams extending transversely across the car connecting such longitudinal sill members and having upwardly-curved portions at their opposite ends forming side supports for the contents of the car.

4. In a car of the class described, a car-frame having longitudinal side sill members provided with spaces therebetween and having channel-beams secured along the upper edges thereof forming hollow side sills, car-supporting wheels extending into the hollow portion of such side sills, and axles upon which such car-supporting wheels are mounted.

5. In a car of the class described, a car-frame having angle-irons arranged in pairs on opposite sides thereof forming longitudinal sill members and forming spaces between the upwardly-extending flange portions of such angle-irons, channel-irons mounted between and secured to the upwardly-extending flange portions of such angle-irons and forming therewith hollow longitudinal sills having openings at the bottoms thereof, and car-supporting wheels mounted beneath and extending into the hollow portions of such sills.

6. In a car of the class described, the combination of a car-frame consisting of a plurality of hollow longitudinal side sills open at the under side thereof, channel-beams extending transversely of the car secured to and connecting such side sills and each provided with integral upwardly-extending end portions forming side supports for the contents of the car, and supporting car-wheels rotatably mounted and extending into the hollow portions of such hollow side sills.

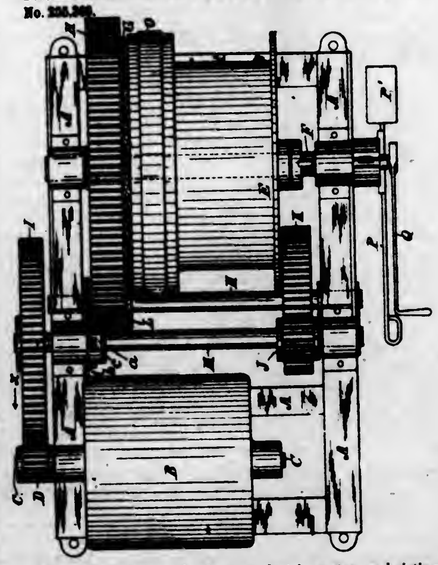
7. In a car of the class described, the combination of a car-frame consisting of hollow longitudinal side sills, transverse frame members connecting such side sills and provided with integral upwardly-extending end portions forming side supports for the contents of the car, axles rotatably mounted upon the longitudinal side sills, and car-supporting wheels mounted upon such axles and extending into the hollow portions of the side sills and housed thereby.

8. In an apparatus of the class described, the combination of a metallic cylinder, track-rails extending longitudinally along the inner surface thereof, a car having a plurality of hollow longitudinal side sills open at the under side thereof, channel-beams extending transversely of the car secured to and connecting such side sills and each provided with integral upwardly-extending end portions curved to correspond with the curvature of the inner surface of the cylinder, and supporting car-wheels mounted upon the track-rails of the cylinder and extending into the hollow portions of such hollow side sills.

808,762. YELLOW ANTHRACENE DYE. MAX KUSS, Wiesdorf, near Cologne, Germany, assignor to Farbenfabriken of Elberfeld Co., New York, N. Y., a Corporation of New York. Filed Sept. 18, 1905. Serial No. 278,943.

Claim.—The herein-described new brownish-yellow dyestuff which can be obtained from 1-3-dibromo-2-amidoanthraquinone, which is a yellow substance soluble in concentrated sulfuric acid with a yellowish-orange color; giving a blue vat with hydrosulfite and caustic-soda lye, which vat dyes unmordanted cotton blue shades, which shades become brownish yellow when exposed to the air, substantially as hereinbefore described.

808,763. AUTOMATIC HOLDFAST FOR ELECTRIC-HOISTER DRUMS. ADRIEN LAMBERT, Newark, N. J. Filed Apr. 13, 1905. Serial No. 255,369.



Claim.—1. A hoister having an electric motor, a hoisting-drum and gearing connecting the electric motor with the drum by a friction-clutch, with one of the intermediate gears revolved upon a stationary shaft, the shaft and hub of the gear having one of them, longitudinally-grooved eccentric seats, and the other having a contiguous cylindrical seat with rolls fitted between the said seats, as and for the purpose set forth.

2. In an electric hoister having the motor connected with the drum by gearing, the combination, with one of the intermediate gear-wheels, of the fixed shaft M' supporting the same, the casing attached rigidly to the shaft and extended over the hub of the gear-wheel, one of the said parts having longitudinally-grooved eccentric seats, and the other having a contiguous cylindrical seat with rolls fitted between the said seats, as and for the purpose set forth.

3. In an electric hoister having the motor connected with the drum by gearing, the combination, with the hoister-frame having the stationary shaft M', of one of the intermediate gear-wheels mounted to turn thereon, the casing a' attached rigidly to the shaft and extended over the hub of the gear-wheel, the bushing f' fitted within the gear-wheel hub to ride upon the shaft and carrying the eccentric seats d' extended within the casing, and the rolls c' fitted between the seats and the casing, as and for the purpose set forth.

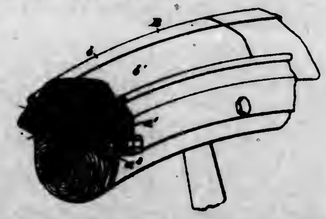
4. In an electric hoister having the motor connected with the drum by gearing, the combination, with the hoister-frame having the stationary shaft M', of one of the intermediate gear-wheels mounted to turn thereon, the casing g' extended over the hub of the gear-wheel and having a boss fitted to the end of the shaft, the boss and shaft being grooved transversely, the cap I having the tongue n fitted to said groove and attached to the casing to hold the same from turning, and the rolls c' fitted between the seats and the casing, as and for the purpose set forth.

5. In an electric hoister, the combination, with an electric motor, of two hoisting-drums E' and E², provided respectively with the gear-wheels H' and H², the pinion L' meshing with both of the said gear-wheels, and an intermediate gear connecting the said pinion with the electric motor and a holdfast applied to the hub of the intermediate gear, whereby each holdfast arrests both of the said drums when the electric motor is stopped.

808,764. BULLETIN FOR MAIL-BOXES. JOHN M. LARSH, Indianapolis, Ind., assignor of one-half to Samuel D. Kiger, Indianapolis, Ind. Filed Feb. 7, 1905. Serial No. 244,631.

Claim.—A post, means for anchoring same, a bulletin-board fastened to the top of the post, a pair of metal bars bolted to the post and a second pair also bolted to the post but lower down than the first pair, and the opposite ends of a bar of each pair being bolted together and to the back of said bulletin-board.

808,765. WHEEL STRUCTURE. JOSEPH LEBWISKA, Detroit, Mich., assignor of one-half to Charles Berg, Cleveland, Ohio. Filed Sept. 10, 1904. Serial No. 223,926.

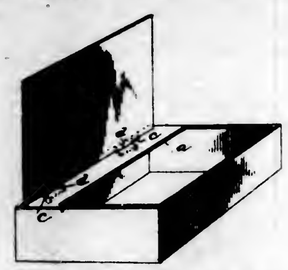


Claim.—1. In a wheel structure, the combination with a suitable rim, of a tire secured thereto and consisting of fibrous material divided into two sections in a plane transverse relatively to the wheel-axis, the fibers of the one portion being inclined, with reference to said plane, in one direction and the fibers of the other portion being inclined in the other direction, said two sections forming the complete tire.

2. In a wheel structure, the combination with a rim having a base-surface consisting of two inwardly-inclined surfaces, of a tire secured thereto resting against said surfaces and consisting of fibrous material divided into two sections on a plane transverse relatively to the wheel-axis, the fibers of each section being substantially perpendicular to the contiguous inclined surfaces of the rim respectively.

3. The wheel structure shown and described consisting of the combination with a suitable rim, of the fibrous tire consisting of the two sections forming the complete tire and separated from each other in a plane transverse relatively to the wheel-axis, said sections having their fibers converging in an outward direction.

808,766. JOINT FOR SHEET METAL AND THE LIKE. ERNST P. LEHMANN, Brandenburg-on-the-Havel, Germany. Filed Oct. 5, 1904. Serial No. 227,516.



Claim.—1. In a joint for sheet-metal bodies and the like, the combination, with a piece provided with lugs projecting from its edges, and a tongue projecting from each lug, of a second piece provided with slots of an extent at least equal to that of the lugs and tongues, the lugs extending through the slots and each tongue occupying a position out of alinement with its respective portion of the slot.

2. In a joint for sheet-metal bodies and the like, the combination, with a piece provided with lugs projecting from its edge, in the same plane, and tongues projecting laterally from the lugs, of a second piece provided with slots of an extent at least equal to that of the lugs and tongues, the lugs extending through the slots and the tongues occupying positions out of alinement with their respective portions of the slots.

3. In a joint for sheet-metal bodies and the like, the combination, with a piece provided with lugs projecting from its edge, and tongues projecting laterally from the lugs, of a second piece provided with slots of an extent at least equal to that of the lugs and tongues, the lugs extending through the slots and the tongues occupying positions out of alinement with their respective portions of the slots and substantially perpendicular to the plane of the second piece.

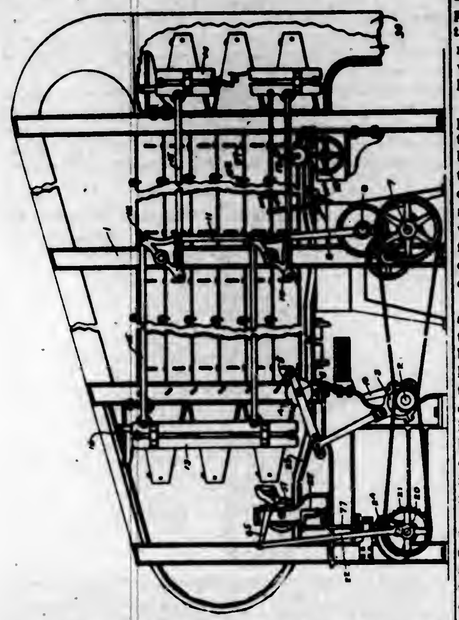
4. In a joint for sheet-metal bodies and the like, the combination, with a piece provided with lugs projecting from its edge, and tongues projecting laterally from the lugs and in the same plane, of a second piece provided with angular slots of a total extent at least equal to that of the lugs and tongues, the lugs extending through the slots and the tongues occupying positions out of alinement with their respective portions of the slots.

5. In a joint for sheet-metal bodies and the like, the combination, with a piece provided with lugs projecting from its edge, and resilient tongues projecting laterally from the lugs, of a second piece provided with angular slots of a total extent at least equal to that of the lugs and tongues, the lugs extending through the slots and the tongues occupying positions out of alinement with their respective portions of the slots.

6. In a joint for sheet-metal bodies and the like, the combination, with a piece provided with lugs projecting from its edge in the same plane, and resilient tongues projecting laterally from the lugs and in the same plane, of a second piece provided with angular slots of a total extent at least equal to that of the lugs and tongues, the lugs extending through the slots and the tongues occupying positions out of alinement with their respective portions of the slots and substantially perpendicular to the plane of the second piece.

808,767. AUTOMATIC MATCH-MAKING MACHINE. GEORGE P. LOCKE, Schenectady, N. Y. Filed Mar. 13, 1905. Serial No. 249,769.

Claim.—1. In a machine of the character described, the combination of a plurality of match-holders, a plurality of track-sections over which the holders are moved, vibrating and swinging supports for transferring the holders from one track-section to another, and a conveyer which receives the holders after they leave the last track-section and automatically conveys them to the beginning of the first section.



2. In a machine of the character described, the combination of a plurality of match-holders, a plurality of track-sections over which the holders are moved, vibrating and swinging supports for transferring the holders from one track-section to another, and a plurality of independent chambers through which the track-sections extend for drying or curing the matches.

3. In a machine of the character described, the combination of a plurality of match-holders, a plurality of track-sections over which the holders are moved, means for transferring the holders from one track-section to another, independent chambers arranged in parallel relation through which the track-sections extend for drying or curing the matches, means common to the chambers for forcing a drying medium through them, and devices in the different chambers for regulating the amount of the drying medium passing through them.

4. In a machine of the character described, the combination of a plurality of match-holders, a plurality of track-sections over which the holders are moved, independent pivoted and vibrating transfer-supports located at the ends of the track-sections and in staggered relation for transferring the holders from one track-section to another, and means for moving the transfer devices.

5. In a machine of the character described, the combination of a plurality of match-holders, a plurality of track-sections over which the holders are moved, a plurality of independent pivotally-supported and vibrating transfer devices located at the ends of each two adjacent sections for transferring the holders from one section to another, and an actuator for each of the transfer devices located at the ends of the track-sections.

6. In a machine of the character described, the combination of a plurality of match-holders, a plurality of track-sections over which the holders are moved, a plurality of independent pivotally-supported and vibrating transfer devices located at the ends of the two sections for transferring the holders from one section to another, an actuator for the transfer devices located at each end of the track-sections, and a driving means common to the actuators.

7. In a machine of the character described, the combination of a plurality of match-holders, a plurality of relatively short track-sections extending in the same general direction, a transfer device for each pair of track-sections, each of said devices comprising a pivotally-supported carriage adapted to receive the holders one at a time and transfer them from one section to another, and a means for rocking each of the carriages about its support to and from one track-section of its pair to the other.

8. In a machine of the character described, the combination of a plurality of match-holders, a plurality of track-sections located one above the other, pivotally supported and vibrating transfer-supports located adjacent to the ends of the pairs of track-sections for transferring the holders from one section to another, means for simultaneously operating all of the transfer devices, and a conveyer which conveys the holders from the upper track-section to the lowest.

9. In a machine of the character described, the combination of a plurality of match-holders, a plurality of relatively short track-sections over which the holders are adapted to move, pivoted and vibrating means located at the ends of the sections for transferring the holders from one to another, a stationary conveyer which receives the holders after they leave the last track-section and automatically conveys them to the beginning of the first section, a device located in the path of the conveyer for discharging the matches from the holders, and a driving mechanism which moves the holders over the track-section and into the conveyer and actuates the match-discharging means.

10. In a machine of the character described, the combination of a plurality of match-holders, a plurality of relatively short track-sections over which the holders are adapted to move, pivoted and vibrating means located at the ends of the sections for transferring the holders from one to another, a stationary conveyer which receives the holders after they leave the last track-section and automatically conveys them to the beginning of the first section, a device located in the path of the conveyer for discharging the matches from the holders, a means located between the said device and the beginning of the first section for reloading the holders, and a driving mechanism which is common to the holders, the discharging device and the reloading means.

11. In a machine of the character described, the combination of track-sections with a device for transferring match-holders from one section to another, the said device comprising a pivotally-supported and vibrating carriage, guides thereon to retain the holder in place while being transferred from one section to another, a projection on the carriage for moving it, and an actuator which engages the projection and swings the carriage about its pivot.

12. In a machine of the character described, the combination of separate track-sections with a device for transferring match-holders from one section to another, comprising a pivotally-supported carriage, a latch for holding the carriage in a raised position until the holder is discharged, and a means for swinging the carriage about its support and for moving the latch to release the carriage after the holder has moved off of it.

13. In a machine of the character described, the combination of separate track-sections, with a device for transferring the match-holders from one section to another, comprising a pivotally-supported carriage having a track thereon to receive the holders, an actuator for swinging the carriage about its pivot to transfer the holders from one track to another, and a means movable with the actuator which engages the holders and moves them forward.

14. In a machine of the character described, the combination of separate track-sections, with a device for transferring the match-holders from one section to another, comprising a pivotally-supported carriage having a track thereon to receive the holders, an actuator for swinging the carriage about its pivot to transfer the holders from one track to another, a means movable with the actuator which engages the holders and moves them forward, and a means which retains one holder while the actuator returns for another holder.

15. In a machine of the character described, the combination of separate track-sections, with a device for transferring match-holders from one section to another comprising short pieces of track inclined to the sections, movable members which slide to and fro, a carriage which is pivotally supported between the ends of the adjacent pieces of track, a means for swinging the carriage about its pivot, and means for first moving the holders toward and then away from the point of support of the carriage.

16. In a machine of the character described, the combination of separate track-sections with a device for transferring match-holders from one section to another, comprising a pivotally-supported carriage, a means for vibrating the carriage about its pivot, means which first move a holder upon the carriage and then move it off, a device for holding the carriage in one of its positions until the match-holder has been moved, and releasing mechanism for the said device which is actuated by the holder-moving means.

17. In a machine of the character described, the combination of a plurality of relatively short independent track-sections, match-holders that move over the sections in end-to-end contact and are

provided with feeding-orifices, pivoted and vibrating supports for transferring the holders from one section to another, and means for positively urging the holders along the track-sections, comprising toothed wheels, the teeth of the wheels entering the orifices in the holders.

28. In a machine of the character described, the combination of perforated match-holders, a plurality of closely-associated pivoted hoppers for receiving the finished matches and discharging them into boxes, swinging doors for the hoppers which are inclined to the walls thereof to cause the matches to align and also to give quick opening, and means for turning the hoppers on their support and opening all of the doors of the hoppers.

29. In a machine of the character described, the combination of a perforated match-holder, a pivotally-supported hopper located under the holder to receive the finished matches, a swinging door for the hopper through which the matches are discharged, the said door being arranged at an angle to the opposite wall of the hopper to cause the matches to fall out at one place and to give a quick opening, and means for swinging the hopper about its pivot and opening the door.

30. A match-making machine comprising perforated match-holders, a plurality of closely-associated pivoted hoppers for receiving the finished matches and discharging them into boxes, swinging doors for the hoppers which are inclined to the walls thereof to collect the matches and open quickly, means for turning the hoppers and their support and opening all of the doors of the hoppers, a conveyer for carrying the match-receiving boxes which is located below the hoppers, and a driving means for advancing the conveyer step by step.

31. In a machine of the character described, the combination of a double tank containing material in a fluid state for treating the match-sticks, a dam in the upper tank for determining the level of the fluid therein, a dipper carried by a pivoted arm for conveying fluid from the lower to the upper tank in excess of that required, a lever for raising the arm and dipper, and a means for moving the arm about its longitudinal axis to empty the contents of the dipper.

32. A match-making machine comprising a plurality of track-sections, holders for the matches arranged to move over the sections, thin partitions for separating the sections and forming chambers one above the other, and supports for the partitions of + shape in section and located at their intersections, to prevent fire from working from one compartment into another.

33. A match-making machine comprising a plurality of track-sections, holders for the matches arranged to move over the sections, a framework for supporting the track-sections comprising + bars, horizontal partitions secured to the inside horizontal webs of the frame-bars, and vertically-disposed removable doors that are secured to the outside of the vertically-disposed webs.

34. In a machine of the character described, the combination of a plurality of track-sections over which the match-holders pass while the matches are being dried, independent chambers for the track-sections, means for supplying drying-currents to the chambers, and means for successively proportioning the strength of the current to the progressive state of the match-heads as to dryness and hardness.

35. In a machine of the character described, the combination of holders for the match-sticks, a plurality of track-sections arranged one above the other over which the holders pass as the matches dry, independent and pivotally-supported devices for transferring the holders from one section to another, parallel-motion actuators, and means for changing the parallel motion of the actuators to vibrating motion of the transfer devices.

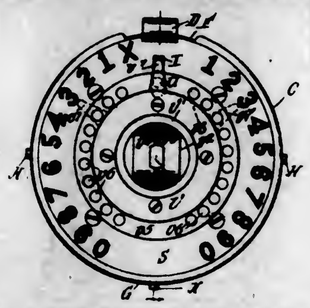
36. A match-making machine comprising a pair of track-sections which are inclined toward each other at the ends, a vibrating support or carriage pivotally supported between said sections, holders for the matches, means causing the holders to move onto the carriage one after the other, a device for vibrating the carriage from one track-section to the other, and means for causing the holders to be discharged one after the other from the carriage.

37. A match-making machine comprising track-sections arranged in a pair, match-holders moving over the sections, a pivotally-supported and vibrating carriage for transferring the match-holders from one section to the other, a means for vibrating the carriage from one section to the other, a latch for retaining the carriage in one of its positions until a holder has made its movement, and a means for releasing the latch when it is desired to move the carriage.

38. A match-making machine comprising a plurality of track-sections, match-holders thereon arranged in end-to-end contact, rollers on the holders arranged to engage with and move over the sections, pivotally-supported vibrating carriages for shifting the holders from one section to another, and a means for vibrating the carriages to shift the holders from one track-section to another.

39. A match-making machine comprising a plurality of straight track-sections, match-holders carried by the sections and arranged in end-to-end contact, pivotally-supported vibrating carriages for transferring the holders from one section to another, a conveyer having curved receiving and discharge portions which receives the holders from the last track-section and conveys them to the first, the holders passing over the conveyer in end-to-end relation with the match-heads extending outwardly so that those on one holder will not strike those on another, and a means for vibrating the carriages and advancing the holders along the track-section and conveyer.

808,768. COMBINED DOOR, LOCK, AND INDICATOR FOR CARRIERS USED IN PNEUMATIC TUBES. PATRICK J. MADIGAN, Chicago, Ill. Filed Feb. 26, 1903. Serial No. 145,209.



Claim.—1. In combination with a carrier of the kind described, a door C pivotally attached thereto; a locking mechanism in said door consisting of the bolts H, levers J, sliding bar L, a handle V attached to said bar and a lug T on the cover of said door; an indicator mechanism on said door consisting of a handle V revolubly supported on the post M on the sliding bar L; a series of holes V^4 in the base of said handle, and a locking-pin U on the cover of said door adapted to be engaged in said holes, a pointer V^7 extending radially from the base of said handle, and a cover S having a series of figures thereon, substantially as described and for the purposes specified.

2. In a device of the kind described, the combination of a door C having parts E and S and being adapted to be pivotally attached to a carrier A; bolts H, connecting-levers J and operating-bar L having a post M, supported in said door; a handle V revolubly supported on said post; a base V^3 forming part of said handle and having a slot V^5, a lug T on the part S of said door adapted to be engaged by said base and to enter said slot; a series of holes in said base and a pin U on the part S adapted to enter said holes and a pointer V^7 forming part of said base of said handle, substantially as described and for the purposes specified.

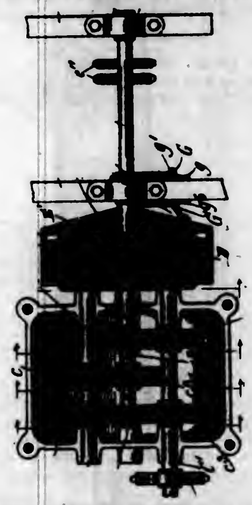
3. In a device of the kind described, the combination of a door C pivotally attached to a carrier A said door being formed of a main body E and a cover S; with a pair of bolts H, connecting-levers J, sliding bar L having a post M and a handle V revolubly attached to said post; said handle having a base provided with a slot and series of holes; a lug on said cover adapted to engage said base, and a pin adapted to enter said holes in said base, substantially as described and for the purposes specified.

4. In a device of the kind described the combination of a door C pivotally attached to a carrier A, said door being formed of the parts E and S; and bolts H, levers J and a sliding bar L having a post M; with a handle adapted to be attached to said post and revolubie thereon, said handle having a base with a slot and series of holes therein; and a lug T, and pin U adapted to be engaged by said base; and a pointer V^7, substantially as described and for the purposes specified.

5. In a device of the kind described, the combination of a door C formed of parts E and S, the part S having a lug T, lock-pin U and series of radial figures; and bolts H, lever J, sliding bar L having a post M and handle V; with a base V^3 forming part of said handle, said base having a slot and series of holes and a pointer substantially as described and for the purposes specified.

808,769. POWER-TRANSMISSION DEVICE. GEORGE W. MARSH, Chicago, Ill. Filed Dec. 15, 1904. Serial No. 237,611.

Claim.—1. The combination with a motor-shaft, of a plurality of pairs of shafts driven therefrom, the shafts of each pair being driven oppositely, a plurality of driving friction members on said shafts, a driven friction member adapted to be engaged by either of the driving friction members of one pair of shafts in driving and of another pair in reversing, a driven shaft, and an operative connection between the same and the driven friction member.



2. In a machine of the class described, the combination with a driving-shaft and an oppositely rotative shaft driven thereby, of a friction-wheel on each of said shafts, a driven friction member inclosing the same and adapted to be engaged and driven by either and mechanism for adjusting the driven friction member into engagement with either of said wheels.

3. In a transmission device the combination with parallel shafts of intermeshing gears thereon, a motor-shaft, positive connection between one of said shafts and said motor-shaft, a driving friction-wheel on each of said parallel shafts, a driven friction member comprising a shell or drum extending over the driving friction-wheels and mechanism adapted to shift the same into engagement with any of the driving friction-wheels.

4. In a transmission device the combination with a plurality of parallel shafts one of which is motor-driven, of intermeshing gears on said shafts rotating the same oppositely, a driving friction-wheel on each shaft, a driven friction member adapted to engage the same, means adjusting the driven friction member into engagement with any driving friction-wheel and operative connection between the driven friction member and the mechanism to be operated.

5. In a transmission device the combination with a motor-shaft and a plurality of shafts geared to rotate oppositely in pairs, of a driving friction-wheel on each of said last-named shafts, one of each pair operating at high speed and the other at low speed, a transmission-shaft, a friction drum or shell rigidly secured thereon and partly inclosing the driving friction-wheels, operative connections between the transmission-shaft and the mechanism to be operated and means adapted to adjust the shell or drum into engagement with any driving friction-wheel.

6. In a device of the class described the combination with parallel shafts of operative connections between the same whereby two of said shafts rotate oppositely from one another at a high and at a low speed respectively, driving friction-wheels on the extremity of each shaft, that on the low-speed shaft being smaller than that on the high, a transmission-shaft, a driven friction member secured thereon and partly inclosing the driving friction-wheels and mechanism adapted to bring any of the driving friction-wheels into operative engagement with the driven friction member and one or more chain-and-sprocket connections between the transmission-shaft and the mechanism to be operated.

7. A transmission device comprising a motor-shaft, parallel shafts driven therefrom, inter-meshing gears acting to drive two of said shafts in one direction and two in the opposite direction and one of each pair at high speed and the other of each pair at relatively low speed, a driving friction-wheel on each of said shafts, those on the low-speed shafts being the smaller, a transmission-shaft, a driven friction member thereon which partly inclosses the driving friction-wheels, adjusting means adapted to shift the driven friction member into engagement with any of the driving friction-wheels whereby the transmission-shaft is driven in either direction and at high or low speed.

8. In a machine of the class described parallel rotatable shafts, a motor-shaft acting to drive one of said shafts, operative connections between the shafts adapted to drive two in one direction and two in the opposite direction, one of the shafts of each pair rotating at slow speed, a small driving friction-wheel on each of the latter shafts, a larger driving friction-wheel on each of the other shafts, a transmission-shaft, a friction shell or drum thereon adapted to extend over and partly inclose the driving friction-wheels, and an adjustable bearing for the transmission-shaft adjacent the friction-shell whereby said shaft is afforded an orbital movement in adjusting the friction-shell to the selected driving friction-wheel and one or more locking-levers adapted to hold said shaft in its adjusted position.

9. In a frictional transmission, the combination with a transmission friction-shell, of a plurality of driving friction-wheels arranged to engage the same, said driving friction-wheels comprising independent low and high speed driving and reverse friction-wheels and mechanism adapted to engage any of said friction-wheels with the friction-shell.

10. In a machine of the class described, high and low speed driving friction-wheels and high and low speed reversing friction-wheels, a driven friction-shell adapted for adjustment into engagement with any selected friction-wheel and adjusting mechanism acting positively to engage the parts in driving relation.

11. The combination with a hollow driven element of continuously-rotating high and low speed driving elements and high and low speed reversing elements engaging within said driven element and adjusting means adapted to engage the driven element with any selected driving element independently.

12. The combination with high and low speed driving friction-wheels and corresponding reversing friction-wheels of a drum adapted to engage any of the same, a shaft driven thereby, a bearing adjacent the drum and means affording an orbital adjustment of said shaft independent of its rotation adapted to adjust said drum into engagement with any selected driving or reversing friction-wheel.

13. The combination with parallel shafts arranged in planes approximately at right angles with each other, of intermeshing gears driving two of said shafts oppositely from the others, a driving friction-wheel on the outer end of each shaft, two of the oppositely-rotating friction-wheels having a low and two a high peripheral speed, a friction-shell partly inclosing all of said friction-wheels, a transmission-shaft secured axially therein, a bearing for said shaft adjacent the shell and means associated therewith adapted to afford an orbital movement for said shaft independent of its rotation and adapting the shell for engagement with any of the friction-wheels and means communicating the motion of the transmission-shaft to the mechanism to be driven.

14. A transmission device comprising rotatable shafts, friction-wheels on corresponding ends thereof, a friction-shell partly inclosing the same, a transmission-shaft axially engaged therein and means adjusting said friction-shell into engagement with any of the driving friction-wheels comprising a bearing for the transmission-shaft, an adjustably-slotted sleeve in which the bearing slides, a lever for rotating said sleeve and means adjusting the shaft in said slot, thereby affording an orbital adjustment of the shaft and shell.

15. In a device of the class described a positively-acting driving friction-wheel, a drum adapted to engage the same and be driven thereby, means adapted to adjust the drum into engagement with the driving friction-wheel comprising a rotatable bearing and a transversely-movable block therein, affording an orbital adjustment for the drum.

16. In a device of the class described, a driving friction element, a driven element, a transmission-shaft engaged thereon, a rotatable diametrically-slotted sleeve on said shaft, a sliding bearing-block in said sleeve, a lever adapted to rotate the sleeve, a lever adapted to move said shaft horizontally in the sleeve and mechanism adapted to vary the altitude of the shaft independently or simultaneously with the partial rotation of the sleeve.

17. The combination with a driven friction member and its transmission-shaft, of means adjusting the friction member and shaft comprising an adjustable bearing at one end of the shaft, orbitally-adjustable bearing near the other end of the same and adjacent

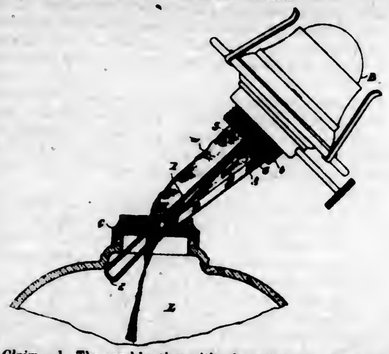
66 OFFICIAL GAZETTE. JANUARY 2, 1906.

JANUARY 2, 1906. U. S. PATENT OFFICE. 67

the friction member and comprising a rotatable slotted sleeve, bearing-blocks slidable therein in which the shaft is journaled, a lever engaged thereon and acting to adjust the sleeve, a horizontally and a vertically acting shifting-lever for the bearing-block, all of said levers being capable jointly of affording an orbital adjustment of the shaft and friction member.

18. In a transmission device, driving friction members comprising high and low speed drive and high and low speed reverse wheels, a transmission-shaft, a friction-shell engaged thereon and partly inclosing said wheels and adapted to be adjusted into driving engagement with either of said wheels.

808,770. LAMP-BURNER. WILLIAM H. MERCHANT, Grinnell, Iowa. Filed May 26, 1905. Serial No. 262,471.



Claim.—1. The combination with a lamp-burner, of supporting members permanently combined therewith and having their free terminals provided with stops, and a channeled wick-support also permanently combined with the burner.

2. The combination with a lamp-burner, of a pair of resilient supporting members permanently combined therewith and provided at their free ends with stops, and a combined gutter and wick support also permanently secured to the lamp-burner and having its free end transversely flattened.

808,771. TYPE-WRITING MACHINE. HENRY W. MERRITT, Syracuse, N. Y., assignor to The Monarch Typewriter Company, Syracuse, N. Y., a Corporation of New York. Filed June 28, 1904. Serial No. 213,227.

Claim.—1. In a type-writing machine, the combination of a platen, an erasing-plate and a paper-finger provided with a latch, said paper-finger being mounted on said erasing-plate, and said latch contacting with said erasing-plate.

2. In a type-writing machine, the combination of a platen, an erasing-plate, and a paper-finger provided with a spring-pressed latch, said paper-finger being mounted on said erasing-plate and said latch being pressed by its spring against said erasing-plate.

3. In a type-writing machine, the combination of a platen, an erasing-plate, a paper-finger mounted on said erasing-plate, and means for positively maintaining a fixed relation between said paper-finger and said erasing-plate.

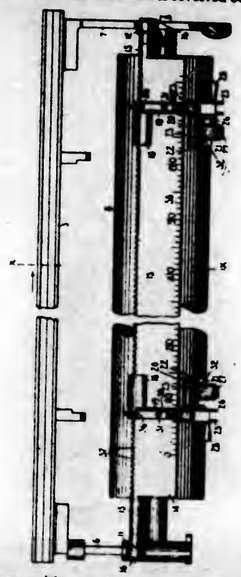
4. In a type-writing machine, the combination of a platen, an erasing-plate, a rack, and a paper-finger, said paper-finger being mounted on said erasing-plate and having a latch engaging said rack.

5. In a type-writing machine, the combination of a platen, an erasing-plate, a rack, and a paper-finger, said paper-finger being mounted on said erasing-plate and having a spring-pressed latch engaging with said rack.

6. In a type-writing machine, the combination of a platen, an erasing-plate provided with a rack, and a paper-finger mounted on said erasing-plate and having a latch engaging with the rack of the latter.

7. In a type-writing machine, the combination of a platen, a toothed member, and a paper-finger provided with a pivoted latch having a spring-pressed finger-piece, said paper-finger being movable longitudinally of said toothed member and being held positively in a fixed relation with said toothed member by the latch of the paper-finger until the latter is swung out of engagement with said toothed member.

8. In a type-writing machine, the combination of a platen, a toothed member and a paper-finger provided with a pivoted latch, said paper-finger being movable longitudinally of and upon said toothed member and being held positively engaged with said toothed member by the latch until said latch is revolved out of the rack.



9. In a type-writing machine, the combination of a platen, an erasing-plate and a paper-finger mounted on said erasing-plate, said paper-finger comprising a supporting part, a feed-roll part and a holding and guiding part.

10. In a type-writing machine, the combination of a platen, an erasing-plate and a paper-finger mounted on said erasing-plate, said paper-finger comprising a supporting part, a feed-roll part and a holding and guiding part, the last two parts being independently pivoted on the first part.

11. In a type-writing machine, the combination of a platen, an erasing-plate and a paper-finger mounted on said erasing-plate, said paper-finger comprising a supporting part, a feed-roll part and a holding and guiding part, the last two parts being independently spring-mounted.

12. In a type-writing machine, the combination of a paper-feeding device and an erasing-plate formed with a blade portion and a toothed portion with which last portion the paper-feeding device coöperates.

13. In a type-writing machine, the combination of a platen, a platen-frame, a paper-finger mounted in said platen-frame, said paper-finger comprising a supporting part, a feed-roll part and a guiding part, the last two parts being independently mounted on the first part, and springs, one of which is associated with each of said last two parts, each spring affecting only the part with which it is associated.

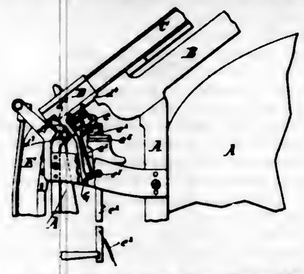
14. In a type-writing machine, the combination of a platen, a platen-frame and a paper-finger rigidly mounted transversely in said platen-frame, said paper-finger carrying an independently-pivoted roll-holder and an independently-pivoted guiding member.

15. In a type-writing machine, the combination of a platen, a supporting-arm, as 19, slidably mounted longitudinally of said platen, a roll-holder pivoted on said supporting-arm and provided with a lug, a spring coacting with said lug, a guiding member, as 21, pivoted on said supporting-arm independently of said roll-holder, and a spring acting solely on said guiding member.

16. In a type-writing machine, the combination of a platen, a platen-frame, a supporting-arm, as 19, slidably mounted longitudinally of said platen, a retaining-latch pivoted on said supporting-arm, a spring coacting with said retaining-latch, a roll-holder pivoted on said supporting-arm and provided with a lug, a spring coacting with said lug, a guiding member, as 21, pivoted on said supporting-arm independently of said roll-holder, and a spring acting solely on said guiding member.

17. In a type-writing machine, the combination of a platen, a platen-frame, a supporting-arm, as 19, slidably mounted longitudinally of said platen, a retaining-latch pivoted on said supporting-arm, a spring, as 36, coacting with said retaining-latch, a roll-holder pivoted on said supporting-arm and provided with a lug, a spring, as 30, coacting with said lug, said spring 30 being integral with said spring 36, and a spring-mounted guiding member, as 21, pivoted on said supporting-arm independently of said roll-holder.

808,772. LINOTYPE-MACHINE. MELVIN W. MOSHMOOSE, Brooklyn, N. Y., assignor to Mergenthaler Linotype Company, a Corporation of New York. Filed Sept. 12, 1903. Serial No. 173,163.



Claim.—1. In a typographic machine, the combination of a main frame, a magazine thereon, a channeled front plate fixed to the frame to receive the released matrices, and an intermediate independently-removable escapement-bar seated on the main frame and provided with escapements and with a depending flange carrying the escapement-spring.

2. In combination, the main frame, the magazine, the coöperating escapement mechanism independently removable, and means distinct from the escapement mechanism to retain the matrices when said mechanism is removed.

3. In combination, the main frame, the magazine seated thereon, and the escapement-bar provided with the escapement mechanism and with the channels, forming continuations of those in the magazine, said bar being independently removable at will, substantially as described.

4. The main frame provided with the magazine, the front channel-plate E and the reeds e^9, in combination with the escapement-bar removably seated on the main frame and provided with the escapements and with the spring-sustaining flange G extended downward between the reeds and the channel-plate, whereby the independent removal of the entire escapement mechanism is permitted.

5. In a linotype-machine, the main frame provided with the magazine and with bearings d^4 and d^5, in combination with the detachable escapement-bar seated on said bearings

6. The escapement-bar channeled for the passage of the matrices and provided with depending flange G, in combination with the escapement-levers having depending arms e^9, and the springs e' secured to the flange and seated on the arms, substantially as shown.

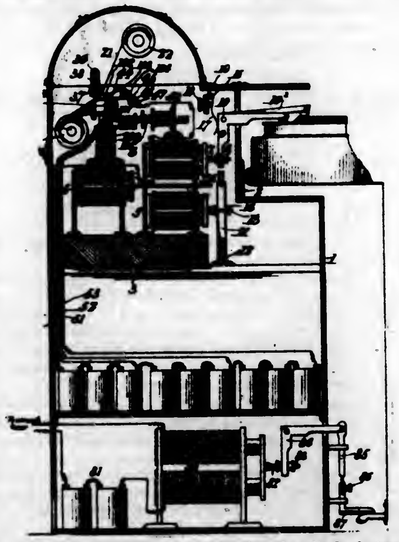
808,773. SURFACE-CONTACT ELECTRIC RAILWAY. GEORGE H. MCFEATERS, Johnstown, Pa., assignor to The Lorain Steel Company, a Corporation of Pennsylvania. Filed Aug. 15, 1904. Serial No. 220,730.

Claim.—1. In an electric contact-box, the combination with an upper fixed electrode, a lower movable electrode, and a flexible conductor connecting the movable electrode with the supply side of the system, of an arc guard or shield, in the form of a thin plate or disk of insulating material, below the movable contact and covering the flexible conductor.

2. In an electric contact-box, the combination with an upper fixed electrode, a lower movable electrode, an armature by which the movable electrode is carried, and a flexible conductor connecting the movable electrode with the supply side of the system, of a thin disk or plate of insulating material secured between the movable contact and the armature, and overlying both the armature and the flexible conductor.

3. In an electric contact-box, the combination with an upper fixed electrode, a lower movable electrode, an armature carrying said movable electrode, and a flexible conductor which connects the movable electrode with the supply side of the system, of an arc guard or shield, in the form of a light plate or disk of insulating material below the movable contact and covering the flexible conductor, together with means for insulating the said armature from the conductor and also from the movable electrode.

808,774. PIANO-PLAYING ATTACHMENT. HUGH MCPHAILL, Visalia, Cal., assignor of one-fourth to Alta McPhaill, one-fourth to Lewis L. Clark, and one-twentieth to Carl H. Holley, Tulare county, Cal. Filed Apr. 12, 1905. Serial No. 255,266.



Claim.—1. In mechanism of the class described, electromagnets for actuating the keys of the instrument, a perforated music-sheet, pivotally-mounted circuit-closers, each having its center of gravity to the rear of the pivot-point, the forward end of each circuit-closer bearing against the strip, and the rear end controlling one of the circuits, a bar extending over the front ends of all of the circuit-closers, and an electromagnetically-operated means for depressing the bar and moving the front ends of all of the circuit-closers down out of contact with the strip.

2. In mechanism of the class described, electromagnets for actuating the keys of the instrument, a perforated music sheet or strip, circuit-closers having their front ends bearing against the strip, and having their rear ends arranged to engage the terminals of the circuits in which said electromagnets are connected, a bar extending over all of the circuit-closers, an electromagnet having a core member connected to said bar, and a circuit in which said electromagnet is connected, said circuit being under the control of the strip.

3. In mechanism of the class described, a perforated music sheet or strip, key-actuating electromagnets, energizing-circuits for said magnets, circuit-closers forming the terminals of said circuits and under the control of said strip, a bar arranged above and normally out of contact with the circuit-closers, an electromagnet having operative connection with said bar, and an energizing-circuit for said electromagnet, the terminals of said circuit being under the control of said strip.

4. In mechanism of the class described, the combination with a perforated music sheet or strip, of key-actuating electromagnets, circuits for such magnets, strip-operated circuit-closers forming the terminals of said circuits, a bar normally held above and out of contact with said circuit-closers, an electromagnet connected to said bar and disposed in a circuit the terminals of which are under the control of the strip, a catch for holding the bar and circuit-closers in depressed

position, and electromagnetically-operated means under the control of the strip for withdrawing the catch and permitting the bar and circuit-closers to assume normal position.

5. In mechanism of the class described, the combination with a perforated music sheet or strip, of key-actuating electromagnets, circuits for said magnets, strip-operated circuit-closers forming the terminals of said circuits, a bar normally held above and out of contact with said circuit-closers, an electromagnet connected to said bar and disposed in a circuit, the terminals of which are under the control of the strip, a spring-pressed catch for holding the bar and circuit-closers in depressed position, out of contact with the strip, a solenoid-core carrying the catch, and a solenoid, the winding of which surrounds said core and is disposed in a circuit also under the control of the strip.

6. In mechanism of the class described, key-actuating electromagnets, circuit-closers connected thereto, a perforated music sheet or strip, strip-carrying rollers arranged one above and the other in front of the circuit-closers, a stationary guide-bar for the strip, and a roller serving in connection with the guide-bar to guide the strip at a point adjacent to the circuit-closers.

808,775. PACKING. JAMES GUTHRIDGE, Indianapolis, Ind. Filed May 26, 1905. Serial No. 262,143.

Claim.—1. A packing composed of alternately-arranged laminæ of corrugated fabric and pliable binding.

2. A packing composed of a multiplicity of alternately-arranged fabric and pliable binding laminæ, each fabric lamina of which has a plurality of transversely-displaced portions which, when subjected to compression in the direction of displacement, will tend to straighten.

3. A packing composed of alternately-arranged laminæ of fabric and rubber, each fabric lamina having portions transversely displaced to form a plurality of corrugations.

4. A packing composed of alternately-arranged laminæ of fabric and rubber, each fabric lamina having portions transversely displaced to form a plurality of corrugations, and the tops and bottom laminæ surfaced with a pliable filling.

5. A packing composed of alternately-arranged laminæ of fabric and pliable binding, each fabric lamina having portions transversely displaced to form a plurality of corrugations, and the top and bottom laminæ surfaced with a pliable filling.

6. A packing composed of a multiplicity of alternately-arranged laminæ of fabric and pliable binding, each lamina having portions transversely displaced to form a plurality of corrugations and the laminæ arranged with intermeshing corrugations.

7. A packing composed of a multiplicity of alternately-arranged laminæ of fabric and rubber, each lamina having portions transversely displaced to form a plurality of corrugations and the laminæ arranged with intermeshing corrugations, and the top and bottom laminæ surfaced with a pliable filling.

8. A packing composed of a multiplicity of alternately-arranged laminæ of fabric and rubber, each lamina having portions transversely displaced to form a plurality of corrugations and the laminæ arranged with intermeshing corrugations.

9. A packing composed of a multiplicity of alternately-arranged laminæ of fabric and rubber, each lamina having portions transversely displaced to form a plurality of corrugations and the laminæ arranged with intermeshing corrugations, and the top and bottom laminæ surfaced with a rubber filling.

808,776. PROCESS AND PRESS FOR PRESSING PULVEROUS MATERIAL. CARL von PITTLER and JOHANN TEUBERT, Brunn, Germany. Filed Sept. 8, 1904. Serial No. 223,393.

Claim.—1. In a press, in combination, a pressing-die, actuating means for said die, coupling means connecting said die and said actuating means, and means for bringing said coupling means into inoperative position while the die is resting on a support inclusive of the material to be pressed.

2. In a press, in combination, a pressing-die, actuating means for said die, coupling means connecting said die and said actuating means, and automatically-operated means for bringing said coupling means into inoperative position while the die is resting on a support inclusive of the material to be pressed.

3. In a press, in combination, a pressing-die, means for actuating said die, automatically-operated means for coupling said die and said actuating means when the die is supported at a certain point, and means for automatically bringing said coupling means into inoperative position when the die is resting at a point above that first named.

4. In a press, in combination, a pressing-die, an actuating member for said die, means for alternately applying low-pressure and high pressure to said die, and automatically-operated means for coupling said die and said actuating member during the ascent of the actuating member after each high-pressure stroke and for holding said parts uncoupled after each low-pressure stroke.

5. In a press, in combination, a pressing-die, a screw-spindle for actuating said die, coupling means connecting said die and said spindle, and means for bringing said coupling means into inoperative position while the die is resting on a support inclusive of the material to be pressed.

6. In a press, in combination, a pressing-die, a screw-spindle for actuating said die, coupling means connecting said die and said spindle, and automatically-operated means for bringing said coupling means into inoperative position while the die is resting on a support inclusive of the material to be pressed.

7. In a press, in combination, a pressing-die, a screw-spindle for actuating said die, means for automatically coupling said die and said screw-spindle while the die is resting at a certain point and for automatically uncoupling said parts when the die is resting at a higher point.

8. In a press, in combination, a pressing-die, a screw-spindle for actuating said die, means for alternately applying low pressure and high pressure to said die through said screw-spindle, and automatically-operated means for coupling said die and said screw-spindle during the ascent of said spindle after each high-pressure stroke and for holding said parts uncoupled after each low-pressure stroke.

9. In a press the combination of a pressing-die, a screw-spindle for actuating same, a hollow in said die adapted to receive the end of said spindle, recesses in said spindle and said die, a coupling member adapted to enter said recesses and means adapted to automatically withdraw said coupling member from the spindle-recesses on depositing the die on a support inclusive of the material to be pressed and on further descending of the spindle.

10. In a press the combination of a pressing-die, a screw-spindle for actuating same, a hollow in said die adapted to receive the end of said spindle, recesses in said spindle and said die, a coupling device adapted to enter said recesses, a controlling member for said coupling device pivotally mounted on the frame of the press and adapted to gradually withdraw said coupling device from the recesses of the spindle on descending of said die and means to turn the controlling member on its pivot on continuation of the descending movement of the die substantially for the purpose described.

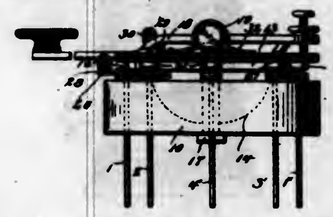
11. In a press the combination of a pressing-die, a screw-spindle for actuating same, a hollow in said die adapted to receive the end of said spindle, recesses in said spindle and said die, the recesses in the die being so positioned that the distance between the recesses and the bottom of the hollow exceeds the distance between the recesses in the spindle and the end of the spindle and a coupling member adapted to simultaneously enter said recesses in the spindle and in the die.

12. In a press the combination of a pressing-die, a screw-spindle for actuating same, a hollow in said die adapted to receive the end of said spindle, recesses in said spindle and said die, the recesses in the die being so positioned that the distance between the recesses and the bottom of the hollow exceeds the distance between the recesses in the spindle and the end of the spindle, a coupling member adapted to simultaneously enter said recesses in the spindle and in the die and means adapted to automatically withdraw said coupling member from the spindle-recesses on depositing the die on a support inclusive of the material to be pressed and on further descending of the spindle.

13. In a press the combination of a pressing-die, a screw-spindle for actuating same and coupling means adapted to throw said die and actuating-spindle at will into engagement and out of engagement while the die is resting on a support inclusive of the material to be pressed a mold, a bottom plate movable in the mold, an ejector-rod pivotally mounted on the under side of the bottom plate, an ejector, connections between the ejector and the spindle, other connections between said ejector-rod and said die, said last-named connections being adapted to hold said ejector-rod out of operative position when the die is in operative position, substantially for the purpose described.

14. In a press the combination of a pressing-die, a screw-spindle for actuating same and coupling means adapted to throw said die and actuating-spindle at will into engagement and out of engagement while the die is resting on a support inclusive of the material to be pressed, a mold, a bottom plate movable in the mold, an ejector-rod pivotally mounted on the under side of the bottom plate, an ejector, connections between the ejector and the spindle, other connections between said ejector-rod and said die, said last-named connections being adapted to hold said ejector-rod out of operative position when the die is in operative position and a guide for said ejector adapted to bring it gradually out of contact with the ejector-rod on rising of the press-spindle substantially for the purpose described.

808,777. TELEGRAPH-KEY. ANDREW B. PETTERSEN, Repton, Ala. Filed Oct. 12, 1905. Serial No. 282,574.



Claim.—1. A telegraph-key comprising a base having a plurality of contacts representing different lines; a turn-table mounted on the base and carrying a key-lever to operate any one of the lines; and means carried by the turn-table to hold the other lines closed.

2. A telegraph-key comprising a base having a plurality of contacts arranged in pairs, and each pair representing a different line; a turn-table mounted on the base and carrying a key-lever to operate any one of the lines; and contacts carried by the turn-table and bearing on those on the base, one of the contacts on the turn-table being in electrical connection with the key-lever, and the others being arranged in electrically-connected pairs.

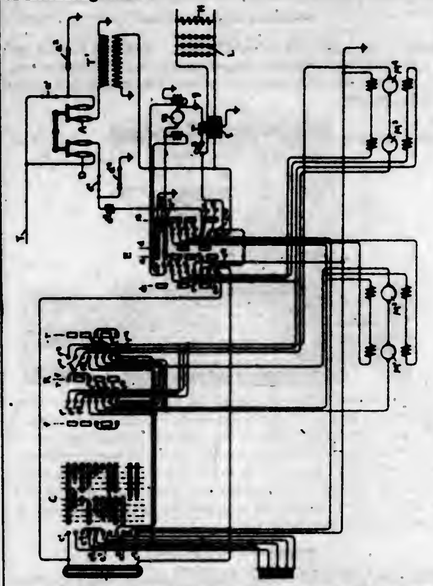
3. A telegraph-key comprising a base having a plurality of contacts arranged in pairs, each pair representing a different line and the members of each pair being disposed diametrically opposite each other; a turn-table mounted on the base and carrying a key-lever to operate any one of the lines; a switch carried by the turn-table and arranged to engage one of the contacts on the base; a contact on the turn-table opposite the switch and bearing on one of the contacts on the base, and electrically connected to the key-lever; and a plurality of contacts carried by the turn-table and bearing on the other contacts of the base, and arranged in pairs each member thereof being diametrically opposite each other and electrically connected.

808,778. MOTOR-CONTROL SYSTEM. WILLIAM B. POTTER, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed Aug. 10, 1904. Serial No. 220,161.

Claim.—1. In combination, a plurality of groups of motors, each group comprising a plurality of motors permanently connected in series, said motors being adapted for operation on either direct or alternating current, means for supplying alternating or direct current to said motors, a switch adapted to connect said groups in series and in parallel and to vary the amount of resistance in the motor-circuit, and a switch adapted to vary the field strength of the motors.

2. In combination, a plurality of groups of motors adapted for operation on either direct or alternating current, means for supplying alternating current or direct current to said motors, a switch for connecting said groups in series and in parallel, and a switch for varying the field strength of the motors.

3. In combination, a plurality of groups of motors adapted for operation on either direct or alternating current, means for supplying direct or alternating current to said motors, a switch for connecting said groups in series and in parallel and for varying the amount of resistance in the motor-circuit, and means for producing a relative variation in the field strength of the motors when running on direct and on alternating current.



4. In combination, a plurality of groups of motors adapted for operation on either direct or alternating current, and means for supplying direct or alternating current to said motors, said means including a switch for varying the field strength of said motors and a switch for connecting said groups in series and in parallel and for determining the amount of resistance in the motor-circuit.

5. In a vehicle, a plurality of motors adapted for operation on either alternating or direct current, a transformer, two switches adapted to connect the source of current to said motors and to the primary of said transformer respectively, and a third switch adapted to vary the field strength of the motors and to connect said motors to the secondary of said transformer.

6. In a vehicle, driving-motors therefor, an auxiliary motor, all of said motors being adapted for operation on alternating or direct current, means for connecting the motors for operation on alternating or direct current, and a switch adapted to connect portions of the fields of all the motors in series and in parallel.

7. In a vehicle, driving-motors therefor adapted for operation on alternating or direct current, means for supplying the motors with alternating and direct currents of different voltages, lamps connected in shunt to the power-circuit, a voltage-changing device, and means for connecting said device in the lamp-circuit when the motors are connected for operation on alternating current.

8. In a vehicle, driving-motors therefor adapted for operation on direct or alternating current, means for supplying direct and alternating current of different voltages to said motors, a voltage-compensator having a point on its winding intermediate its terminals grounded, a lamp-circuit having one terminal connected to the source and the other to one terminal of said compensator, and means for connecting the other terminal of said compensator to the source when the motors are connected for operation on alternating currents.

9. In a vehicle, driving-motors therefor adapted for operation on alternating or direct current, means for supplying the motors with alternating and direct currents of different voltages, lamps connected in shunt to the power-circuit, a voltage-changing device, and a switch for decreasing the field strength of the motors and including said compensating coil in the lamp-circuit for operation on alternating current.

10. In combination, a plurality of motors adapted for operation on either alternating or direct current, a controlling-switch for said motors, a blow-out coil therefor, and means for cutting said coil out

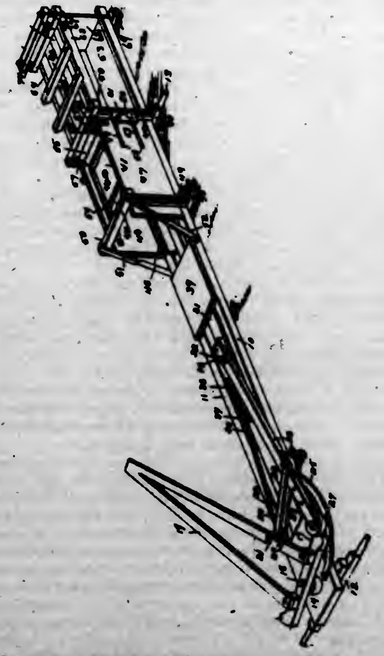
of circuit when the motors are connected for operation on alternating-current.

11. In combination, a plurality of motors adapted for operation on either alternating or direct current, a controlling-switch for said motors, a blow-out coil therefor, and a switch arranged to vary the field strength of the motors and to cut said coil out of circuit.

808,779. ELECTRIC GENERATOR. BENJAMIN P. REMY and FRANK I. REMY, Anderson, Ind., assignors to Remy Electric Company, Anderson, Ind., a Corporation of Indiana. Filed May 27, 1905. Serial No. 262,602.

Claim.—In an electric generator, the combination, with stationary poles, of a pair of annular segmental poles journaled within said stationary poles and provided at the ends with journal-bearings, an armature mounted within said annular poles and having shaft-sections journaled and supported in the journal-bearings of the annular poles, means by which the armature may be angularly moved within the annular poles, and means by which the annular poles may be shifted within the stationary poles.

808,780. BALING-PRESS. JAMES R. ROBINSON, Dublin, Ga. Filed July 26, 1904. Serial No. 218,015.



Claim.—In a baling-press, the combination of a baling-chamber having sills fixed with respect thereto, a reciprocatory plunger having a cross-head disposed between the sills, a power-stand, a horizontally-swinging pitman pivoted to the plunger and having an anti-friction-roller extending beyond its forward end, a tractile spring connecting the power-stand and the pitman, a horizontally-rotatable cross-head mounted on the power-stand and having rounded ends arranged to engage the roller of the pitman and also having a sweep, a curved track fixed with respect to the power-stand, a horizontally-swinging arm pivotally connected with the power-stand and the pitman and movable on said track, a leaf-spring connected at its rear end to one of the sills and having its forward portion disposed between the sills in position to be engaged by the cross-head, and a coiled spring interposed and supported between the forward portion of the leaf-spring and the sill to which said leaf-spring is connected.

808,781. WATER-COOLER. GEORGE B. SAVAGE, Meriden, Conn. Filed May 2, 1904. Serial No. 206,869.

Claim.—1. In a water-cooler, the combination of a body portion having thermally-insulated side walls and forming an ice-chamber, a double bottom, a glazed or enameled reservoir, an outlet-pipe from the body portion having an upwardly-turned inner end extending upward through the inner bottom and the bottom of said reservoir, means for centering said reservoir and a set-nut for coacting with the upwardly-turned end of said outlet-pipe for securing said reservoir in place, a cover for said body portion having an opening and an inverted bottle supported with its outlet within said reservoir.

2. A water-cooler comprising the combination of a body portion with insulated side walls having a shoulder near the top and an opening, a wide-mouthed water-reservoir mounted in said body, a single separate cover for said body portion and said reservoir having double metallic walls spaced apart with insulating material filled therein, said cover rising in the form of an arch from a shoulder of said body portion and having an annular flange or rim surrounding a central opening and an inverted water-bottle having a shoulder supported by said flange, the neck of said bottle protruding freely and unsupported within the mouth of said water-reservoir, the weight of said water-bottle being borne by said arched cover.

808,782. FLUID PIPE-LINE. JAMES B. STRAUB, Berkeley, Cal., assignor to Riffed Pipe Company, San Francisco, Cal., a Corporation of California. Filed June 23, 1905. Serial No. 266,567.

Claim.—1. A pipe-line having an interior helically-directed obstruction for the piping of a fluid, according to the method stated, said line, when laid on a grade, having traps at intervals in its bottom, for the collection of the heavier fluid of the pipe content, when the pumping is discontinued.

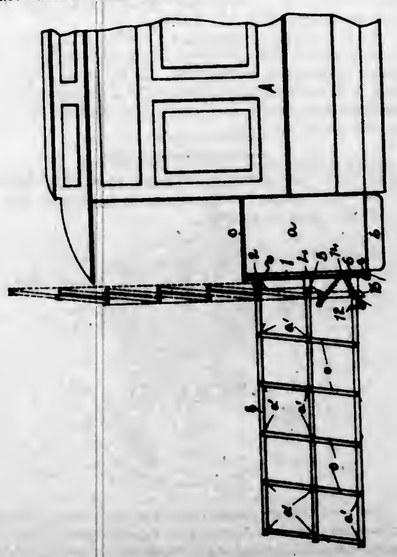
2. A pipe-line having an interior helically-directed obstruction for the piping of a fluid, according to the method stated, said line, when laid on a grade, being depressed below its general grade, at intervals, to form traps for the collection of the heavier fluid of the pipe content, when the pumping is discontinued.

3. In an apparatus for the method stated and in combination with means for supplying the pipe-line with the two fluids, a pipe-line laid on a grade and having traps for the collection of the heavier fluid of the pipe content, when the pumping is discontinued.

4. In an apparatus for the method stated and in combination with means for supplying the pipe-line with the two fluids, a pipe-

line laid on a grade and depressed below its general grade, at intervals, to form traps for the collection of the heavier fluid of the pipe content, when the pumping is discontinued.

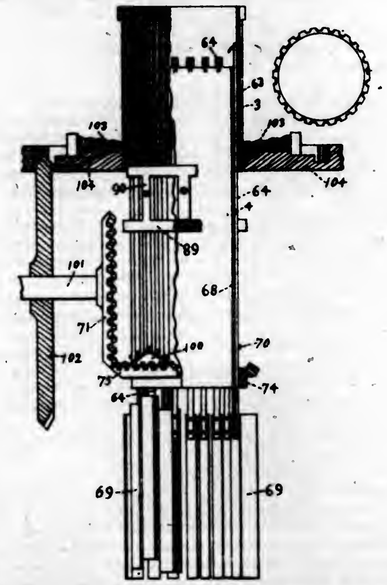
808,783. TRAILING FENDER. ERNST G. SOLOMON, Omaha, Nebr., assignor of one-half to Harrison B. Shedd, Ashland, Nebr. Filed Nov. 20, 1903. Serial No. 183,006.



Claim.—1. A car-fender adapted to be secured to the rear end of a car, comprising a pivotally-held supporting-bar, of a plurality of fender-bars pivotally secured to said supporting-bar, said fender-bars being normally adapted to be held in a horizontal position, a plurality of vertical bars pivotally securing said fender-bars to provide an approximately rectangular frame, and a spring to normally hold said frame in alinement with the car, all arranged substantially as and for the purpose set forth.

2. A car-fender adapted to be secured to the rear end of the car, comprising a pivotally-held supporting-bar, of a plurality of fender-bars pivotally secured to said supporting-bar said fender-bars being adapted to be normally held in a horizontal position, means to connect said fender-bars, and a spring to normally hold said frame in alinement with the car.

808,784. KNITTING-MACHINE. BERNARD T. STERER, Utica, N. Y. Filed Oct. 15, 1904. Serial No. 228,669.



Claim.—1. In a knitting-machine the combination of a series of web-holding hooks, a cam having an inclined surface for directly raising them, and an annular revoluble holder for carrying said cam, beneath a portion of the needle-cam cylinder opposite the needle-actuating cam, substantially as specified.

2. In a knitting-machine the combination of a series of web-holding hooks, a cam having an inclined cam-surface for raising them, and a beveled gear for carrying said cam underneath projecting lugs reaching outward from the web-holders located beneath a portion of the needle-cam cylinder opposite the needle-actuating cam.

3. In a knitting-machine the combination of a series of web-holding hooks, a cam having an inclined surface for raising them by direct contact, and a miter-gear for carrying said cam, a main driving-shaft employing a beveled gear to transmit motion to the needle-operating cam-ring and a miter-gear to transmit motion to the web-holder cam, substantially as specified.

4. In a knitting-machine the combination with a series of web-holding hooks, said hooks having portions to reach over the path of their actuating-cam, of an actuating-cam mounted upon the upper surface of an annular cam-holder, and means for moving said actuating-cam in such a manner that it will raise first one hook then its immediate neighbor and so on continually raising the hooks in consecutive succession, substantially as specified.

5. A web-holding mechanism for knitting-machines comprising a series of web-holders, means for normally pulling them downwardly and a cam engaging said holders, and capable of lifting them consecutively.

6. In a knitting-machine a web-holder comprising hooks capable of engaging the web, means for pulling them downwardly, and means for lifting them consecutively.

808,785. INVALID-LIFT. OSMER B. THOMPSON, Jenny, Ohio. Filed July 20, 1904. Serial No. 217,516.

Claim.—1. In an invalid-lift, the combination with a raising device and a supporting-frame connected to the raising device, of a plurality of cloth bottom sections disposed across the frame, stripe about which the opposite ends of the sections are folded, and means engaged about the strips and folded ends of the sections for connecting the same to the sides of the frame and placing the sections under tension.

2. In an invalid-lift, the combination with a raising device and a supporting-frame connected to the raising device, of a plurality of cloth bottom sections disposed across the frame, stripe about which the opposite ends of the sections are folded, and hooks engaged about the strips and folded ends of the sections for connecting the same to the sides of the frame and placing the sections under tension.

3. In an invalid-lift, the combination with a raising device and a supporting-frame connected to the raising device, of a plurality of cloth bottom sections disposed across the frame, non-flexible strips about which the opposite ends of the cloth sections are folded, and hooks formed to receive the strips and folded ends of the sections and adapted to engage over the sides of the supporting-frame so as to stretch the sections across the same.

4. In an invalid-lift, the combination with a raising device and a supporting-frame connected to the raising device, of a plurality of cloth bottom sections disposed across the frame, strips about which the opposite ends of the cloth sections are folded, the said strips adapted to be engaged with the sections at different points so as to vary their length between their folded portions, and means engaged about the strips and folded ends of the sections for connecting the same to the sides of the supporting-frame.

5. In an invalid-lift, the combination with a supporting-frame, a textile bottom section disposed across the frame, and means for supporting one end of the section from the frame, of means for supporting the opposite end of the section from the frame comprising a strip about which the said end portion of the section is closely folded, and a supporting device having one end snugly engaged about the folded end of the section and the strip and its opposite end in engagement with the frame.

808,786. POLISHING-MACHINE FOR SAD-IRONS. OLE TYRDAHL, Mineral City, Ohio, assignor of one-half to Thomas J. Rittenhouse, Coshocton, Ohio. Filed Feb. 3, 1905. Serial No. 243,866.

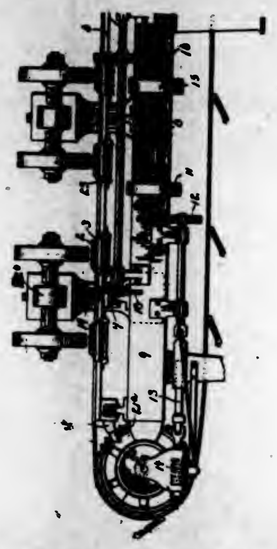
Claim.—1. In a polishing-machine, in combination, a polishing-wheel, a traveling holder for the article to be polished, and means to move the holder laterally and longitudinally across the wheel.

2. In a polishing-machine, in combination, a polishing-wheel, a belt carrying holders for the articles to be polished, and means to press said articles against the wheel, said belt having a reciprocating lateral motion, in addition to its longitudinal run.

3. In a polishing-machine, in combination, a frame, a series of polishing-wheels overhanging the same, a belt which travels over the frame and under said wheels, article-holders carried by the belt, and means to lift the holders to press the articles against the wheels.

4. In a polishing-machine, in combination, a frame, a series of polishing-wheels overhanging the same, a track on the frame, under the wheels, a belt which travels along said track, holders carried by the belt, and means beside the track, under each wheel, to lift the holders, to press the articles carried thereby against the wheels.

5. In a polishing-machine, in combination, a series of polishing-wheels, a track thereunder, laterally-reciprocating carriages which support the track, a belt which runs along the track and moves laterally therewith, and holders for the articles to be polished, attached to the belt and movable therewith under the wheels.

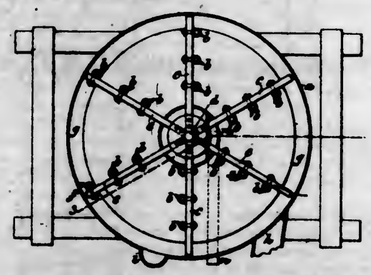


6. In a polishing-machine, the combination of the polishing-wheel, the belt which travels thereunder, the holders carried by the belt, and means to yieldingly lift the holders as they pass under the wheel, to press the articles therein against said wheel.

7. In a polishing-machine, in combination, a frame, laterally-movable wheels at the ends thereof, a belt which runs around said wheels and over the frame, means to reciprocate the belt and wheels laterally, a series of polishing-wheels mounted over the frame and belt, and holders carried by the belt and constructed to carry articles under and against the polishing-wheels.

8. In a polishing-machine, the combination with a polishing-wheel, of a track thereunder, a belt which travels along the track, holders supported on the belt, lifting-slides arranged beside the track, upon which the holders ride as they pass under the wheel, to press the articles carried thereby against the wheel, and weighted levers supporting said slides.

808,787. APPARATUS FOR TREATING AND AMALGAMATING METALS. GEORGE P. TYARS, Cape Town, Cape Colony. Filed Aug. 8, 1904. Serial No. 219,892.



Claim.—1. The combination of a vessel for treating and amalgamating ores, a shaft in the vessel carrying arms, paddles depending from the arms and arranged in a spiral around the vessel, the blades of the paddles being set at the same angle to the radii of the arms and so arranged that the leading edge of any blade traces out the same path as the outer rear edge of the preceding one, and a channel extending around the outer edge of the bottom of the vessel.

2. A vessel for treating and amalgamating ores, a shaft in the vessel carrying arms, paddles arranged in a spiral on the arms the blades of the paddles being set at the same angle to their radii and so arranged that the leading edge of any blade traces out the same path as the outer rear edge of the preceding one except the outermost blade which is turned toward the outer wall of the vessel, and a channel extending round the outer edge of the bottom of the vessel.

3. A vessel for treating and amalgamating ores, a shaft in the vessel carrying arms, paddles arranged in a spiral on the arms the blades of the paddles being set at the same angle to their radii and so arranged that the leading edge of any blade traces out the same path as the outer rear edge of the preceding one except the outermost blade which is turned toward the outer wall of the vessel, and a channel extending round the outer edge of the bottom of the vessel the two outermost blades protruding into the channel.

808,788. GARMENT-MARKER FOR LAUNDRIES AND THE LIKE. DUTLEY C. VOSS, Somerville, Mass., assignor to John B. Bartlett, Chelsea, Mass. Filed Apr. 26, 1905. Serial No. 257,247.

Claim.—1. A garment-marker, comprising a flexible strip of woven fabric, having at its opposite ends eyelets permanently secured thereto, and provided with securing prongs or clamps for piercing the fabric and being bent back into the holes of the eyelets.

2. A garment-marker, comprising a flexible strip of woven fabric cut on the bias and comprising a plurality of folds secured to each other, having at its opposite ends eyelets permanently secured thereto, and provided with securing prongs or clamps for piercing the fabric and being bent back into the holes of the eyelets.

3. A garment-marker, comprising a flexible strip of woven fabric cut on the bias and comprising a plurality of folds secured to each other by waterproof cement, having at its opposite ends eyelets permanently secured thereto, and provided with securing prongs or clamps for piercing the fabric and being bent back into the holes of the eyelets.

4. A garment-marker, comprising a multifolded bias strip cemented with waterproof cement, and having at each end a prong-carrying eyelet, said eyelet having an outwardly-curved annular pocket at one end of its central hole, and a rolled-over edge at the opposite end of said central hole, said edge inclosing the material and pinching the same into said pocket.

5. A garment-marker, comprising a cloth portion for receiving the writing or laundry-mark, and an eyelet provided with opposite prongs, said eyelet having a flat peripheral rim, an outturned annular pocket adjacent thereto, converging into a central tubular portion terminating at the opposite side in a rolled-over edge, said edge interlocking with the cloth and pinching the same into said annular pocket.

808,789. METALLIC STUDDING. FREDERICK VOSS, Chicago, Ill. Filed Feb. 11, 1905. Serial No. 245,269.

Claim.—1. The combination in a stud of a central web, a loop thereon and a corrugated rib adjacent said loop.

2. A stud comprising a central web, a loop offset from the plane thereof and a corrugated portion adjacent said loop and directed toward the same.

3. A metallic studding comprising a web, a laterally-directed flange thereon, a loop adjacent said flange and directed oppositely therefrom and a deflecting-rib adjacent said loop having the adjacent portion thereof turned out of the plane of the web toward the loop.

4. A metallic studding comprising a central web, laterally-directed flanges thereon, integral loops in said web projecting outwardly from the plane thereof and a deflecting-rib adjacent said loops.

5. A device of the class described comprising a central web, a plurality of oppositely-directed loops therein arranged in pairs and a deflecting-rib intermediate said loops.

6. In a device of the class described the combination with a central web of oppositely-directed flanges thereon, a plurality of loops adjacent each flange and directed oppositely therefrom and a corrugated deflecting-rib intermediate laterally-adjacent loops.

7. A device of the class described comprising a central web, laterally-directed flanges thereon, means on said web adapted to receive fastening means and means adjacent thereto adapted to direct the fastening means on the proper side of said web.

8. A device of the class described comprising a central web, a laterally-directed flange thereon, a loop integral with said web adapted to firmly grip a nail or the like and a corrugated portion adjacent said loop.

9. In a device of the class described the combination with a central web of lateral, oppositely-directed flanges thereon, a row of longitudinally-alined loops adjacent each flange and directed oppositely therefrom and a rib intermediate laterally-adjacent loops having the edges thereof turned oppositely out of the plane of the web.

10. A metallic stud comprising a central web having outwardly-directed loops extending longitudinally thereof at closely-arranged intervals along its length affording means for attaching grounds and a longitudinal corrugation in the web adjacent said loops.

808,790. WOVEN FEATHER FABRIC. EDWARD K. WARREN and JONAS H. HOLDEN, Three-oaks, Mich., assignors to The Warren Featherbone Company, Three-oaks, Mich. Filed Sept. 12, 1903. Serial No. 173,016.

Claim.—A fabric made up of an open-mesh base fabric, into the meshes of which down or feathers are incorporated and felted or compacted together.

808,791. FELTED FEATHER FABRIC. EDWARD K. WARREN and JONAS H. HOLDEN, Three-oaks, Mich., assignors to The Warren Featherbone Company, Three-oaks, Mich. Filed Sept. 12, 1903. Serial No. 173,911.

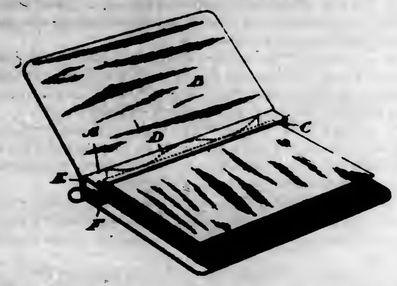
Claim.—A felt fabric consisting of the down or plumage of feathers felted together.

808,792. FELTED FEATHER FABRIC. EDWARD K. WARREN and JONAS H. HOLDEN, Three-oaks, Mich., assignors to The Warren Featherbone Company, Three-oaks, Mich. Filed Sept. 12, 1903. Serial No. 173,912.

Claim.—1. A felt fabric consisting of feather plumage felted together, and having rows of stitching through the same.

E. A felt fabric consisting of feathers felted together, having crossed rows of stitching through the same.

808,793. TEMPORARY BINDER. CHARLES WHITHAM, Sheffield, Canada. Filed Oct. 14, 1904. Serial No. 228,431.



Claim.—1. In a binder, provided with a retaining-bar, a lock for the said bar, comprising a plate having a bayonet-slot formed therein; and a locking-piece hinged on a stationary part and adapted to close the main part of the slot and releasably retain the end of the retaining-bar in engagement with the shoulder of the slot, whereby the bar is held down by engagement with the said shoulder and not by the locking-piece substantially as described.

2. In a binder, provided with a retaining-bar, a lock for the said bar, comprising a plate having a bayonet-slot formed therein, with a downwardly-facing notch in its shoulder; and a locking-piece hinged on a stationary part and adapted to releasably retain the end of the retaining-bar in engagement with the shoulder, whereby the bar is held down by engagement with the said shoulder and not by the locking-piece substantially as described.

3. In a binder, provided with a retaining-bar, a lock for the said bar, comprising a plate having a bayonet-slot formed therein; and a locking-piece hinged on a stationary part and adapted to close the main part of the slot; a stem longitudinally movable in the locking-piece, and having an enlargement thereon; a spring tending to maintain the stem in its normal position, the plate having a slot cut therein for the passage of the stem and an enlargement of the slot to receive and engage the enlargement of the stem when the locking-piece is in its locking position, substantially as described.

4. In a binder, provided with a retaining-bar, a lock for the said bar, comprising a plate having a bayonet-slot formed therein and a keyhole-slot below the bayonet-slot; a locking-piece pivoted behind the plate and shaped to close the vertical part of the bayonet-slot; a stem longitudinally movable in the locking-piece and having an enlargement near its outer end; and a spring tending to maintain the stem with its enlargement in position to engage the enlargement of the keyhole-slot when the locking-piece is swung to close the bayonet-slot, substantially as described.

5. In a binder, provided with a retaining-bar, a lock for the said bar, comprising a plate having a bayonet-slot formed therein and a keyhole-slot below the bayonet-slot; a locking-piece pivoted behind the plate and shaped to close the vertical part of the bayonet-slot; a stem longitudinally movable in the locking-piece and having an enlargement near its outer end; a spring tending to maintain the stem extended with its enlargement in position to engage the enlargement of the keyhole-slot when the locking-piece is swung to close the bayonet-slot; and a ring secured to the end of the stem, substantially as described.

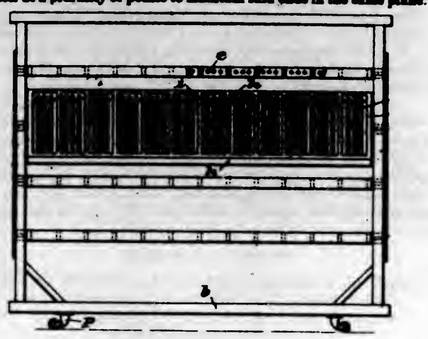
808,794. SHOE-RACK. EDWARD F. WHITE, Quincy, Mass. Filed Jan. 26, 1905. Serial No. 242,488.

Claim.—1. A shoe-rack having a plurality of independent pivoted reversible shelves and means for maintaining either face of each shelf in supporting position.

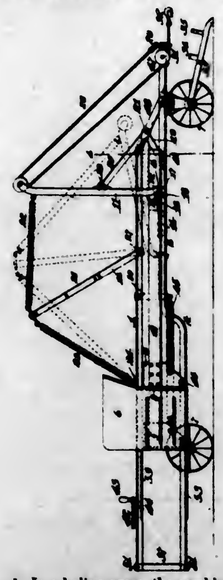
2. A shoe-rack provided with a plurality of independent shelves having shoe-holding compartments upon opposite faces and adapted to present either face in supporting position.

3. A shoe-rack comprising a supporting-frame having a plurality of pivotally-reversible shelves and means to engage said shelves when in normal position to maintain them therein and to prevent them from warping.

4. A shoe-rack comprising a supporting-frame having a plurality of reversible shelves pivoted thereto and means extending from the frame and adapted to engage each of the opposite ends of each shelf at a plurality of points to maintain said ends in the same plane.



808,795. BALING-PRESS. EDGAR L. WHITE, Waco, Tex. Filed June 30, 1903. Serial No. 163,782.



Claim.—1. In a baling-press, the combination with a plunger, plunger-rod, and plunger-operating mechanism; of a main frame including a baling-chamber, a frame extension comprising opposite-flanged metallic beams, rollers supporting the plunger, and other rollers supporting the plunger-rod and disposed to travel along the bottom flanges of said beams.

2. In a baling-press, the combination with a press-box and plunger; of plunger-operating mechanism including a lever and lever-retracting mechanism including a pair of springs having their remote ends connected to the lever and to a fixed part respectively, and a swinging arm connecting the proximate ends of said springs.

3. In a baling-press, the combination with a press-box, plunger and plunger-rod; of a swinging fulcrum-support, a plunger-operating lever fulcrumed in said support and disposed to engage the plunger-rod, a swinging arch, a spring connecting said arch with the lever, and a second spring extending between the arch and a fixed part.

4. In a baling-press, the combination with the top members 1, 1 bent outward intermediate their ends for the reception of the baling-chamber, of bottom members 2, 2, bent outward intermediate their ends, for the reception of the baling-chamber and upward near the front ends to form a base or platform for the baling-tongue, substantially as and for the purposes set forth.

5. In a baling-press, the combination with the top members 1, 1 bent outward intermediate their ends for the reception of the baling-chamber, of bottom members 2, 2, bent outward intermediate their ends, for the reception of the baling-chamber and upward near the front ends to form a base or platform for the baling-tongue and brought into close relation at the front extremity to form a sheave-bearing, substantially as and for the purposes set forth.

6. In a baling-press, the combination with the top members 1, 1 bent outward intermediate their ends for the reception of the baling-chamber, of bottom members 2, 2, bent outward intermediate their ends, for the reception of the baling-chamber and upward near the front ends to form a base or platform for the baling-tongue and the inclined members 48 and braces 49, substantially as and for the purposes set forth.

7. In a baling-press, the combination with the top members 1, 1 bent outward intermediate their ends, for the reception of the baling-chamber, of bottom members 2, 2, bent outward intermediate their ends, for the reception of the baling-chamber and upward near the front ends to form a base or platform for the plunger-beam and brought into close relation at the front ends to form a sheave-bearing, and the inclined members 48 and braces 49 with the bearing 21 at the meeting-point thereof, substantially as and for the purposes set forth.

8. In a baling-press, the combination with the framework, plunger-actuating lever and retracting-springs therefor, of the bridge pivoted to the framework, and engaging with the springs intermediate the frame and plunger-actuating lever whereby the angle of lead of the springs will automatically change as the plunger-actuating lever moves, substantially as and for the purposes set forth.

9. In a baling-press, the combination with the framework, plunger-actuating lever and retracting-springs therefor, of a bridge with bifurcated ends pivoted to the framework, and engaging with the springs intermediate the frame and plunger-actuating lever whereby the angle of lead of the springs will automatically change as the plunger-actuating lever moves, substantially as and for the purposes set forth.

10. In a baling-press, the combination with a plunger-beam and actuating-lever, of a spring-detent on the plunger-beam adapted to engage with the plunger-actuating lever, substantially as and for the purposes set forth.

11. In a baling-press, the combination with the plunger-beam and actuating-lever, of a spring-detent upon the beam, and an anti-friction-roller on the lower extremity of the actuating-lever, and adapted to engage with the detent, substantially as and for the purposes set forth.

12. In a baling-press, the combination with the plunger-beam and actuating-lever, supporting-links for the latter, a spring-detent upon the beam and an antifriction-roller on the lower extremity of the actuating-lever and adapted to engage with the detent, substantially as and for the purposes set forth.

13. The combination with the plunger and plunger-beam of a baling-press, of a frame with side members of angle-irons forming a central portion larger in cross-section than the plunger, and contracted inwardly and upwardly adjacent to one end, to form a support for the beam, substantially as and for the purposes set forth.

14. The combination with the plunger and plunger-beam of a baling-press, of a frame with side members of angle-iron forming a central portion larger in cross-section than the plunger, and contracted inwardly and upwardly adjacent to one end, to form a support for the beam, and means for adjustably contracting the other end of the frame, substantially as and for the purposes set forth.

15. In a baling-press, the combination with a press-box and plunger, of a plunger-rod in the form of a channel-beam having a bottom and parallel side flanges, a seat formed between the flanges and an operating-lever having its end extending between the flanges of the plunger-rod and engaging the seat.

808,796. AMUSEMENT DEVICE. THEODORE WHITE, Hartford, Conn. Filed July 9, 1904. Serial No. 215,998.

Claim.—1. In a merry-go-round, in combination, a fixed support, a bearing-plate secured upon the upper end thereof and having a flange, a supporting-plate for a platform mounted on the bearing-plate and having a projection extending about, and underlying the flange, ball-bearings located between said flange and projection, ball-bearings located between the upper surface of the plate and the under surface of the platform-support, and a platform mounted on the support, the plane of the platform and each of the sets of bearings being parallel.

2. In a merry-go-round, in combination, a fixed support to receive a bearing-plate in proximity to the surface of the ground, the bearing-plate secured thereto and having a flange, a support for a platform mounted on the bearing-plate and having a projection underlying the flange, ball-bearings located between said flange and projection, ball-bearings located between the upper surface of the plate and the under surface of the platform-support and a running-board platform dependent from the support in proximity to the ground and a lattice intermediate the platform-support and running-board, providing a casing encircling and guarding the other movable parts.

3. In a merry-go-round, in combination, a fixed support, a plurality of bearings arranged thereon, a rotatable platform mounted upon said bearing, and a dependent running-board extending about the platform whereby a person may gain and retain position upon the platform.

4. In a merry-go-round, in combination, a fixed support, a plurality of bearings operatively arranged thereon, a rotatable platform mounted upon said bearings and provided with a foot or running board extending thereabout and handles projecting from said platform in position to be grasped by a user.

5. In a merry-go-round, in combination, a fixed support, a bearing-plate secured thereto, and having a flange, a platform mounted on the bearing-plate and having a projection underlying the flange, balls located between said flange and projections, and balls located between the upper surface of the plate and the under surface of the platform, a rim depending from the platform and entirely surrounding and inclosing said bearing and supports, and a running-board secured to the lower edge of said rim.

6. In a merry-go-round, in combination, a fixed support, a bearing-plate mounted on the support and having a flange, a rotatable platform having a dependent bearing member with a lip underlying said flange, balls located between said lip and flange, balls located on the upper surface of the plate and between it and the rotatable platform, a supporting-spider forming a part of said platform, radial arms extending from the spider, a rim depending from said platform and entirely inclosing the bearing parts of the device and a running-board secured to the lower edge of said rim.

7. In a merry-go-round, in combination, a support, a bearing-plate fixed to the upper part of said support and having a circular flange, a spider having a depending part with a lip underlying said flange, balls located between said lip and flange, balls located between the upper surface of the plate and spider, radial arms secured at the inner ends in recesses in the spider, a platform mounted on said arms, supports depending from the outer end of the arms, and a running-board secured to the lower end of said supports.

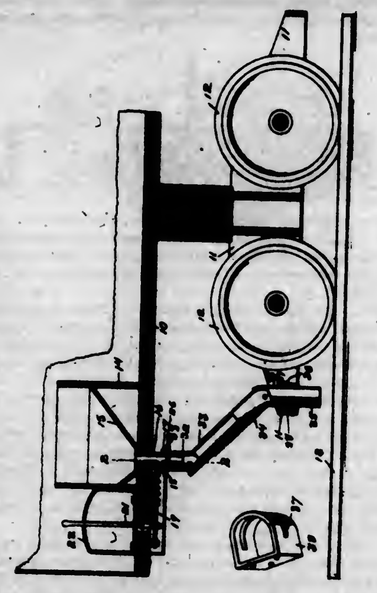
8. In a merry-go-round comprising a fixed support, a plurality of bearings operatively arranged thereon, a rotatable platform mounted upon said bearings and provided with a foot or running board extending thereabout, a seat extending about the entire platform above the running-board, and handles projecting from said platform in position to be grasped and pushed whereby the operator may start the platform in motion and mount the running-board and seat.

9. In a merry-go-round, in combination, a fixed support, a bearing-plate secured to the support and having a circular flange, a spider mounted on the support and having a depending part with a lip underlying the flange, balls secured between said lip and flange, balls located between the under surface of the spider and upper surface of the plate, radial arms with their inner ends located in sockets in said spider, a platform mounted on said radial arms, a rim secured to the outer ends of said arms and extending entirely around the device and entirely inclosing the bearings and a running-board secured at the lower edge of said rim.

10. In a merry-go-round, in combination, a fixed support, a bearing-plate mounted on said support and having a flange, a spider having a depending portion with a lip underlying said flange, balls located between said flange and lip, balls located between the under surface of the spider and upper surface of said bearing-plate, radial arms with their inner ends located in sockets in said spider, a plat-

form located on said arms, supports depending from the outer ends of said arms, a rim extending entirely around the platform and completely guarding the bearings against access and a running-board secured to said supports at the lower edge of the rim.

808,797. TRACK-SANDING APPARATUS. FREDERICK W. WITTENBERG, Des Moines, Iowa. Filed Feb. 27, 1905. Serial No. 247,897.



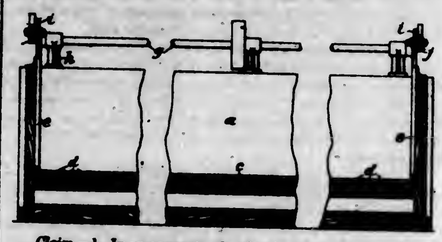
Claim.—1. In a device of the class described a car-floor, a swinging truck connected with the floor, a sand-box mounted adjacent to the floor, a sand-pipe rotatably mounted and communicating with the sand-box, and also rotatably connected with the forward end of the truck, so that the lower end of the sand-pipe is immediately in front of the forward wheels of the truck, and a telescoping portion in the sand-pipe, so arranged that the pipe will be allowed to swing with the swinging of the truck.

2. In a device of the class described a car-floor, a swinging truck connected with the floor, a sand-box mounted adjacent to the floor, a sand-pipe rotatably mounted and communicating with the sand-box, and also rotatably connected with the forward end of the truck, so that the lower end of the sand-pipe is immediately in front of the forward wheels of the truck, and a telescoping portion in the sand-pipe, so arranged that the pipe will be allowed to swing with the swinging of the truck means for regulating the flow of sand from the sand-box through the sand-pipe.

3. In a device of the class described a car-floor, a swinging truck, connected with the floor, a sand-box mounted adjacent to the floor, a sand-pipe rotatably mounted and communicating with the sand-box and also rotatably connected with the forward end of the truck, so that the lower end of the sand-pipe is immediately in front of the forward wheels of the truck means for regulating the flow of sand from the sand-box through the sand-pipe, and a lever and a ratchet-faced portion, to be engaged by said lever for cutting and maintaining the means for regulating the flow of sand through the sand-pipe.

4. In a device of the class described a car-floor, a swinging truck connected with the floor, a sand-box mounted adjacent to the floor, a sand-pipe rotatably mounted and communicating with the sand-box, and also rotatably connected with the forward end of the truck, so that the lower end of the sand-pipe is immediately in front of the forward wheels of the truck, a telescoping portion in the sand-pipe, so arranged that the pipe will be allowed to swing with the swinging of the truck means for regulating the flow of sand from the sand-box through the sand-pipe, a lever and a ratchet-faced portion to be engaged by said lever for cutting and maintaining the means for regulating the flow of sand through the sand-pipe.

808,798. APPARATUS FOR THE AGITATION OF SOLUTIONS USED IN ELECTRODEPOSITION OF METALS. WILLIAM C. WORB and ERNEST GARDNER, London, England, assignors to W. Canning & Co., Birmingham, England. Filed Aug. 31, 1905. Serial No. 276,022.



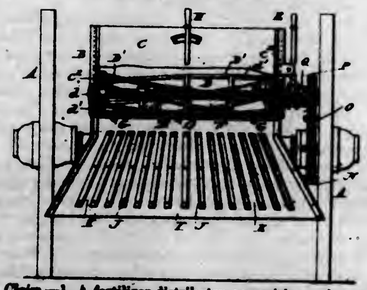
Claim.—1. In an apparatus for the electrodeposition of metals, the combination with the tank for containing the electrolyte of a trough arranged within the same, the said trough having within it a plunger designed for drawing the electrolyte into the trough and ejecting it therefrom, substantially as, and for the purpose, described.

2. In an apparatus for the electrodeposition of metals, the combination with the tank for containing the electrolyte of a trough fixed within the said tank, the said trough containing a plunger provided with holes or apertures through which the electrolyte can enter and be discharged from the trough, substantially as described.

3. In an apparatus for the electrodeposition of metals the combination with the tank adapted to contain the electrolyte, of a trough fixed within said tank adjacent to the bottom of the same and extending substantially from one end of the tank to the other, a plunger fitting said trough, means for admitting the electrolyte to said tank and permitting its escape therefrom, and operating devices for reciprocating said plunger, substantially as described.

4. In an apparatus for the electrodeposition of metals the combination with the tank adapted to contain the electrolyte, of a plurality of troughs fixed in said tank adjacent to the bottom of the same, and extending substantially from one end of the tank to the other, a plunger fitting in each trough, each trough and piston being provided with a series of holes for admitting and expelling the electrolyte, an operating-lever connected with said plungers for operating the same, an operating-shaft, and connections between said shaft and lever, substantially as described.

808,799. FERTILIZER-DISTRIBUTER. ALBERT J. WOOLMAN, Urbana, Ill. Filed May 25, 1905. Serial No. 262,514.



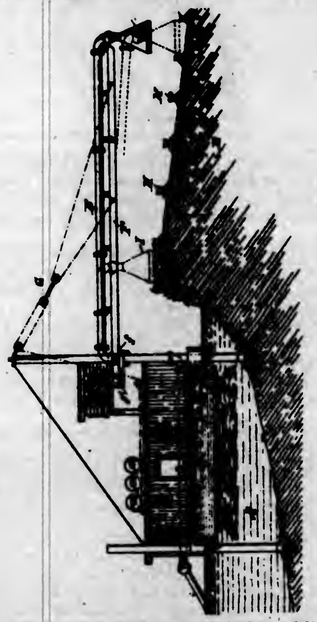
Claim.—1. A fertilizer-distributer comprising a hopper provided with distributing devices and formed with ribs *a* adapted to fit the end-gate groove in the wagon and having standards *a'* adapted to rest on the bottom of the wagon and gearing for connecting distributing devices with a wheel of the wagon.

2. A fertilizer-distributer comprising a hopper having adjustable feed-openings at the bottom and a rotary agitator within the hopper comprising a skeleton frame and diagonally-arranged blades thereon for conveying the material to the feed-openings and for collidding the lumps of material at one end of the hopper.

3. A fertilizer-distributer comprising a hopper, a plate in the bottom thereof having oval or elliptical feed-openings the longer axes of which are arranged crosswise of and diagonally to the longer axis of the hopper and an agitator arranged above the plate and having blades which convey the material to the plate.

4. A fertilizer-distributer comprising a hopper, an agitator therein provided with diagonal blades, a plate in the bottom of the hopper having oval openings the longer axes of which are arranged crosswise of and diagonal to the axis of the agitator and an adjustable sliding plate having corresponding openings for varying the size of the feed-openings.

808,800. LEVEE-BUILDING SUCTION-DREDGE. FRANK V. WRIGHT, San Francisco, Cal. Filed Oct. 9, 1905. Serial No. 281,966.



Claim.—1. In a levee-building suction-dredge, a delivery-pipe disposed above the levee, and suspended from the dredge by connections which enable its discharge end to be swung over the levee in a horizontal arc.

2. In a levee-building suction-dredge, a delivery-pipe disposed above the levee and suspended from the dredge by connections which enable its discharge end to be swung toward or raised from the levee in a vertical arc.

3. In a levee-building suction-dredge, a delivery-pipe disposed above the levee, and suspended from the dredge by connections which enable its discharge end to be swung over the levee in a horizontal arc, and to be swung toward or raised from the levee in a vertical arc.

4. In a levee-building suction-dredge, and in combination with its delivery-pipe, a means in connection with the outlet of said pipe for reducing the velocity of the material at the outlet.

5. In a levee-building suction-dredge, and in combination with its delivery-pipe, a means in connection with the outlet of said pipe for reducing the velocity of the material at the outlet and spreading it at said outlet to a delivery area greater than that of the pipe itself.

6. In a levee-building suction-dredge, and in combination with its delivery-pipe, obstructions in the outlet of said pipe for reducing the velocity of the material at said outlet.

7. In a levee-building suction-dredge, and in combination with its delivery-pipe, obstructions in the outlet of said pipe for reducing the velocity of the material at said outlet consisting of a revolubly-mounted wheel with radial blades rotatable under the pressure of said material.

8. In a levee-building suction-dredge, and in combination with its delivery-pipe, a flaring spreader fitted to the outlet end of said pipe, and obstructions in said spreader for reducing the velocity of the material discharging therefrom.

9. In a levee-building suction-dredge, and in combination with its delivery-pipe, a flaring spreader fitted to the outlet end of said pipe, and obstructions in said spreader for reducing the velocity of the material discharging therefrom consisting of a revolubly-mounted wheel with radial blades rotatable under the pressure of said material.

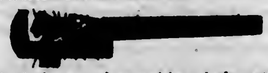
10. In a levee-building suction-dredge, and in combination with its delivery-pipe, a flaring spreader fitted to the outlet end of said pipe, and obstructions in said spreader for reducing the velocity of the material discharging therefrom consisting of a series of independently revolubly mounted wheels with radial blades, the blades of one wheel being inclined oppositely to those of the adjacent wheel, whereby adjacent wheels are rotated in relatively opposite directions by the pressure of the discharging material.

11. In a levee-building suction-dredge, a delivery-pipe disposed above the levee and suspended from the dredge by connections which enable its discharge end to be swung horizontally and vertically over the levee, in combination with a spreader fitted to the outlet of said pipe, and obstructions in the spreader for reducing the velocity of the discharging material.

12. In a levee-building suction-dredge, a delivery-pipe disposed above the levee and suspended from the dredge by connections which enable its discharge end to be swung horizontally and vertically over the levee, in combination with a spreader fitted to the outlet of said pipe, and obstructions in the spreader for reducing the velocity of the discharging material consisting of a revolubly-mounted wheel with radial blades rotatable under the pressure of said material.

13. In a levee-building suction-dredge, a delivery-pipe disposed above the levee and suspended from the dredge by connections which enable its discharge end to be swung horizontally and vertically over the levee, in combination with a spreader fitted to the outlet of said pipe, and obstructions in the spreader for reducing the velocity of the discharging material consisting of a revolubly-mounted wheel with radial blades rotatable under the pressure of said material, consisting of a series of independently revolubly mounted wheels with radial blades, the blades of one wheel being inclined oppositely to those of the adjacent wheel, whereby adjacent wheels are rotated in relatively opposite directions by the pressure of the discharging material.

808,801. PIPE-WRENCH. RICHARD ADAMS, Toronto, Canada. Filed Mar. 7, 1905. Serial No. 248,948.



Claim.—1. A pipe-wrench comprising a body portion having at one end an apertured offset with one of its inner faces serrated and a transversely-disposed chamber extending from the aperture of the offset to the opposite side of the body portion, a movable jaw having a shank with a serrated face to engage with the serrated face of the offset, a spring-tensioned plunger slidable in said chamber to engage said shank, a trigger to actuate the plunger and a fixed jaw for the body portion opposed to the movable jaw.

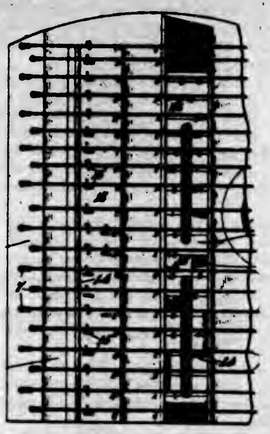
2. A pipe-wrench comprising a body portion having at one end an apertured offset with one of its inner faces serrated and a transversely-disposed chamber extending from the aperture of the offset to the opposite side of the body portion, a movable jaw having a shank with a serrated face to engage with the serrated face of the offset, an annular shoulder in said chamber, a plunger slidably movable in said chamber and through the annular shoulder, a tension-spring engaging said shoulder and plunger to press its head against the shank of the movable jaw, a trigger to actuate the plunger and a fixed jaw for the body portion opposed to the movable jaw.

3. A pipe-wrench comprising a body portion having at one end an apertured offset with one of its inner faces serrated and a transversely-disposed chamber extending from the aperture of the offset to the opposite side of the body portion, a movable jaw having a shank with a serrated face to engage with the serrated face of the offset, a spring-tensioned plunger slidable in said chamber to engage said shank, a trigger to actuate the plunger, a fixed jaw for the body portion opposed to the movable jaw having a rocker contained in a corresponding recess in the adjacent end of the body portion, a lug for the rocker, a tension-spring contained within an extension of said recess engaging said lug and body portion and a rocker-pin passing through the body portion and rocker.

4. A pipe-wrench comprising a body portion having at one end an apertured offset with one of its inner faces serrated and a transversely-disposed chamber extending from the aperture of the offset to the opposite side of the body portion, a movable jaw having a shank with a serrated face to engage with the serrated face of the

chest, an annular shoulder in said chamber, a plunger slidably movable in said chamber and through the annular shoulder, a tension-spring engaging said shoulder and plunger to press its head against the shank of the movable jaw, a trigger to actuate the plunger, a fixed jaw for the body portion opposed to the movable jaw, having a rocker contained in a corresponding recess in the adjacent end of the body portion, a lug for the rocker, a tension-spring contained within an extension of said recess engaging said lug and body portion, and a rocker-pin passing through the body portion and rocker.

808,802. **STRING MUSICAL INSTRUMENT.** FRANK P. ALEXANDER, Lustrgton, Mich. Filed Jan. 20, 1905. Serial No. 242,212.



Claim.—1. The combination of a sounding-board, a plurality of strings stretched thereover between fixed bridges, and a plurality of removable individual bridges or frets for said strings, said individual bridges or frets comprising a wire finger-loop, a laterally-projecting portion and a shank or lower portion, the latter being pivotally mounted intermediate said stationary bridges and said laterally-projecting portions adapted to be swung under said strings for the purpose of varying the length of their vibratory portions and thereby changing their tones.

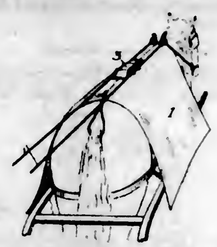
2. A musical instrument comprising a hollow body having a sounding-board, hitch-pins at one end of said body, tuning-pins or keys at its other end, stationary bridges adjacent to each end of said body, strings stretched over said sounding-board and said bridges and engaged with said tuning and hitch pins, and a plurality of removable pivotally-mounted individual bridges or frets for said strings disposed intermediate said stationary bridges said frets consisting of wire finger-loops, a lower pivoted portion, and laterally-projecting portions adapted to be swung under said strings to vary the lengths of their vibratory portions, substantially as described.

3. A musical instrument comprising a hollow body having a sounding-board, hitch-pins at one end of said body, tuning-pins or keys at its other end, stationary bridges adjacent to each end of said body, strings stretched over said sounding-board and said bridges and engaged with said tuning and hitch pins, a plurality of removable pivotally-mounted individual bridges or frets for said strings said bridges or frets each comprising a wire finger-loop, and a lower portion adapted to fit a hole in the sounding-board, said bridges or frets being disposed intermediate said stationary bridges and having portions adapted to be swung under said strings to vary the length of their vibratory portions and a movable chord-indicating chart upon said body, substantially as described.

4. The combination with a stringed musical instrument having adjustable means for varying the length of the vibratory portion of one or more of its strings for the purpose of changing their tone or pitch, of a chart transversely slidable with respect to and under the strings of said instrument, said chart having means for indicating the chords of the major and the minor keys, substantially as described.

808,803. **HORSE-BLANKET.** PETER ANDERSEN, Seattle, Wash., assignor to Ole Hanson, Seattle, Wash. Filed Feb. 15, 1905. Serial No. 245,703.

Claim.—1. A covering for live stock formed with an opening, a cover extending over said opening and being spaced therefrom, and guards arranged at opposite sides of said cover and extending above the same to prevent the reins from catching under said cover.



2. A covering for live stock formed with a ventilator-opening, opposite legs secured to said covering, cross-bars secured to said legs and being arranged below the upper ends thereof, and a cover supported on said cross-bars and extending over the opening in said covering.

3. A blanket formed with a ventilator-opening, a cover extending over said opening and having its opposite end portions secured to the blanket, and a frame for supporting the cover, having guards projecting above the edges of said cover.

4. A blanket provided with a ventilator-opening, a cover, and an open frame for supporting said cover over said ventilator-opening, said frame comprising arched wires having their ends secured to the blanket on opposite sides of said ventilator-opening, and stay-wires secured to said arched wires and having their ends secured to the blanket.

5. A blanket provided with a ventilator-opening, arched wires extending over said ventilator-opening and having their ends secured to the blanket, wires secured and extending at an angle to said first wires and having their end portions inclined downwardly and secured to the blanket, and a cover supported by said wires and having its ends resting on the end portions of the last-named wires.

6. A blanket provided with a ventilator-opening, a cover therefor, and means for supporting said cover over the opening, said means comprising spaced-apart arched wires formed with leg portions secured to the blanket and having their upper portions bent inwardly and downwardly and merging in cross-bars on which said cover rests.

7. A blanket provided with a ventilator-opening, a plurality of spaced-apart arched wires formed with leg portions having their upper portions bent inwardly and downwardly and continuing in cross-bars, and a cover supported on said bars and having its ends secured to the blanket.

8. A blanket provided with a ventilator-opening, a cover therefor, and a frame for supporting said cover comprising lateral arched wires secured to the blanket and being formed with seats in which said cover is engaged, and longitudinal wires secured to the lateral wires and having their end portions inclined downwardly and secured to the blanket, said cover extending down over the inclined portions of the longitudinal wires and being secured to the blanket.

808,804. **GLASS-FURNACE.** WILLIAM M. ANDERSON, Pittsburg, Pa. Filed Aug. 9, 1905. Serial No. 273,369.

Claim.—1. In a glass-furnace, the combination of an open melting-chamber and an inclosed melting-chamber separated from the open chamber and so situate as to be capable of absorbing heat from the open melting-chamber, substantially as specified.

2. In a glass-furnace, the combination of one or more open melting-chambers and one or more inclosed melting-chambers separated from the open melting-chambers and so situate as to be protected from the loss of heat by the outer open melting-chambers; substantially as specified.

808,805. **BRACELET.** JOSEPH RANDALL, North Attleboro, Mass. Filed May 13, 1905. Serial No. 260,946.

Claim.—1. In an article of the class described, a pair of curved sections, one of which is tubular, a hinge portion beveled on its inner side on the other of said sections and pivoted with its beveled end within said tubular section, a block in said tubular section having a rounded end, and a spring for holding said block with said rounded end in contact with said beveled end.

2. In an article of the class described, a pair of curved tubular sections, a hinge-block attached to one section and pivoted within the other section, said block being beveled inward on its end, a curved block within the other of said sections having a rounded end adjacent to and in the line of the end of said hinge, and a spring behind said block for pressing it against said hinge for closing and maintaining closed said hinged section.

3. In an article of the class described, a pair of curved sections, tubular throughout, a hinge-block attached to the end of one section and pivoted within the other section, the end of said block being beveled inwardly, a bent block in said other section having a curved end adjacent to and in the line of said hinged block, a stop in said last-named tubular section and a spring between said stop and block for pressing said block against said hinge to close and maintain closed said hinged section.

4. In an article of the class described, a pair of curved sections, one of said sections being tubular, a hinge-block attached to one section and pivoted within the other section, said block being beveled inward on its end, a curved block within the other of said sections having a rounded end adjacent to the end of said hinge-block, and a spring behind said curved block for pressing it against said hinge-block for closing and maintaining closed said hinged section.

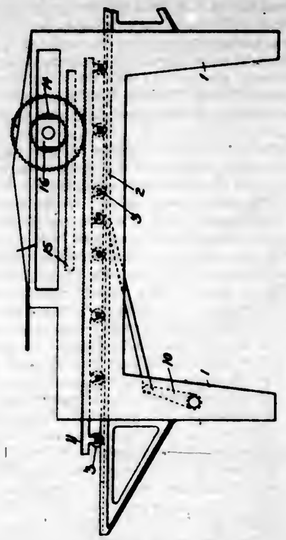
5. In an article of the class described, a pair of curved sections, one of said sections being tubular throughout, a hinge-block attached to the end of one section and pivoted within the other section, the end of said block being beveled inwardly, a bent block in said other section having a curved end adjacent to said hinge-block, a stop in said last-named tubular section and a spiral spring between said stop and curved block for pressing said curved block against said hinge-block to close and maintain closed said hinged section.

808,806. **BED-AND-CYLINDER MOTION FOR PRINTING-PRESSES.** MONTGOMERY J. RAMSEY, San Francisco, Cal., assignor, by mesne assignments, to Whitman Autopress Company, a Corporation of New York. Filed Apr. 3, 1904. Serial No. 201,267.

Claim.—1. In a printing-press, in combination, a frame, a bed reciprocating on said frame, the sides of said bed being unrestrained by said frame against upward movement thereon, a shaft, a crank thereon, and a Y-shaped connection between the crank and the bed, the arms of the Y being connected to the sides of the bed, whereby pressure at any point of the platen is received between the two supporting-points, substantially as described.

2. In a printing-press, in combination, a frame having on each side a guide, a cylinder and boxes therefor sliding under said guides, a stationary rack on each side of the frame, said racks being between the guides, a bed, a rack secured at each side thereof, a large and a small gear-wheel at each end of the cylinder, said gear-wheels and cylinder being all secured together, the large gear-wheels engaging the racks on the bed, and the small gear-wheels engaging the racks on the frame, and means for directly reciprocating the bed in continuous engagement with the cylinder, substantially as described.

3. In a printing-press, in combination, a frame having on each side a guide, a cylinder and boxes therefor sliding under said guides, a stationary rack on each side of the frame, a bed, a rack secured at each side thereof, a large and a small gear-wheel at each end of the cylinder, said gear-wheels and cylinder being all secured together, the large gear-wheels engaging the racks on the bed, and the small gear-wheels engaging the racks on the frame, and means for directly reciprocating the bed in continuous engagement with the cylinder, substantially as described.



808,807. **SHOE-SOLE FASTENER.** WILLIAM BECK, St. Paul, Minn., assignor of one-tenth to Frank Brahs, one-tenth to William Brahs, one-tenth to John McGrann, one-tenth to Charles Joyce, one-tenth to Fred Johnson, and one-tenth to Thomas Welch, Henderson, Minn. Filed May 11, 1905. Serial No. 259,951.

Claim.—1. A device of the class described comprising a substantially U-shaped body portion having one end thereof inclined or beveled to form a cutting edge and its opposite end provided with a plurality of depending attaching-spurs.

2. A device of the class described comprising a substantially U-shaped body portion having its inner walls at one end thereof inclined or beveled to form a cutting edge, said body portion being provided with a plurality of attaching-spurs.

808,808. **BROODER.** CHARLES J. BROOKS, Los Angeles, Cal. Filed Jan. 3, 1905. Serial No. 239,853.

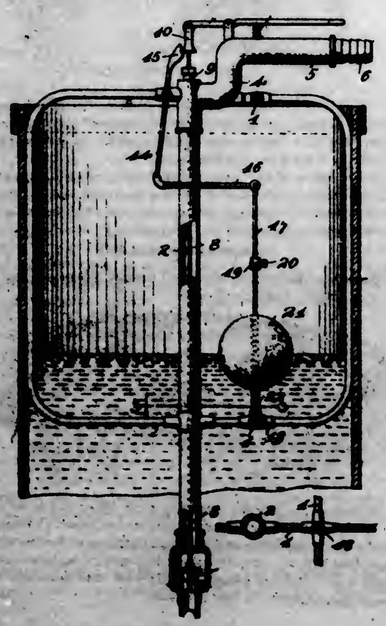
Claim.—1. A brooder consisting of an upper and lower chamber formed into a series of compartments by means of adjustable flexible slitted partitions, said partitions forming unobstructed communication with the other chambers; heat-generating means located in said lower chamber communicating with heat-radiating means in said upper chamber to heat the same.

2. A brooder consisting of an upper and lower chamber, adjustable flexible slitted partitions in said upper chamber dividing it into a series of compartments consisting of a central compartment and end compartments, said end compartments having hinged roofs and provided with air-outlets and communicating means, said central compartment having in its front and rear walls hinged adjustable doors and containing the heat-distributing means, said lower chamber having heat-generating means, consisting of a spring-adjusted lamp having a metal chimney extending upwardly into said central compartment and provided with heat-distributing outlets, said outlets communicating by means of metal tubes with heat-radiating tubes having outlet-vents terminating outside the central chamber.

3. A brooder consisting of an upper and lower chamber, adjustable flexible slitted partitions in said upper chamber dividing the same into a series of compartments consisting of a central compartment and end compartments, said end compartments having hinged roofs and provided with air-outlets and communicating means; said central compartment having in its front and rear walls hinged adjustable doors and containing the heat-distributing means; a spring-supported lamp in the lower chamber; a metal chimney having heat-distributing outlets at the top thereof seated on said lamp and extending upwardly into said upper compartment and closed at its upper end; a closed cylindrical fresh-air drum open at its lower end and closed at its upper end and having near the upper end a series of heat-outlets; said fresh-air drum forming means to supply heated fresh air for the central and end compartments; metal tubes extending through the fresh-air drum and communicating with the chimney, heat-radiating tubes having outlet-vents terminating outside the central chamber, said radiating tubes being in communication with the tubes leading from the chimney.

4. In a brooder heat-generating means, said means consisting of a spring-supported lamp exposed to cool-air currents, in combination with a metal chimney closed at its upper end having heat-outlet openings located near the top of said metal chimney; a cylindrical fresh-air drum surrounding said chimney closed at its upper end, said fresh-air drum having a series of heat-outlets at its upper end, metal tubes communicating with said chimney and extending through the air-drum; radiating tubes having outlet-vents terminating outside the roof of the central compartment, said radiating tubes communicating with the tubes leading from the chimney.

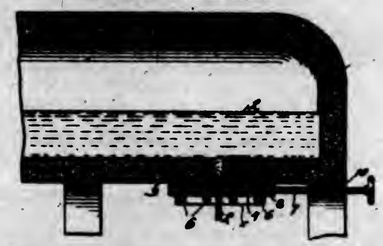
808,809. **ICE-CAN FILLER.** GEORGE S. BOWLING, Clarksville, Tenn. Filed June 19, 1905. Serial No. 265,919.



Claim.—1. A device of the character described comprising a frame adapted to fit within the end of an ice-can, a filling-tube supported in said frame, a valve arranged in the lower end of the tube to close the same, a stem connected to said valve and projecting upwardly through an elbow on the upper end of the tube, a head arranged on the upper end of said valve-stem, a spring to close said valve, a pivotally-mounted latch-bar adapted to engage the head on said valve-stem and hold said valve open, a trip-rod slidably mounted in said frame and connected to said latch-bar, a float arranged on said rod, means whereby said float will engage and lift said rod when raised by the water in the tank, thereby tripping said latch-bar, and releasing said valve, substantially as described.

2. A device of the character described comprising a frame, adapted to fit within the end of an ice-can, a filling-tube supported in said frame, a valve arranged in the lower end of the tube to close the same, a stem connected to said valve and projecting upwardly through an elbow on the upper end of the tube, a head arranged on the upper end of said valve-stem, a lever pivotally mounted on the right-angularly-formed offset end of said tube, said lever being pivotally connected at one end to the head on said valve-stem, a spring arranged under the opposite end of said lever to force said valve-stem downwardly and normally hold the valve closed, a latch-bar pivotally mounted on said frame to engage the head on said valve-rod and thereby to hold said valve open, a right-angularly-projecting arm arranged on the lower end of said latch-bar, sockets arranged in said frame, a trip-rod slidably mounted in said sockets and pivotally connected with the arm on said latch-bar, a collar adjustably mounted on said rod, a float slidably mounted on said rod and adapted to be raised into engagement with the collar on said rod by the rising of the water in said can, thereby lifting said rod and releasing the valve, substantially as described.

808,810. **GLASS-FURNACE.** HENRY M. BROOKFIELD, New York, N. Y. Filed Mar. 3, 1902. Serial No. 96,268.

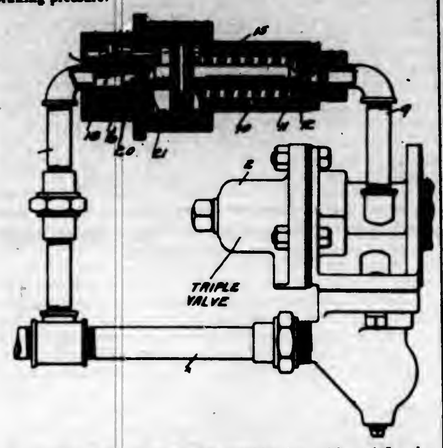


Claim.—1. A furnace for molten glass provided with a discharge-orifice passing directly through the bottom of the furnace, a valve for said orifice consisting of a plate provided with an opening and provided with solid parts on both sides of the opening adapted to close the orifice, rollers located below the valve-plate upon which the latter is adapted to move, and means for moving the valve-plate, whereby molten glass may be discharged directly from the interior of the furnace and whereby the valve is made durable.

2. A furnace for molten glass provided with a discharge-orifice passing directly through the bottom of the furnace, a valve for said orifice consisting of a plate provided with an opening and provided with solid parts on both sides of the opening adapted to close the orifice, rollers located below the valve-plate upon which the latter is adapted to move, and means for moving the valve-plate, consisting of a screw-threaded rod secured to the valve-plate so as to be free to rotate and provided with a hand-wheel and a support for said rod through which the same passes interiorly screw-threaded, whereby molten glass may be discharged directly from the interior of the furnace in accurately-graduated amounts, and the valve for controlling the same will be made durable.

808,811. **AUTOMATIC PRESSURE-RETAINER.** JAMES W. BROWN, Minneapolis, Minn. Filed Aug. 27, 1904. Serial No. 222,266.

Claim.—1. A pressure-retainer comprising a casing connected with the exhaust of a triple valve and with the train service-pipe, and having a valve operating to close said exhaust when the pressure in the train-pipe is raised above a certain predetermined point preparatory to reducing the train-pipe pressure to set the brakes, and to remain in such position and allow successive reductions of train-pipe pressure without opening the exhaust, until the pressure in the train-pipe is reduced to a certain predetermined point below normal braking pressure.



2. In an air-brake system, the combination, with a triple valve and the train service-pipe, of a casing connected with the exhaust of said valve and with the train-pipe, a spring-actuated valve provided in said casing and normally closing the passage to said train-pipe and opening the passage to the exhaust, a cylinder having its piston connected with said valve and a second valve operating at a higher pressure than said first-named valve, and normally closing a passage leading from said train-pipe to said cylinder.

3. The combination, with a train service-pipe, and a triple valve, of a retainer-casing connected with the exhaust of said valve and with said pipe, and provided with a cylinder and piston arranged in said cylinder and having valves on its opposite sides arranged to close respectively the passages to the exhaust and to said train-pipe, a spring arranged to normally hold the train-pipe valve in its closed position and open the passage to the exhaust, until the pressure on said piston exceeds a predetermined number of pounds, said casing being provided with a passage leading from said train-pipe to said cylinder around said train-pipe valve, and a valve provided in said passage and having a spring that normally holds said passage-valve in its closed position, but is adapted to yield and open the passage to said cylinder when the pressure in the train-pipe exceeds a predetermined number of pounds, substantially as described.

4. The combination, with a triple valve and the train service-pipe, of means operating to close the exhaust of said valve when the pressure in the train-pipe is raised above a certain predetermined point preparatory to reducing the train-pipe pressure to set the brakes and allow successive reductions of train-pipe pressure without opening the exhaust until the pressure in the train-pipe is reduced to a certain predetermined point below normal braking pressure.

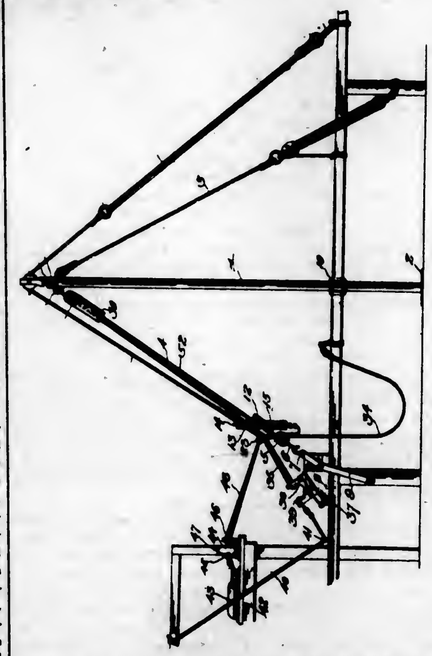
808,812. **STAMP.** TAYLOR S. BUCK, New York, N. Y. Filed Feb. 21, 1905. Serial No. 246,787.

Claim.—1. In a stamp, a main head, a toothed wheel and a transverse shaft for rotating said wheel, a printing-surface mounted on said head and formed with a recess coincident with said wheel, and a printing-disk secured to said wheel and working in said recess, substantially as described.

2. A stamp comprised of a main head having a wheel mounted in a recess formed in the head, a transverse shaft for rotating said wheel, a recessed cushion mounted on said head and having a circular printing-surface bearing figures denoting the days of the month, a printing-disk mounted on said wheel and formed with one or more recesses to receive removable type-blocks and bearing an index-pointer the face of the index-pointer and the type-blocks being on a level with the permanent printing matter, substantially as described.

3. In a stamp the main head formed with a main recess and with a transverse recess joining said main recess in combination with a toothed wheel held to rotate in said main recess and a worm-shaft held in said transverse recess to engage with the said toothed wheel, a printing-surface mounted on said head and formed with a recess coincident with said wheel and a printing-disk secured to said wheel and working in the last-mentioned recess substantially as described.

808,813. **PORTABLE STARTING-GATE FOR RACE-COURSES.** MARK CASSIDY, Washington, D. C. Filed Feb. 6, 1905. Renewed Dec 4, 1905. Serial No. 290,908.

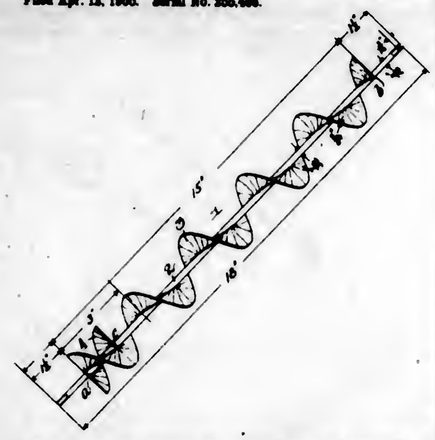


Claim.—1. In a mechanically-operated gate of the character described, the combination with suitably-braced portable, supporting-standards, of inclined guide-rods connected thereto, gate-carrying blocks slidably mounted on said rods, swiveled pulleys arranged in the upper ends of said standards, a rope passing over said pulleys and secured at one end to said blocks, an elastic connection secured to the opposite end of said rope, gate-holding mechanisms to hold said gate down against the tension of said elastic connection, a gong having a spring-actuated clapper, a clapper-holding mechanism to hold said clapper in position to strike said gong, a flexible connection between said gate-carrying blocks and said clapper-holding mechanism whereby when the gate is released said clapper will be simultaneously released and caused to strike said gong, and a releasing-cord connected to said gate-holding mechanism, substantially as described.

2. In a mechanically-operated gate of the character described, the combination with suitably-braced, portable, supporting-standards, of inclined guide-rods connected thereto, gate-carrying blocks slidably mounted on said rods, swiveled pulleys arranged in the upper ends of said standards, a rope passing over said pulleys and secured at one end to said blocks, elastic-rubber tubing secured to the opposite end of said rope and connected to a fixed support, gate holding and releasing mechanisms arranged on each side of the track, the mechanism on one side comprising a pivoted releasing-dog to which said adjacent gate-carrying block is connected, and a pivoted spring-projected latch to hold said dog in operative position, a releasing-cord secured to said dog-holding latch, the holding and releasing mechanism on the opposite side of the track comprising a pivotally-

mounted hook-plate, with which is adapted to be connected the gate-carrying block on this end of the gate, a cord to hold said hook-plate in operative position, said cord passing through pulleys to the gate-carrying block on the opposite end of the gate whereby when the latter is released the slackening of said cord will release said hook-plate and disengage the gate-carrying block at this end of the gate, substantially as described.

808,814. PROPELLER-WHEEL. FRANK CHINNAR, Ely, Minn. Filed Apr. 13, 1905. Serial No. 255,466.



Claim.—The herein-described screw-propeller comprising a shaft, the long blade forming a continuous spiral blade of low pitch, having its convolutions extending from end to end of the shaft, and a short blade opposite to and starting at a point abreast of the front end of the first convolution of the long blade, making one-half a convolution around the shaft and terminating with the first half-convolution of the long blade.

808,815. LOCK FOR SASHES. CHARLES B. COHANT, Adrian, Mich., assignor of one-half to Oliver M. Whitmore, Adrian, Mich. Filed July 15, 1905. Serial No. 269,846.

Claim.—1. A lock comprising a casing consisting of semicylindrical members one of which is provided with laterally-extending anchoring-flanges, diaphragms extending transversely of the casing and serving to lock said members together, and a bolt eccentrically mounted for sliding movement in said diaphragms.

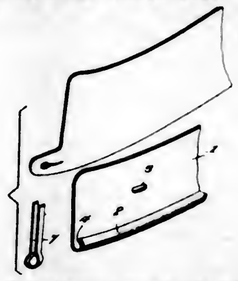
2. A lock-casing comprising semicylindrical members one of which is provided with a plurality of openings, spaced diaphragms secured to the opposite member and provided with lugs adapted to engage the openings in the adjacent member, one of said members being provided with lateral flanges along its longitudinal edges forming diametrically-disposed longitudinal beads externally of the casing.

3. A lock comprising a sectional casing secured together by spaced diaphragms provided with eccentric registering openings, a bolt slidably mounted in the eccentric openings and having a rigid disk, and a key arranged to exert pressure between one of the diaphragms and the disk to move the bolt.

4. A lock comprising semicylindrical casing members secured together by spaced diaphragms provided with registering eccentric openings, diametrically-disposed longitudinal beads formed externally of the casing, a bolt slidably mounted in the eccentric openings and having a rigid collar and disk, a spring arranged to hold the bolt normally at the outward extreme and the collar in contact with one of the diaphragms, and a key arranged to exert a pressure between one of the diaphragms and disk to move the bolt.

5. A lock comprising semicylindrical casing members one of which has outturned flanges along its longitudinal edges and provided with a keyhole and spaced openings, diaphragms provided with eccentric openings and rigidly secured to one casing member and having lugs engaged within the spaced openings of the other member, a bolt slidably mounted in the eccentric openings and having a rigid disk at one end and an axial spur at the other with a rigid collar disposed intermediate the ends, a spring surrounding the bolt and bearing against the collar and one of the diaphragms and arranged to hold the bolt normally at its outward extreme with the collar in contact with one of the diaphragms and a key having a bit proportioned to pass through the keyhole and exert a pressure between one of the diaphragms and the disk and to move and retain the bolt at its inward extreme and with the spur within the lines of the casing.

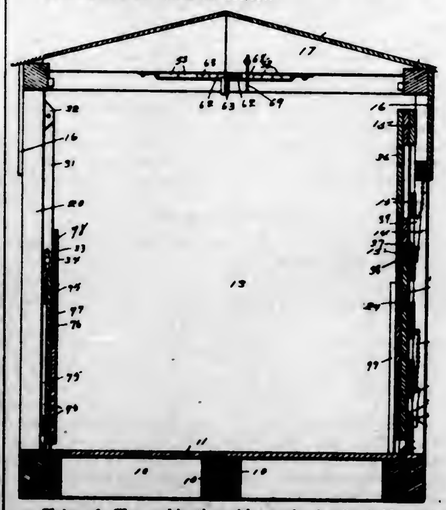
808,816. COLLAR-PROTECTOR. JAMES F. CONNELL, Beaine, Kans. Filed May 11, 1905. Serial No. 260,965.



Claim.—1. In combination a lining for collars having a suitable opening therein, and a spring-clip for attaching the lining to the collar, the inner member of the clip being adapted to pass through the before-mentioned opening in the lining.

2. The combination of a lining for collars having a suitable opening therein and having an edge rolled back upon itself and inward to clasp an edge of the collar, and a spring-clip for attaching the lining to the collar, the inner member of the clip being adapted to pass through the before-mentioned opening in the lining.

808,817. RAILWAY-CAR. JOHN C. COTTRELL, Kingsley, Iowa. Filed June 1, 1904. Serial No. 210,687.



Claim.—1. The combination with a car having fixed sides and a doorway in each car side, of two hinged car sides on the inner surfaces of each side of the car extending from the doorway to the adjacent end of the car and capable of swinging from position parallel with the fixed car sides upwardly and inwardly to a horizontal position, and partition-pieces for filling the space between the hinged car sides when in their horizontal position.

2. The combination with a car having fixed sides, of two car side pieces hinged to the inner faces of the car sides to swing from position parallel with the car sides upwardly and inwardly to form a horizontal partition, a strip to enter between the adjacent edges of the hinged car sides when in their horizontal positions, and a strip on top of said strip to overlap the tops of the adjacent edges of the hinged sides.

3. The combination with a car having fixed sides, of two car side pieces hinged to the inner faces of the car sides to swing from position parallel with the car sides upwardly and inwardly to form a horizontal partition, a strip to enter between the adjacent edges of the hinged car sides when in their horizontal positions, a strip on top of said strip to overlap the tops of the adjacent edges of the hinged sides, and means for securing said strips in position between the adjacent edges of the hinged car sides.

4. The combination with a car having fixed car sides, of two hinged car sides capable of swinging from position parallel with the fixed car sides upwardly and inwardly to form a horizontal partition, a strip to enter between the adjacent edges of the hinged car sides when in their horizontal position, and hooks secured to the under surface of the said strip to engage the under surface of the adjacent portions of the hinged car sides to prevent the strip from moving upwardly.

5. the combination with a car having fixed sides, of two hinged car sides capable of swinging from a position parallel with the fixed car sides upwardly and inwardly to form a horizontal partition, a strip to enter between the adjacent edges of the hinged car sides when in their horizontal position, hooks secured to the under surface of said strip to engage the under surface of the adjacent portions of the hinged car sides to prevent the strip from moving upwardly, said car provided with roof-beams, blocks secured to one of the roof-beams spaced apart to receive said strip and supporting devices adjacent to the blocks to engage and hold said strip.

6. The combination of a car, of blocks spaced apart and secured to the top of the car, a strip designed to enter between the blocks and supports adjacent to the blocks designed to engage and hold the strip in position.

7. The combination with a car having fixed slatted sides, of a solid car side piece hinged to the inner portion of the car to swing from a position parallel with one of the fixed slatted car sides upwardly and inwardly, and a strip secured to the outer face of the hinged car side near its lower end to enter between the lower slats of the fixed slatted car side.

8. The combination with a car having a fixed slatted side, the upper edge of the lower slat thereof beveled outwardly and downwardly, of a solid car side portion hinged to the inner face of the slatted car side to move from position adjacent to the slatted car side upwardly and inwardly, and a strip secured to the outer surface of the hinged car side near its lower edge, said strip having its lower edge beveled downwardly and outwardly to fit the top of the lower slat and to direct water thrown against the solid car side downwardly and outwardly over the lower slat.

9. The combination with a car having a fixed slatted side, the upper edge of the lower slat thereof beveled outwardly and downwardly, of a solid car side portion hinged to the inner face of the slatted car side to move from position adjacent to the slatted car side upwardly and inwardly, a strip secured to the outer surface of the hinged car side near its lower edge, said strip having its lower edge beveled downwardly and outwardly to fit the top of the lower slat and to direct water thrown against the solid car side downwardly and outwardly over the lower slat, and a metal strip on top of the beveled strip with one edge inserted in the hinged car side, said metal strip extended downwardly and outwardly over the beveled strip.

10. The combination with a car having a slatted car side, of a hinged solid car side arranged to swing from position adjacent to the car side upwardly and inwardly, a slotted eye fixed to the hinged solid car side to project through the slatted car side, and a wedge-shaped pin to engage the outer surface of the slatted car side and to pass through said eye.

11. The combination with a car having a slatted side, of a solid side hinged to the slatted side to swing from a position adjacent to the slatted side upwardly and inwardly, a strip on the outer surface of the solid side to project between the slats of the slatted side, a slotted eye fixed to said strip to project between the slats and a wedge-shaped pin to engage the outer surface of the slatted side and to pass through said eye.

12. The combination with a car having a slatted side and a doorway in the slatted side, of a solid side hinged to the slatted side to swing from position adjacent to the slatted side upwardly and inwardly and a weather-strip secured to the outer surface of the hinged solid side to engage the adjacent portion of the doorway.

13. The combination with a car having uprights at its sides and horizontal slats secured to the inner surfaces of the uprights, the central horizontal slats notched at the uprights, of a central horizontal partition for the car, and beams to enter the notches in the slats with their ends in engagement with the inner faces of said uprights to support the horizontal partition.

14. The combination with a car having uprights at its sides and horizontal slats secured to the inner surfaces of the uprights, the central horizontal slats notched at the uprights, of a central horizontal partition for the car, and beams to enter the notches in the slats with their ends in engagement with the inner faces of said uprights to support the horizontal partition, said car also provided with notched roof-beams to receive the horizontal partition-beams, and means for securing them in position in said notched roof-beams.

15. The combination with a car having uprights at its sides and horizontal slats secured to the inner surfaces of the uprights, the central horizontal slats notched at the uprights, of a central horizontal partition for the car, beams to enter the notches in the slats with their ends in engagement with the inner faces of said uprights to support the horizontal partition, said car also provided with notched roof-beams to receive the horizontal partition-beams, and pivoted plates overlapping said notches in the roof-beams.

16. The combination with a car having notched roof-beams and a block on one end of the car, of a number of horizontal partition-beams having notches in their ends, said horizontal partition-beams designed to enter the notches in the roof-beams and to receive said block in the notches in their ends and means for securing the horizontal partition-beams in the notches of the roof-beams.

17. The combination with a car having notched roof-beams and a block on one end of the car, of a number of horizontal partition-beams having notches in their ends, said horizontal partition-beams designed to enter the notches in the roof-beams and to receive said block in the notches in their ends, and pivoted plates secured to the roof-beams to pass under the horizontal partition-beams in the said notches, and a lock for said plates.

18. The combination with a car having fixed slatted car sides, of two hangers pivoted near the top inner surfaces of the slatted car side to move upwardly and inwardly, a solid car side pivotally and slidingly supported on said hangers, said solid car side formed with a strip at the lower portion of its outer face to enter between the lower slats of the fixed car side, the under surface of said strip inclined downwardly and outwardly.

19. The combination with a car having fixed car sides, of a solid upper side piece spaced apart from the roof of the car, a pair of hangers pivoted to the fixed car side, a solid lower car side pivotally and slidingly supported by said hangers and movable from position parallel with the fixed car side to a horizontal position supported at its outer end by the hangers and also movable to a substantially horizontal position with one edge supported on top of the upper side piece.

20. The combination with a car having fixed car sides, of a solid upper side piece spaced apart from the roof of the car, a pair of hangers pivoted to the fixed car side, a solid lower car side pivotally and slidingly supported by said hangers and movable from position parallel with the fixed car side to a horizontal position supported at its outer end by the hangers and also movable to a substantially horizontal position with one edge supported on top of the upper side piece, and hooks supported adjacent to the car-roof to engage the inner end of the lower side piece when in position adjacent to the roof.

21. The combination with a car having fixed car sides, of a solid upper side piece spaced apart from the roof of the car, a pair of hangers pivoted to the fixed car side, a solid lower car side pivotally and slidingly supported by said hangers and movable from position parallel with the fixed car side to a horizontal position supported at its outer end by the hangers and also movable to a substantially horizontal position with one edge supported on top of the upper side piece, hooks supported adjacent to the car-roof to engage the inner end of the lower side piece when in position adjacent to the roof.

22. The combination with a car having fixed car sides and doorways in the car sides, of a horizontal partition inside of the car extending from points near the doorway to the adjacent ends of the car, and door-pieces shaped to rest against the inside of the doorway in one position and to fill the space between the horizontal partitions in another position.

23. The combination with a car having fixed car sides and doorways in the car sides, of a horizontal partition inside of the car extending from a point near the doorways to the adjacent ends of the

car, and a door-piece formed of two layers, one layer having its ends projected beyond the other and the other layer having its top projected above the first, the layer with its ends projected beyond the other designed to overlap the adjacent portions of the horizontal partition in one position and the layer having its top projecting above the other designed to rest against the inner surface of the doorway in its other position.

34. The combination with a car having fixed car sides and doorways in the car sides, of a horizontal partition inside of the car extending from points near the doorway to the adjacent ends of the car, door-pieces shaped to rest against the inside of the doorway in one position and to fill the space between the horizontal partitions in another position, and hooks secured to the top of the car to support said door-pieces in a horizontal position near the roof of the car.

35. The combination with a car having a fixed side, of an upper side piece hinged to the inner face of the fixed car side near its top to swing from position parallel with the fixed side upwardly and inwardly, and a folding hay-rack on the inner face of said upper car side.

36. The combination with a car having a slatted side, of an upper solid car side hinged to the slatted side at its upper inner portion and designed to swing from a position adjacent to the slatted car side upwardly and inwardly, and means for detachably securing the solid side to the slatted side.

37. The combination with a car having a slatted side, of an upper solid car side hinged to the slatted side at its upper inner portion and designed to swing from a position adjacent to the slatted car side upwardly and inwardly, means for detachably securing the solid side to the slatted side, and means for detachably securing the solid side piece to the roof of the car.

38. The combination with a car having a fixed side, of an upper car side hinged to the upper inner portion of the fixed car side, a pair of hangers hinged to the upper inner portion of the fixed car side at the ends of the upper car side, and a lower car side pivotally supported on said hangers.

39. The combination with a car having a fixed slatted car side, of an upper solid car side pivotally and slidingly connected with the inner upper portion of the slatted car side, and a strip secured to the outer lower portion of the hinged upper car side to project between two of the slats of the slatted car side, the lower edge of said strip inclined downwardly and outwardly.

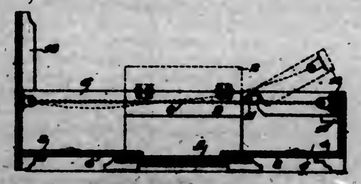
40. The combination with a car having a fixed slatted car side, of an upper solid car side pivotally and slidingly connected with the inner upper portion of the slatted car side, a strip secured to the outer lower portion of the hinged upper car side to project between two of the slats of the slatted car side, the lower edge of said strip inclined downwardly and outwardly, a slotted eye on said strip to project between the slats of the car side, and a wedge-shaped pin to engage the outer portions of the slats and enter the slotted eye.

41. The combination with a car having a fixed slatted side, of a solid upper car side pivotally, slidingly and detachably connected with the upper inner portion of the slatted car side.

42. The combination with a car having a fixed car side, of an upper hinged car side having its lower inner edge projected below the lower outer edge, and a lower pivoted car side having its outer top edge projected above its inner top edge to fit the lower edge portion of the upper side.

43. The combination with a car having a fixed car side, of an upper hinged car side having its lower inner edge projected below the lower outer edge, and a lower pivoted car side having its outer top edge project above its inner top edge to fit the lower edge portion of the upper side, and means for securing both of said hinged side pieces to the adjacent fixed side.

808,818. COMBINED TABLE AND FOLDING BED. CHARLES P. DEVERS, Oakland, Cal. Filed Sept. 14, 1905. Serial No. 278,268.



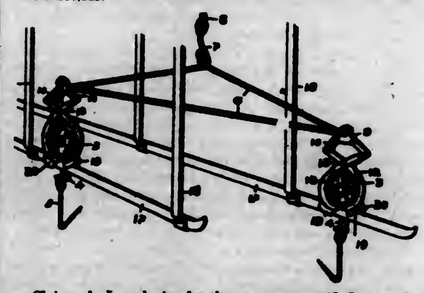
Claim.—1. The combination of a central base-section having a bottom and vertical end portions, box-sections hinged to the central section and foldable relative thereto to form a table or to form a bed, and one of said box-sections carrying the table-top which also forms the headboard, the other of said sections having a footboard folding beneath the table-top when the parts are arranged in the form of a table, hinged members carried by the base to lock the box-sections when opened out into bed form, and an elastic mattress carried by the sections, said box-sections having hinged back portions operating inside of the end portions of the base and cooperating with the bottom of said base to inclose a containing-chamber.

2. The combination of a central base-section having a bottom and vertical end portions, box-sections hinged to the central section and foldable relative thereto to form a table or to form a bed, said box-sections having hinged back portions operable between the end portions of the base and cooperating with the bottom of said base to inclose a containing-chamber and one of said box-sections carrying the table-top which also forms the headboard, the other of said sections having a footboard folding beneath the table-top when the parts are arranged in the form of a table, hinged members carried by the base to lock the box-sections when opened out into bed form, an elastic mattress carried by the sections, and means operated independently of the opening movements of the box-sections to stretch the mattress.

3. The combination of a central base-section, box-sections hinged thereto cooperating therewith to form a table or a bed, hinged members carried by the base to prevent the box-sections from closing up when extended as a bed, said hinged box-sections provided with hinged back portions operable between the ends of the base and cooperating therewith and with the bottom of said base to inclose a containing-chamber, an elastic mattress secured at one end to one of said box-sections, the other end of the mattress to a frame pivoted to the other box-section, said frame arranged to describe an arc to stretch the mattress to carry the plane of the latter below the pivots of said frame, and stop means to limit the downward movement of said frame.

4. The combination of a central base-section having a bottom portion and vertical end portions, said end portions provided with foldable sections, box-sections hinged to said central section and cooperating therewith to form a bed or table, said box-sections arranged to have their ends pass inside of the end portions of the base when folded up into a table, said foldable sections of said base end forming stops to prevent said box-sections closing up when opened out into the form of a bed, a mattress carried by the sections, and said box-sections having hinged back portions cooperating with the bottom of the base-section to inclose a containing box or chamber.

808,819. TRACKING DEVICE FOR SLAUGHTER-HOUSE TRAVELERS. CHARLES R. DE MOSS, Indianapolis, Ind., assignor of one-half to Miles P. Barker, Franklin, Ind. Filed Apr. 26, 1905. Serial No. 257,513.



Claim.—1. In a device for the purposes specified, a track, removable travelers mounted thereon, a tree, plates pivotally secured to the ends of the tree lazy-tongs supported by the plates and adapted to temporarily hold said travelers, means for raising and lowering the tree, and means on said lazy-tongs for directing the travelers into operative position upon their respective tracks.

2. In a device for the purposes specified, a tree, plates pivotally secured to the ends of the tree, tongs secured by links to said plates the lower ends of said tongs being curved inwardly toward each other, and provided with outwardly-diverging flanges in pairs for each jaw of the tongs, means for raising and lowering the tree, a track or tracks, and travelers having wheels to roll upon said tracks said wheels fitting the bent jaws of the tongs and adapted to be removably held by the latter.

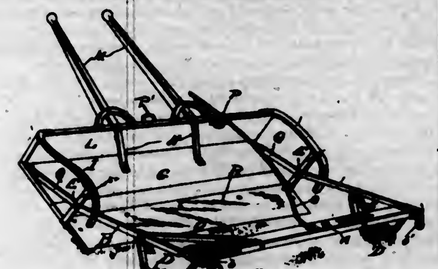
3. In a device for the purposes specified, a track or tracks, travelers adapted to be placed thereon having grooved wheels to roll upon said tracks, a vertically-movable tree, lazy-tongs supported by the ends of said tree, the jaws of said tongs being adapted to open to receive and closed to hold the grooved wheels of the travelers, said lazy-tongs having diverging flanges in pairs, for the purpose of locating the grooved wheels upon said track, said tongs opening when pressed downwardly against said track, and means for automatically locking them in their open position.

4. In a device for the purposes specified, a tree, and lazy-tongs carried by said tree one of the jaws of said lazy-tongs having a hook to hook into a portion of the other jaw when the two are opened, to hold the tongs in open adjustment.

5. Means for placing travelers on tracks, comprising a tree, tongs suspended from the ends of the tree said tongs having pairs of diverging flanges as guides in placing the device on the track, means for opening and closing the tongs, and a lock for automatically locking the tongs in open position.

6. In a device for the purposes specified, tracks, removable travelers operating upon said tracks said travelers including a peripherally-grooved wheel, a tree, means for raising and lowering the tree, plates through which the ends of the tree are passed to secure the plates to the tree, tongs, links connecting the tongs with the plates, one jaw of said tongs being slotted for the passage of the other jaw therethrough the lower jaws of said tongs being curved to fit the grooved peripheries of the traveler-wheels the lower ends of said tongs having oppositely-divergent flanges for guides in placing the wheels of the travelers on their tracks, and a lock for holding the jaws of the tongues in their open position.

808,820. ROAD-GRADER. FERDINAND B. DREVER, Grenada, Miss. Filed June 15, 1905. Serial No. 265,346.



Claim.—1. In a road-grader, a suitable frame, runners for supporting the frame at the front, a scraper pivotally connected to the rear end of the frame, runners attached to the scraper and adapted to support the scraper when said scraper is inverted.

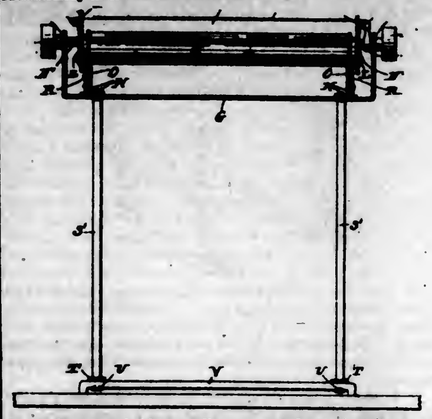
2. In a road-grader, a suitable frame, runners on the forward end of the frame, a scraper, cross-arms pivotally attached to the rear of the frame, a scraper secured to the lower ends of the arms, links attached to the scraper and pivotally connected to the pivots of the cross-arms, runners attached to the scraper, and to the opposite ends of the cross-arms, and suitable handles for manipulating the scraper.

3. In a road-grader, a suitable frame, runners on the forward end of the frame, cross-arms pivotally attached to the rear of the frame, a scraper attached to the ends of the cross-arms, runners attached to the scraper and extending over the opposite ends of the cross-arms, the ends of the runners being curved, whereby the said runners support the scraper in its inverted position.

4. In a road-grader, a suitable frame, runners on the forward end of the frame, cross-arms pivotally attached to the rear of the frame, a scraper attached to ends of the cross-arms, runners attached to the scraper and extending over the opposite ends of the cross-arms, the ends of the runners being curved, whereby the said runners support the scraper in its inverted position, an arm attached to forward end of the frame, and a hook slidable on the arm, and means whereby the hook supports the scraper.

808,821. COPY-HOLDER. JOHN S. DUDLEY, Marion, Ohio. Filed May 8, 1905. Serial No. 259,504.

Claim.—1. In a copy-holder, a roller, a paper-clamp pivotally secured thereto and having its ends extending outside the ends of the roller, and springs secured to the extended ends of the clamp and the ends of the roller to normally hold said clamp in a clamping position, substantially as shown and described.



2. In a copy-holder, a roller, a paper-clamp pivotally secured thereto and having its ends extending outside the ends of the roller, springs secured to the extended ends of the clamp and the ends of the roller to normally hold said clamp in a clamping position, and a spring-actuated roller bearing against the first-mentioned roller, substantially as shown and described.

3. In a copy-holder, a roller having a longitudinal groove therein, a spring-actuated shaft in said groove having its ends extending beyond the ends of the roller, springs secured to the extended ends of the clamp and the ends of the roller to normally hold said clamp in a clamping position, and a plate secured to said shaft, substantially as shown and described.

4. In a copy-holder, a roller having a longitudinal groove, a crease adjacent to said groove and a depression connecting said groove and crease, a spring-actuated shaft mounted in said groove having its ends extending beyond the ends of the roller, springs secured to the extended ends of the clamp and the ends of the roller to normally hold said clamp in a clamping position, and a plate secured to said shaft and adapted to lie in said depression and having a turned edge to seat in said crease, substantially as shown and described.

5. In a copy-holder, a roller having a longitudinal groove, a crease adjacent to said groove and a depression connecting said groove and crease, a spring-actuated shaft mounted in said groove having its ends extending beyond the ends of the roller, springs secured to the extended ends of the clamp and the ends of the roller to normally hold said clamp in a clamping position, a plate secured to said shaft and adapted to lie in said depression and having a turned edge to seat in said crease, and a spring-actuated roller bearing against the first-mentioned roller, substantially as shown and described.

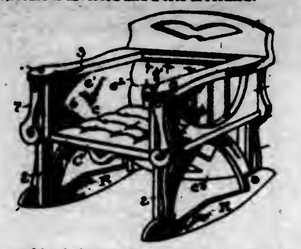
6. In a copy-holder, an angular frame having slots in its ends, a roller journaled in said slots having a longitudinal groove, a crease adjacent to said groove and a depression connecting said groove and crease, a spring-actuated shaft mounted in said groove having its ends extending beyond the ends of the roller, springs secured to the extended ends of the clamp and the ends of the roller to normally hold said clamp in a clamping position, a plate secured to said shaft and adapted to lie in said depression and having a turned edge to seat in said crease, rods secured to said frame, levers pivoted on said rods, a roller journaled in the free ends of said levers, and springs connecting said levers and hooks on said frame, substantially as shown and described.

808,832. CONVERTIBLE FURNITURE. CHARLES W. DUNN, Cleveland, Ohio. Filed Apr. 4, 1905. Serial No. 253,702.

Claim.—1. In a combined chair and crib, a main frame and a pivotally-supported seat therein adapted to be inverted in front of said main frame and locked therewith, and rocking supports rigid with said main frame and said seat-frame, respectively, constructed to carry the structure when reversed to form a crib.

2. A main frame, a seat-frame pivoted in the front of the main

frame and invertibly supported in the front of the main frame and provided with a rocker at its edge, and the main frame provided with a rocker forming the upper portion of its back corresponding to the rocker on the seat-frame, whereby rocker-supports are provided when the structure is inverted and a crib is formed.



3. In a combined chair and crib, a main frame and a seat-frame having side and end walls and pivoted in the main frame, means to lock said seat-frame rigidly with the main frame in an inverted position, and a bottom-section for the crib suspended upon the main frame and adapted to be moved into horizontal position on a plane with the said seat when the parts are inverted.

4. In a combined chair and crib, the main frame and a pivotally-supported seat-frame therein constructed to form a portion of the crib, and a section of crib-bottom suspended upon the main frame behind the said seat and adapted to be brought into a horizontal position, and rests on the main frame for said section.

5. The combination of the main frame and the seat-frame pivoted therein at its front, a pivotally-supported member at the rear of said seat-frame constructed to rest the seat thereon, and means to temporarily lock the said seat and member together.

6. The combination of the main frame and the seat-frame having a back rigid therewith, a support for the said seat-frame pivoted on the main frame behind said back, and the said seat-frame provided with a depending portion locked with said support, whereby the seat-frame is carried at the rear when used for a chair.

7. The combination of the main frame and the seat-frame pivoted at its front within the sides of the main frame and provided with a rigid back on its top and a rocker on its bottom, and a support for the rear of the seat-frame hinged at its top to the main frame, and said main frame having a rocker to correspond to the rocker on the seat-frame when the parts are inverted.

8. In a combined chair and crib, a main frame having chair arms and sides and an extension on its back having a rounded edge, a seat-frame having a back portion and sides between the sides of the main frame and pivoted to swing into inverted position at the front of the main frame and form one-half of the crib, means to lock said frames rigidly together in inverted position, and a bottom-section to fill out the other half of the crib-bottom hinged at one edge to the back of the main frame.

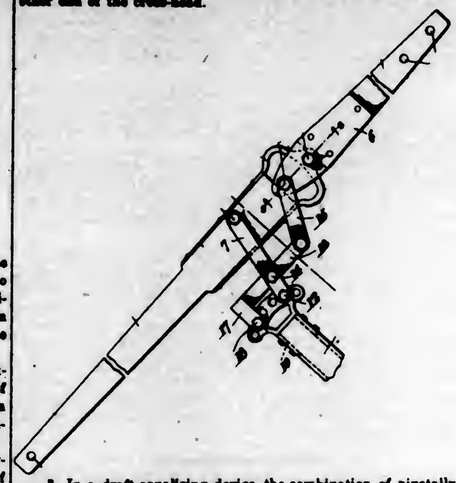
9. In a combined chair and crib, the invertible main frame and the separately-invertible seat-frame pivoted therein, and means locking said frames together, a rocker on each frame and a bottom-section for the crib adapted to fill the space between said seat-frame and the rear of the main frame, said bottom-section hinged at one edge and constructed to provide a support for the seat-frame when the structure is used as a chair.

10. In a combined chair and crib, an invertible main frame having a rocker on its top and rear, in combination with a seat-frame pivoted in the front of said main frame and provided with side and rear walls on its top and a rocker at its bottom and front, and a bottom-section for the crib separately supported on the main frame and having a shouldered portion to engage the seat when the parts are used as a chair.

808,823. DRAFT-EQUALIZER. HIRAM H. BOOK, Johnstown, Iowa. Filed Jan. 9, 1905. Serial No. 240,267.

Claim.—1. In a draft-equalizing device, the combination of a main evener-bar, a supplemental evener-bar fulcrumed thereon, a draft connection extending rearwardly from the main evener-bar independently of the supplemental evener-bar, a cross-head fulcrumed intermediate of its ends upon the draft connection, a connection between one end of the cross-head and the supplemental evener-bar, and a draft connection at the other end of the cross-head.

2. In a draft-equalizing device, the combination of a main evener-bar, a supplemental evener-bar fulcrumed intermediate of its ends upon the inner end portion of the main evener-bar, a draft connection extending rearwardly from the main evener-bar, a cross-head fulcrumed intermediate of its ends upon the draft connection, a connection between one end of the cross-head and the inner end of the supplemental evener-bar, and a draft connection carried by the other end of the cross-head.



3. In a draft-equalizing device, the combination of pivotally-connected main and supplemental evener-bars, a draft connection extending rearwardly from and carried solely by the main bar, and another draft connection extending rearwardly from and carried solely by the supplemental bar and having a portion crossing and pivotally connected to the draft connection of the main bar.

4. In a draft-equalizing device, the combination of a main evener-bar having a transverse slot adjacent its inner end, a supplemental evener-bar having its inner end bifurcated and straddling the slotted portion of the main evener-bar, said supplemental bar being fulcrumed upon the inner extremity of the main bar, a draft connection extending rearwardly from the inner end portion of the main bar, a cross-head fulcrumed intermediate of its ends upon the draft connection, links extending between one end of the cross-head and the inner end of the supplemental bar, a pivot-pin connecting the links and the inner end of the supplemental bar and working in the slot of the main bar, and a draft connection at the opposite end of the cross-head.

5. In a draft-equalizing device, the combination of a main evener-bar having a substantially U-shaped loop embracing the inner end of the bar, a supplemental bar having its inner end bifurcated and straddling the loop to which it is pivotally connected at the inner end of the bifurcation, a draft connection extending rearwardly from the inner end portion of the main bar, a cross-head fulcrumed intermediate of its ends upon the draft connection, links connected to one end of the cross-head and embracing the bifurcated inner end of the supplemental bar, a pivot-pin piercing the links and the supplemental bar and working in the loop of the main bar, and a draft connection carried by the other end of the cross-head.

808,824. BOTTLE-HOLDING RACK. OTTO ECK, Baltimore, Md. Filed Aug. 10, 1905. Serial No. 273,611.

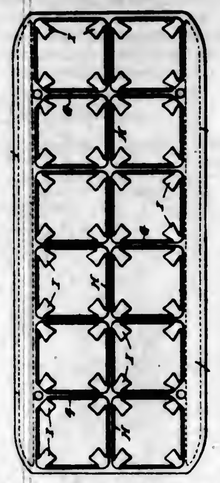
Claim.—1. A bottle-holding rack, comprising a member provided with openings to receive the bottle-necks, and a second member spaced therefrom, said second member being provided with a series of openings, and fingers extending inwardly into the openings.

2. A bottle-holding rack having a plate provided with a series of openings therein, with fingers extending inwardly into said openings and capable of being flexed.

3. A bottle-holding rack provided with a plate having a series of rectangular openings therein, a series of fingers extending diagonally into said openings and capable of being flexed.

4. A bottle-holding rack having a member provided with a series of substantially rectangular openings, with a finger extending inwardly from each corner of each of said openings toward the center thereof.

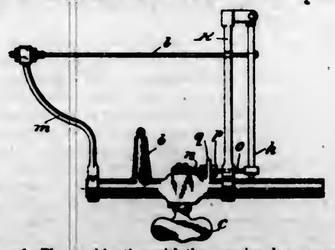
5. A bottle-holding rack having a member provided with a series of openings substantially rectangular in shape, with a finger extending inwardly from each corner of each of said openings, the outer ends or faces of the fingers being curved



6. A bottle-holding rack having a member provided with a series of substantially rectangular openings, a finger extending inwardly from each corner of each of said openings, the outer end of each finger being curved, while the neck thereof is reduced, substantially as described.

7. In a bottle-holding rack, the combination of a member provided with a series of circular openings adapted and designed to receive the bottle-necks, a second member spaced from the first member and secured thereto, said second member being provided with a series of substantially rectangular openings the centers of which are coincident with the centers of the circular openings in the first-named member, and a finger extending inwardly from each corner of each of said rectangular openings toward the center thereof.

808,825. SAFETY GAS-BURNER. SIGURD W. EKROOS, New York, N. Y. Filed Dec. 1, 1904. Serial No. 234,895.



Claim.—1. The combination with the gas-pipe, burner and gas-cock, of the valve located in the gas-pipe and at one side of the burner, means to open said valve and temporarily hold it open through the instrumentality of the gas-cock when the latter is opened, an exterior thermostat subject to the gas-flame and connected with the valve for maintaining the open condition of said valve while the flame continues, and means for automatically closing said valve when the flame is extinguished.

2. The combination with the gas-pipe, burner, and gas-cock, of the valve located in the gas-pipe and at one side of the burner, means to open said valve and temporarily hold it open through the instrumentality of the gas-cock when the latter is opened, an exterior thermostat subject to the gas-flame and connected with the valve for maintaining the open condition of said valve while the flame continues, and a spring for automatically closing said valve when the flame is extinguished.

3. The combination with the gas-pipe, burner, and the gas-cock, of the valve located in the gas-pipe and at one side of the burner, an exterior thermostat subject to the gas-flame for maintaining the open condition of said valve while the flame continues, means to open said valve and temporarily hold it open through the instrumentality of the gas-cock when the latter is opened, and means for automatically closing said valve when the flame is extinguished, the said means for opening said valve and temporarily holding it open comprising the cam on the gas-cock, thrust-rod, and the valve-opening lever which is connected with the thermostat.

4. The combination with the gas-pipe, burner and the gas-cock, of the valve located in the gas-pipe and at one side of the burner, an exterior thermostat subject to the gas-flame for maintaining the open condition of said valve while the flame continues, means to open said valve and temporarily hold it open through the instrumentality of the gas-cock when the latter is opened, and means for automatically closing said valve when the flame is extinguished, the said means for opening said valve and temporarily holding it open comprising the cam on the gas-cock, thrust-rod, and the valve-opening lever which is connected with the thermostat, and the spring for releasing the cam from the thrust-rod.

808,826. PIPE-CLEANER. FRED A. FALT, West Medford, Mass. Filed Apr. 7, 1905. Serial No. 254,304.

Claim.—1. A pipe-cleaner comprising in its construction two wires joined together at one end thereof, the free ends of said wires beveled outwardly away from each other to form chisel-points.

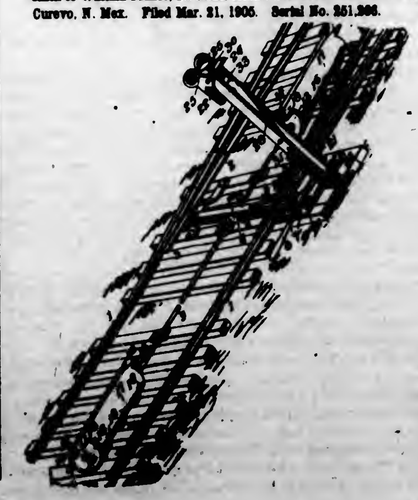
2. A pipe-cleaner comprising in its construction two wires joined together at one end thereof, the free ends of said wires beveled in opposite directions to form cutting edges, each of said wires provided with a corrugation upon its outer face for the purpose specified.

3. A pipe-cleaner consisting of a wire bent midway of its length, the two halves thereof brought into juxtaposition and connected together for a portion of their length, the free ends of said wire beveled outwardly away from each other to form chisel-points.

4. A pipe-cleaner consisting of a wire bent midway of its length, the two halves thereof brought into juxtaposition and connected together for a portion of their length, thence diverging one from the other, each provided upon its outer edge with a tooth for the purpose specified.

5. A pipe-cleaner consisting of a wire having a flattened side and bent midway of its length to bring the flattened sides of the two halves thereof into juxtaposition, said halves connected together for a portion of their length and beveled outwardly away from each other to form chisel-points.

808,827. AUTOMATIC RAILROAD-SWITCH. JAMES M. FAULK, St. John, Kans., assignor, by direct and mesne assignments, of one-sixth to William Frame, St. John, Kans., and one-sixth to D. J. Smith, Cuervo, N. Mex. Filed Mar. 21, 1905. Serial No. 251,366.



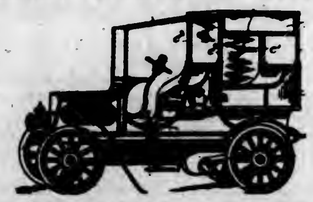
Claim.—1. In a railway-switch, the combination of an automatically-operated switch-bar, a manually-operated switch-bar, means for actuating the manually-operated switch-bar independent of the automatically-operated switch-bar, and means for locking the manually-operated switch-bar-actuating means to the automatically-operated switch-bar for movement therewith.

2. In a railway-switch, the combination of an operating-shaft, a switch-bar operably connected therewith, cylinders mounted upon the operating-shaft, housings for the cylinders embodying movable sections normally closed together, and means for limiting the separating movement of the sections aforesaid.

3. In a railway-switch, the combination of an automatically-operated switch-bar, a hand-operated switch-bar, an operating-lever for the hand-operated switch-bar, and means for interlocking the said lever and the automatically-operated switch-bar.

4. In a railway-switch, the combination of an automatically-operated switch-bar, a hand-operated switch-bar, an operating-lever for the hand-operated switch-bar, and a member projected from the automatically-operated switch-bar and adapted to interlock with the lever aforesaid.

808,828. **COVER FOR VEHICLES.** WILLIAM FINDLAY, Edinburgh, Scotland. Filed Dec. 6, 1904. Serial No. 235,085.



Claim.—In a device of the character described, the combination of a plurality of stationary tubular pillars, tubes telescoping in said pillars and adapted to be raised and lowered therein, a casing connecting a pair of said tubes and permanently secured thereto, a pair of supplementary casings hinged to opposite ends of said first-named casing and adapted to be swung out from said casing, spring-actuated rollers in each of said casings, and covers wound on said rollers and adapted to be unwound therefrom.

808,829. **HORSESHOE-PAD.** ADOLPH FISCHER, Milwaukee, Wis. Filed Sept. 26, 1903. Serial No. 174,855.

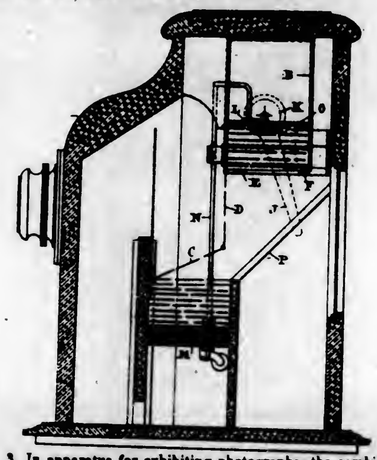
Claim.—1. A horseshoe-pad comprising a block of felt having an outer margin conforming in shape and size substantially to a metallic horseshoe, and provided with a thick central portion adapted to fit the open central portion of the metallic horseshoe and projecting through the same; said pad being also provided with a connecting porous tissue of hard cement permeating all portions of the felt.

2. The combination with a metallic horseshoe, of a block of felt covering said shoe and having a thick central portion projecting through the central portion of the shoe, and a connecting porous tissue of hard cement permeating the felt.

808,830. **APPARATUS FOR PERMITTING THE SUCCESSIVE EXHIBITION OF PHOTOGRAPHS.** CHARLES FOURNIAT, Lyon, France. Filed Nov. 10, 1904. Serial No. 232,139.

Claim.—1. In apparatus for exhibiting photographs, the combination with a series of articulated alternate photographs and rigid plates, of a cage for holding said series, means for supporting the series therein and for releasing the plates one by one, a receiver placed with its rear wall substantially alined with the front wall of the cage so that the dropped plate holds the photograph next above in one and the same vertical plane, substantially as described.

2. In apparatus for exhibiting photographs, the combination with a series of articulated alternate photographs and rigid plates, of a cage for holding said series, means for supporting the series therein and for releasing the plates one by one, a receiver placed with its rear wall substantially alined with the front wall of the cage so that the dropped plate holds the photograph next above in one and the same plane said receiver comprising a table for supporting the dropped photographs and plates in a folded condition when shown, and means for causing said table to descend according to the fall of plates from the cage, substantially as described.



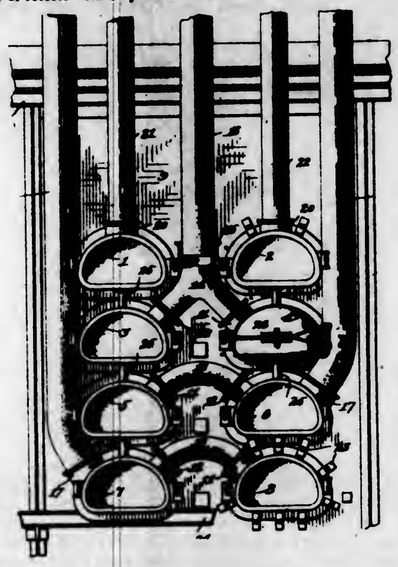
3. In apparatus for exhibiting photographs, the combination with a series of articulated alternate photographs and rigid plates, of a cage adapted to contain said series, means in conjunction with said cage for supporting said plates and photographs and releasing the plates one by one to permit the photographs to drop, a receiver for the dropped plates and photographs with its rear wall substantially alined with the front wall of the cage so that the last dropped plate in the receiver holds the photograph next above it in a predetermined focal plane, a vertically-movable table forming the floor of said receiver and a support for said table comprising a rod deriving its support from the series in the cage for the purpose set forth.

808,831. **STAND-PIPE AND CONNECTION FOR GAS-RETORTS.** SAMUEL J. FOWLER, Cambridge, Mass. Filed Aug. 31, 1905. Serial No. 276,530.

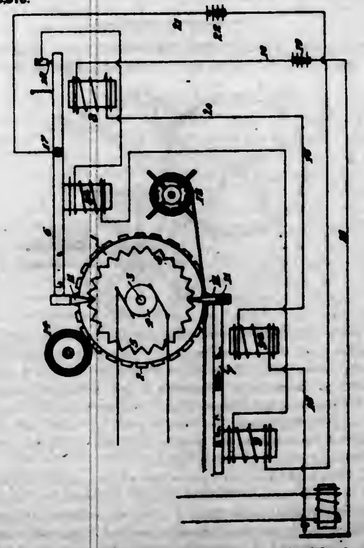
Claim.—1. A bench of retorts for the manufacture of coal-gas, comprising a lower, an upper, an upper and a lower intermediate horizontal group of retorts, means for connecting the lower group of retorts, a stand-pipe to one side of the bench of retorts and communicating with an outer retort of the lower group, means for connecting the retorts of the lower intermediate group, a stand-pipe at the other side of the bench and communicating with the outer retort of the intermediate group on the same side as the said stand-pipe, means for connecting the retorts of the upper intermediate group, a stand-pipe interposed between the stand-pipes on the outer sides of the bench and communicating with the upper intermediate group, a stand-pipe interposed between the stand-pipes communicating with the upper and lower intermediate groups and connected with a portion of the retorts in the upper group and means interposed between the stand-pipes communicating with the lower, and the upper intermediate groups for conveying the gas from the remaining portion of retorts in the upper group.

2. An apparatus for the manufacture of coal-gas comprising a bench of retorts arranged in four separate and superposed groups, each group having a plurality of retorts in horizontal alinement, means for connecting the interior of the retorts on the same horizontal line with each other in each of the three lower groups, thereby forming three independently-connected and superposed groups of retorts in three horizontal planes, means for separately connecting each of the three independently-connected groups with a hydraulic main, means for connecting a portion of the retorts in the upper horizontal group with a hydraulic main and a separate means for connecting the remaining portion of the retorts in the upper group with a main.

3. An apparatus for the manufacture of coal-gas comprising a bench of retorts arranged in separate and superposed groups and each group having a plurality of retorts in horizontal alinement and directly over or under the adjacent retort in the next group, a mouthpiece attached to each of said retorts, a vertical strut interposed between the top and bottom of each of the adjacent mouthpieces, means for connecting the interiors of the mouthpieces on the same horizontal line with each other and forming independent groups of retorts in the same plane, and means for independently connecting each group of retorts with a hydraulic main.

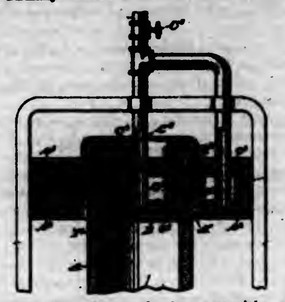


808,832. **RECEIVER AND RECORDER FOR WIRELESS AND OTHER TRANSMISSIONS.** FRED B. GALLAGHER, San Francisco, Cal., assignor of one-third to Simeon L. Phillips and one-third to Walter D. Valentine, San Francisco, Cal. Filed June 15, 1905. Serial No. 265,378.



Claim.—In a receiver and recorder, a type-wheel having constantly-operative impelling means, a pivoted armature carrying means for locking the type-wheel, another pivoted armature carrying a striking hammer, a pair of magnets for each armature arranged respectively at opposite sides of its pivot, a controller-circuit which includes one magnet of each armature, and a striker-circuit which includes the other magnet of each armature, all substantially as and for the purposes set forth.

808,833. **BOTTLE-SEALING MECHANISM.** EWALD GOLDSTEIN, Cologne, Germany. Filed Feb. 26, 1902. Serial No. 95,669.



Claim.—A bottle-sealing mechanism, comprising an inner and outer member spaced from each other to receive a bottle-neck between them, each of said members having two spaced heads or plates forming spaces open entirely only on the side near the bottle-neck, the outer member also having a backing extending from the outer edge of one head to the outer edge of the other head, and expansible bodies located in said spaces, and adapted to expand toward each other, and therefore toward the bottle-neck.

808,834. **RELAY.** CHARLES L. GOODSELL, Rochester, N. Y. Filed Nov. 11, 1905. Serial No. 286,905.

Claim.—1. In a relay, the combination with a core, of a coil thereon, an armature, front and rear pole-pieces, one of which forms a support for the relay, the other forming a support for the armature, contact-springs, and means removably securing the core to the supporting pole-piece.

2. In a relay, the combination with a core, of a coil thereon, an armature, front and rear pole-pieces, one of which forms a support for the relay, the other forming a support for the armature, contact-springs mounted on said supporting pole-piece, and means removably securing said core to the supporting pole-piece.

3. In a relay, the combination with a core, of a coil thereon, a rear pole-piece, a front pole-piece, and means operated from the front for securing both of the pole-pieces to the core.

4. In a relay, the combination with a core, of a coil thereon, a rear pole-piece adapted to support the relay, a front pole-piece, and means operable from the front securing both of the pole-pieces to the core.

5. In a relay, the combination with a core, of a coil thereon, a rear pole-piece adapted to support the relay, contact-springs, a front pole-piece, an armature mounted thereon, and means passing through the core adapted to secure the pole-pieces to said core.

6. In a relay, the combination with a core, of a coil thereon, a rear pole-piece adapted to support the relay, contact-springs mounted on said pole-piece, a front pole-piece, an armature mounted thereon, and a screw passing through the core adapted to secure the pole-pieces to the core.

7. A relay having a rear pole-piece adapted to form a support for said relay, and means operable from the front for removably securing the relay to said pole-piece.

8. A relay having a hollow core, a rear pole-piece to form a support for said relay, and means passing through the core to secure the relay to the pole-piece.

9. A relay having a hollow core, a rear pole-piece adapted to form a support for said relay, a front pole-piece, and a screw passing

through said core and having threaded engagement with said rear pole-piece to hold it removably secured to said core, the head of said screw holding said front pole-piece in place.

10. In a relay, the combination with a core, of a coil thereon, a rear pole-piece secured to the core and extending along the top of the coil, a front pole-piece secured to the other end of the core and extending rearwardly a distance toward the rear pole-piece to leave an air-gap between the pieces, means for removably securing the core to said pole-pieces, a plate pivoted over the end of the front pole-piece, the rear part of said plate forming an armature and overlapping the end of the rear pole-piece, and switch-springs secured to the rear pole-piece and extending forwardly over said plate and having engagement with the front part of said plate, current-flow through said coil causing attraction of the armature part of the plate to cause actuation of said springs.

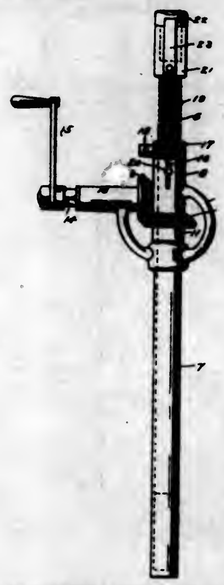
11. In a relay, the combination with a core, of a coil thereon, a rear pole-piece secured to the core and extending along the top of the coil, a front pole-piece secured to the other end of the core and extending rearwardly a distance toward the rear pole-piece to leave an air-gap between the pieces, means for removably securing the core to said pole-pieces, a plate pivoted over the end of the front pole-piece, the rear part of said plate forming an armature and overlapping the end of the rear pole-piece, and switch-springs secured to the rear pole-piece and extending forwardly over said plate and having engagement with the front part of said plate, current-flow through said coil causing attraction of the armature part of the plate to cause actuation of said springs, said switch-springs serving to hold said plate on its pivot.

12. In a relay, the combination with a core, of a coil thereon, a rear L-shaped pole-piece secured to the rear end of the core and extending forwardly a distance along the top of the coil, an L-shaped front pole-piece secured to the front end of the core and extending rearwardly a distance to leave a non-magnetic gap between the pole-pieces, means passing through the core for securing the pole-pieces to the core, a pivot edge at the end of the front pole-piece, a plate of magnetic material pivoted on said edge along an intermediary line, the part of said plate to the rear of said pivot forming an armature, the part of said plate in front of said pivot forming an actuating-lever, and circuit-changing springs mounted at their rear ends on the rear pole-piece and being connected at their front ends with the actuating-lever, said springs normally causing pressure against said lever to hold the armature part away from the rear pole-piece, current-flow through said coil causing attraction of the armature part, whereby said circuit-changing springs are actuated.

13. In a relay, the combination with a hollow core, of a coil thereon, a rear L-shaped pole-piece secured to the rear end of the core and extending forwardly a distance along the top of the coil, a front L-shaped pole-piece secured to the front end of the core and extending rearwardly a distance along the top of the coil to leave a non-magnetic gap between the ends of the pole-pieces, means passing through said core connecting said pole-pieces and removably securing them to the core, the end of the front pole-piece offering a pivot edge, a magnetic plate pivoted on said edge at an intermediary line, the rear part of said plate forming an armature, the front part of said plate forming an actuating-lever, and switching mechanism mounted on the rear pole-piece and having connection with the actuating-lever, said switching mechanism serving normally to depress said actuating-lever to retain the armature out of contact with the rear pole-piece, current-flow through said coil causing said armature to be attracted to complete the magnetic circuit through the pole-pieces and causing switching mechanism to be actuated, said switching mechanism serving also to retain said plate in position on said pivot edge.

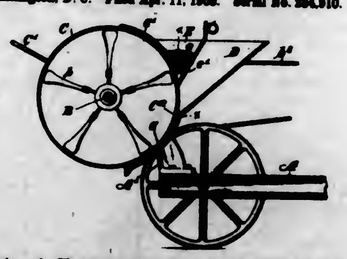
14. In a relay, the combination with a hollow core, of a coil thereon, an L-shaped rear pole-piece secured to the rear end of the core and extending forwardly a distance along the top of the coil, a front L-shaped pole-piece secured to the front end of the core and extending rearwardly a distance along the top of the coil, a screw passing through said core adapted to removably hold said pole-pieces on said core, a non-magnetic gap between the ends of the pole-pieces, the end of the front pole-piece being shaped to form a pivot edge, a plate of magnetic material pivoted at an intermediary line on said edge, the rear part of said plate forming an armature and the front part thereof forming an actuating-lever, and actuating and contact switch-springs mounted at their rear ends on the rear pole-piece and extending forwardly therefrom, the front end of the actuating-springs having connection with said actuating-lever and tending normally to depress said lever to retain the armature away from the rear pole-piece and out of engagement with the contact-springs, current-flow through said coil causing energization of the relay, whereby the armature is attracted toward the rear pole-piece, said actuating-lever being raised to carry the actuating-springs into engagement with the contact-springs.

808,835. RIVET-HOLDER. ROBERT J. GORDON, Detroit, Mich. Filed Dec. 24, 1904. Serial No. 238,389.



Claim.—An extensible bucking-bar for riveting, comprising a telescoping tube and screw, the latter having means at the head to hold a rivet, a nut which may be turned, on the screw and against the tube, and a split sleeve carried on the tube and extending around the screw, having a clamp connecting the split portions of the sleeve to hold the screw at adjustment.

808,836. METHOD OF MIXING CONCRETE. PETER C. HAINS, Washington, D. C. Filed Apr. 11, 1903. Serial No. 254,910.



Claim.—1. The improved method of mixing concrete which consists in wetting the inert material and then subjecting the wet inert material to the action of a cloud of dry powder cement to cause the particles of inert material to become covered with cement paste.

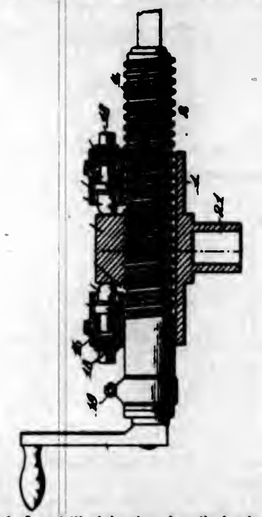
2. The improved method of mixing concrete which consists in wetting the inert material and moving the wet inert material in a cloud of dry powder cement to cause the particles of inert material to become covered with cement paste.

3. The method of mixing concrete which consists in forming a cloud of powder cement, wetting the inert material, and moving the wet inert material in the cloud of dry powder cement to cause the particles of inert material to become covered with cement paste.

4. The method of mixing concrete which consists in forming a cloud of dry powder cement, and agitating a mass of wet inert material in said cloud of dry powder cement to cause the particles of wet inert material to become covered with cement paste.

5. The method of mixing concrete which consists in wetting the inert material, moving the wet inert material and simultaneously forcing a cloud of dry powder cement across the path of movement of the wet inert material to cause the particles of inert material to become covered with cement paste.

808,837. ROCK AND COAL DRILL. LESTER C. HAMMOND, Ottumwa, Iowa. Filed May 17, 1905. Serial No. 260,706.



Claim.—1. In a drill of the class described, a housing, a longitudinally-movable block, a hammer mounted in said housing and movable with and adjustable with respect to said block, and means for cushioning the movement of said block in either direction.

2. In a drill of the class described, a housing, a hammer mounted therein, a block mounted to move longitudinally of the drill and having a screw-threaded engagement with said hammer, and buffers for receiving opposite end impacts of said block.

3. In a drill of the class described, a housing, a hammer mounted therein and provided with exterior screw-threads, a slidably-mounted block having screw-threaded engagement with said hammer, means for cushioning said block and means for turning said hammer.

4. In a drill of the class described, in combination with a housing, a hammer mounted therein, a hinged block slidably mounted on the housing having screw-threaded engagement with said hammer, and means for turning said hammer.

5. In a drill of the class described, a housing, a hammer mounted therein and provided with exterior screw-threads, a slidably-mounted block having screw-threaded engagement with said hammer, resilient buffers located at opposite ends of said block, and means for turning said hammer.

6. In a drill of the class described, a housing, a hammer mounted therein and provided with exterior screw-threads, a slidably-mounted block having screw-threaded engagement with said hammer, spring-controlled plungers located at opposite ends of said block for cushioning the movements of the same, and means for turning said hammer.

7. In a drill of the class described, a housing, a hammer mounted therein and provided with exterior screw-threads, a slidably-mounted hinged block having screw-threaded engagement with said hammer, spring-pressed plungers located at opposite ends of said block for cushioning the movements of the same, means for adjusting the tension of the springs of said plungers, and means for turning said hammer.

808,838. METAL FILING. JAMES J. HANSEN, Jersey City, N. J., assignor, by mesne assignments, to Emma Hansen, Jersey City, N. J. Filed Dec. 22, 1904. Serial No. 238,372.

Claim.—1. In piling, beam members provided with flanges on opposite sides of one face thereof, planks adapted to engage the channels formed by said flanges, one of the flanges on one beam member adapted to slide between a flange on another beam member and its plank, a plate at the outer edge of each of said planks extending over the back of the adjoining beam member, and said plate secured to said plank by bolts passing through its beam member.

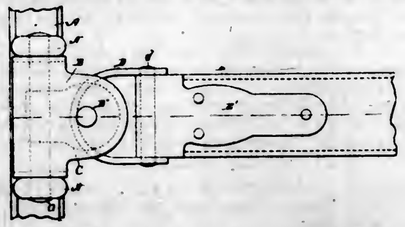
2. In piling, beam members provided with flanges on opposite sides of one face thereof, planks adapted to engage the channels formed by said flanges, one of the flanges on one beam member adapted to slide between a flange on another beam member and its plank, a plate at the outer edge of each of said planks extending over the back of the adjoining beam member, a plate on the opposite side of the piling extending over the adjoining plank, and said plate secured by bolts passing through said planks and said beam members.

808,839. PROCESS OF TREATING ORES. JUSTUS H. HAYNES and WILBUR D. RIDDLE, Denver, Colo., assignors to The Dolores Refining Company, Denver, Colo. Filed Mar. 20, 1905. Serial No. 251,000.

Claim.—1. The herein-described process of treating ores containing uranium, consisting in boiling the crushed ore with a solution of alkaline carbonate until the uranium contained in the ore is brought into solution.

2. The herein-described process of separating uranium and vanadium from ore, consisting in first crushing the ore to be treated; second, boiling the ore with a solution of alkaline carbonate until the metal to be extracted is placed in solution; third, drawing off the solution containing the dissolved metals; and finally precipitating the said metals, the uranium being precipitated by the addition of sodium hydroxid as sodium uranate, while the vanadium is precipitated as calcium vanadate by the addition of water-slaked lime.

808,840. HAME AND TRACE CONNECTOR. FREDERICK F. HOMANS, Battlecreek, Mich. Filed May 5, 1905. Serial No. 259,013.



Claim.—1. The combination of a plate having outwardly-projecting perforated ears adapted to be secured to a hame; a swinging plate formed of sheet metal, having inwardly-projecting perforated ears adapted to be embraced by the said hame-plate ears; a pivot-pin arranged through the perforated ears of said plates for securing them together; an inwardly-projecting pin carried by said swinging plate; a loop formed of sheet metal arranged to engage the pivot-pin of said plates, the arms of which are perforated to receive said pin carried by said swinging plate; a curved clevis-like strap formed of sheet metal, having a slot therein to receive the inner arm of said loop; and a pivot-pin carried by said curved strap for connecting the same to a trace, for the purpose specified.

2. The combination of a plate having outwardly-projecting perforated ears adapted to be secured to a hame; a swinging plate formed of sheet metal, having inwardly-projecting perforated ears; a pivot-pin arranged through the perforated ears of said plates for securing them together; an inwardly-projecting pin carried by said swinging plate; a loop formed of sheet metal arranged to engage the pivot-pin of said plates, the arms of which are perforated to receive said pin carried by said swinging plate; a curved clevis-like strap formed of sheet metal; and a pivot-pin carried by said curved strap for connecting the same to a trace, for the purpose specified.

3. The combination of a plate having outwardly-projecting perforated ears adapted to be secured to a hame; a swinging plate formed of sheet metal, having inwardly-projecting perforated ears; a pivot-pin arranged through the perforated ears of said plates for securing them together; an inwardly-projecting pin carried by said swinging plate; a loop formed of sheet metal arranged to engage the pivot-pin of said plates, the arms of which are perforated to receive

said pin carried by said swinging plate; and means for pivotally connecting a trace to said pin carried by said swinging plate, for the purpose specified.

4. The combination of a plate having outwardly-projecting perforated ears adapted to be secured to a hame; a swinging plate having inwardly-projecting perforated ears adapted to be embraced by said hame-plate ears; a pivot-pin arranged through the perforated ears of said plates for securing them together; an inwardly-projecting pin carried by said swinging plate; a loop arranged to engage the pivot-pin of said plates, the arms of which are perforated to receive said pin carried by said swinging plate; a curved clevis-like strap, having a slot therein to receive the inner arm of said loop; and a pivot-pin carried by said curved strap for connecting the same to a trace, for the purpose specified.

5. The combination of a plate having outwardly-projecting perforated ears adapted to be secured to a hame; a swinging plate having inwardly-projecting perforated ears; a pivot-pin arranged through the perforated ears of said plates for securing them together; an inwardly-projecting pin carried by said swinging plate; a loop arranged to engage the pivot-pin of said plates, the arms of which are perforated to receive said pin carried by said swinging plate; a curved clevis-like strap; and a pivot-pin carried by said curved strap for connecting the same to a trace, for the purpose specified.

6. The combination of a plate having outwardly-projecting perforated ears adapted to be secured to a hame; a swinging plate having inwardly-projecting perforated ears; a pivot-pin arranged through the perforated ears of said plates for securing them together; an inwardly-projecting pin carried by said swinging plate; a loop arranged to engage the pivot-pin of said plates, the arms of which are perforated to receive said pin carried by said swinging plate; and means for pivotally connecting a trace to said pin carried by said swinging plate, for the purpose specified.

7. The combination of a swinging plate; a pivot-pin for connecting said plate to a hame; a transversely-projecting pin carried by said swinging plate; a loop arranged to engage the pivot-pin of said plates, the arms of which are perforated to receive said pin carried by said swinging plate; a curved clevis-like strap having a slot therein to receive the inner arm of said loop; and a pivot-pin carried by said clevis-like loop for connecting the same to a trace, for the purpose specified.

8. The combination of a swinging plate; a pivot-pin for connecting said plate to a hame; a transversely-projecting pin carried by said swinging plate; a loop arranged to engage the pivot-pin of said plates, the arms of which are perforated to receive said pin carried by said swinging plate; and means for pivotally connecting a trace to said pin carried by said swinging plate, for the purpose specified.

808,841. APPARATUS FOR THE MANUFACTURE OF TOOTH-PICKS. HENRY S. HOOVER, Detroit, Mich. Filed Jan. 27, 1905. Serial No. 242,965.

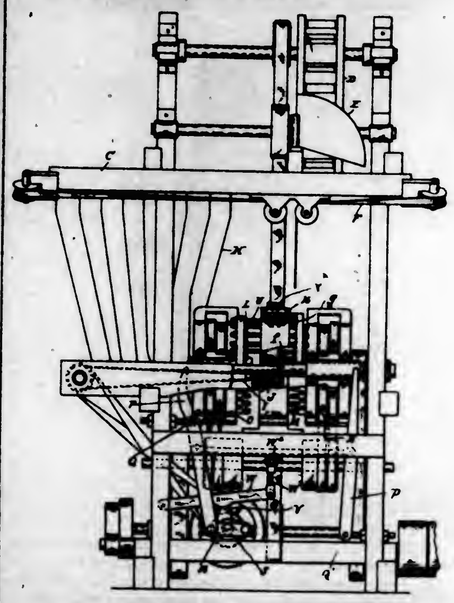
Claim.—1. A machine for forming toothpicks, comprising a holder for a tubular blank, a tapering reamer for engaging the end of said tube while secured by said holder, means for ejecting the reamed tube from said holder, and a cutter for severing the tube into splints during ejection from said holder.

2. A machine for forming toothpicks comprising means for assorting tubular blanks of varying diameters and arranging the different sizes in parallelism, a work-holder having sockets for the various sizes of tubes adapted to be alined therewith, and means for feeding the tubes into the sockets.

3. A machine for forming toothpicks, comprising means for assorting the tubular blanks of varying diameters, means for feeding the tubes of the various assorted sizes longitudinally and in parallelism, an intermittently-rotating work-holder, having a series of sockets for the respective sizes of tubes, adapted to be successively alined for engagement therewith, reamers for engaging said tubes while in said sockets to sharpen the ends thereof, means for ejecting said tubes from their sockets, and cutters for severing said tubes longitudinally into separate splints during ejection.

4. A machine for forming toothpicks comprising a work-holder provided with a socket for receiving the tubular blank, reamers arranged on opposite sides of said holder and rotating in opposite directions, and means for simultaneously inserting said opposite reamers into the ends of the tube to sharpen the ends thereof.

5. In a machine for forming toothpicks, the combination with a tubular blank-holder, having a series of open-sided, cylindrical socket-chambers, of means for feeding tubular blanks into engagement with said sockets, reamers for engaging opposite sides of said holder, which reamers are mounted to be registered at one point in the rotation of said holder, said reamers rotating in opposite directions, means for simultaneously inserting said opposite reamers into the ends of said tubes to sharpen the same, splitting-knives arranged to register with said tubes at another point in the movement of said holder, and ejectors simultaneously actuated with the actuation of said reamers to move the sharpened tubes longitudinally out from their sockets, and to simultaneously sever the same into separate splints by engagement with said cutters.



6. In a machine for forming toothpicks, the combination with a traveling holder for the tubular blanks, of means for ejecting said tube longitudinally from said holder, and a cutter comprising a circular series of radial blades, arranged in a position to aline with said tube at the point of ejection, whereby said tube will be severed into separate splints during the ejection.

7. A machine for forming toothpicks, comprising means for assorting the tubular blanks of varying diameters, means for feeding said blanks of the assorted sizes longitudinally and in parallelism, an intermittently-rotating work-holder having a series of sockets for the respective sizes of tubes, adapted to be successively alined for engagement therewith, reamers for engaging said tubes while in said sockets to sharpen the ends thereof, and means for ejecting said tubes from their sockets.

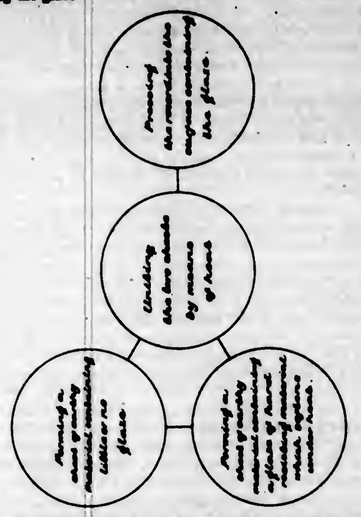
8. The combination of a trough, having discharge-openings of varying widths in one side thereof, and a traveling belt adjacent to the opposite side of said trough, adapted to feed cylindrical blanks of varying sizes longitudinally thereof, whereby said blanks are discharged through said openings from different points in the trough, according to their respective sizes.

9. The combination with a trough, having discharge-openings of varying widths in one side thereof, of means for feeding cylindrical blanks of varying sizes into said trough, and a traveling belt adjacent to the opposite side of said trough, upon which said blanks are deposited, whereby the movement of said belt will aline the blanks and carry the same longitudinally of the said trough, to discharge them through their respective discharge-openings.

10. The combination with a series of chutes, for the feeding of cylindrical blanks of varying sizes, of a traveling belt upon which said blanks are discharged through their respective tubes in parallel arrangement, and a stationary guide above said belts for separating the blanks from the different chutes.

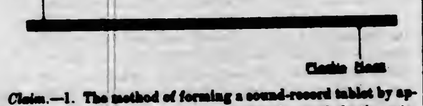
808,842. MANUFACTURE OF SOUND-RECORDS. WILLIAM H. HOTT and WILLIAM J. GAVIN, Bridgeport, Conn., assignors to The Bart Company, Hackensack, N. J., a Corporation of New Jersey. Filed June 11, 1904. Serial No. 212,240.

Claim.—1. The process of making pressed sound-records which consists in forming a sheet or tablet of a layer of earth material containing a glaze of hard resisting material which softens under heat, and a layer of similar material containing little or no glaze, heating the two layers together, and pressing the record in the face containing the glaze.



2. The process of making pressed sound-records which consists in forming a sheet of earthy material containing shellac, and another sheet of like material containing little or no shellac, uniting the two layers by means of heat, and pressing the record into the surface containing the shellac.

808,843. METHOD OF MANUFACTURING SOUND-RECORDS. WILLIAM H. HOTT and WILLIAM J. GAVIN, Bridgeport, Conn., assignors to The Bart Company, Hackensack, N. J., a Corporation of New Jersey. Filed Dec. 8, 1904. Serial No. 236,574.



Claim.—1. The method of forming a sound-record tablet by applying upon the surface of the die or matrix a layer of plastic material in a dry and finely-divided state, and a layer of similar material in a plastic state, and uniting the two by heat and pressure.

2. The method of forming a sound-record tablet by applying pressure to two batches or layers of plastic material, one layer being in the form of a dry powder, the other in a plastic condition.

3. The method of forming a compressed sound-record by applying upon the surface of a suitable matrix or die a layer of finely-divided material containing a glaze, applying to said layer a batch of similar material essentially free from glaze, and uniting the two layers by means of heat and pressure.

808,844. VEHICLE-AXLE. Otto Hueck, St. Louis, Mo. Filed July 13, 1905. Serial No. 270,190.

Claim.—A vehicle-axle having a terminal spindle, lobes or arms radiating therefrom at the base thereof, a sleeve passed loosely over the spindle, an enlarged base on the sleeve forming an annular shoulder with the peripheral surface of the sleeve, and having suitable sockets formed therein for the reception of the lobes of the spindle, a key for retaining the sleeve upon the spindle, and a retaining-nut at the outer end of the spindle, the boxing of the wheel-hub being rotatably mounted on the sleeve and confined between the nut and the shoulder formed at the base of the sleeve, substantially as set forth.

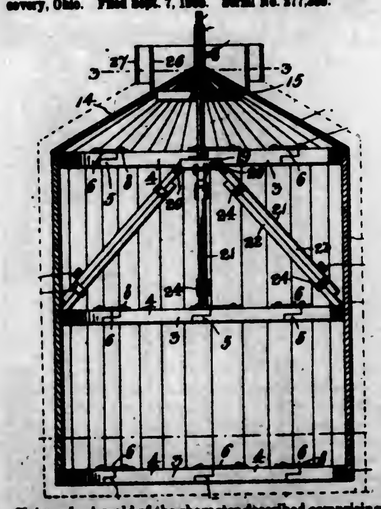
808,845. MEDICINE-SPOON. WILLIAM L. JERKINS, Moultrie, Ga. Filed June 20, 1905. Serial No. 265,896.

Claim.—1. A medicine-spoon embodying a bowl and a handle, the under side of the deepest portion of the bowl and the under side of the handle being in the same plane, and the bowl being provided with interior graduation-marks and with a spout, the under side of which is serrated.

2. A medicine-spoon having its bowl provided with a spout, the under side of which is serrated.

3. A medicine-spoon embodying a bowl and a handle, the bowl being provided with an elongated spout covered throughout a greater portion of its length and having its under side serrated.

808,846. MOLD. JAMES H. JOHNSON and HENRY MEYER, Fort Recovery, Ohio. Filed Sept. 7, 1905. Serial No. 277,269.



Claim.—1. A mold of the character described comprising a plurality of side mold-sections, a pulrality of brace-sections engaged with said mold-sections and having their abutting recessed ends overlapping, latches connecting said abutting ends of the brace-sections, an extension-plate or brace-section pivoted to one of said brace-sections, and a clamp for securing the other end of said extension-section to the adjoining brace-section, substantially as described.

2. A mold of the character described comprising a plurality of side mold-sections, an extension side mold-section closing the space between two of the latter and overlapping the same, and a plurality of substantially scanlor supports or braces, each of the latter comprising a plurality of sections, latches detachably connecting the adjoining ends of said brace-sections, an extension-plate pivoted upon one of said said brace-sections, and a clamp for securing the said plate to the adjoining brace-section, substantially as described.

3. A mold of the character described comprising a plurality of

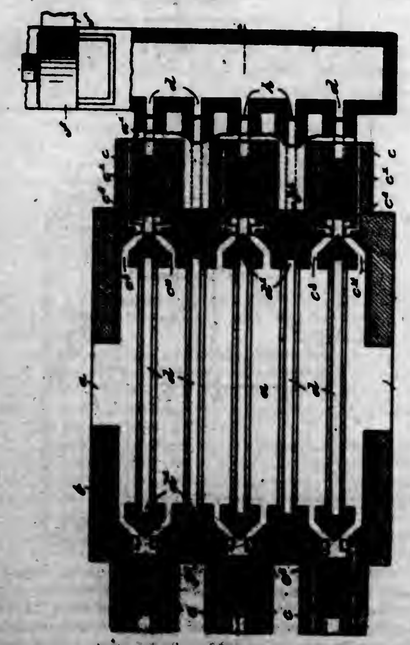
side mold-sections, a support arranged within said mold-sections, an upright, swinging braces upon said upright and adapted to engage said support, a plurality of top mold-sections, and means upon said upright for supporting said top mold-sections.

4. A mold of the character described comprising a plurality of side mold-sections, a support arranged within said mold-sections, an upright, swinging braces upon said upright and adapted to engage said support, a plurality of top mold-sections, and a head adjustable upon said upright for supporting said top mold-sections.

5. A mold of the character described comprising side mold-sections, a substantially annular support within said mold-sections, an upright, a plurality of longitudinally-adjustable braces carried by said upright and engaged with said support, a head slidable upon said upright, and top mold-sections having their lower ends supported by said side mold-sections and their upper portions supported by said head, substantially as described.

6. A mold of the character described comprising side mold-sections, a substantially annular support arranged within said mold-sections, an upright, a plurality of braces pivotally connected to said upright at their upper ends and having their lower ends engaged with said support, each of said braces consisting of slidably-engaged sections, means for securing said brace-sections in an adjusted position, a head slidable upon said upright, a sleeve carried by said head, a stud secured in said sleeve and adapted to engage said upright, a plurality of top mold-sections having their lower ends engaged with said side mold-sections and their upper portions with said head, and an annular band upon said top mold-sections, substantially as described.

808,847. UPDRAFT-KILN. EDWIN A. KING, Philadelphia, Pa. Filed June 5, 1905. Serial No. 263,790.



Claim.—1. An updraft-kiln having a floor or kiln-seat, a series of flues arranged therein, said flues arranged below and opposite the benches of brick placed in said kiln and terminating at the level of the floor so as to be formed by the floor and to be covered at their upper ends by the brick placed on the floor.

2. An updraft-kiln having a floor or kiln-seat, a series of flues arranged therein, said flues arranged below and centrally to the benches of brick placed in the kiln and terminating at the level of the floor so as to be formed by the floor and to be closed at their upper ends by the brick, and a damper arranged in each of said flues and adapted to render the same inoperative, when closing said flues.

3. An updraft-kiln having a floor or kiln-seat, a series of flues arranged therein, flues arranged opposite said floor-flues in the walls of said kiln and forming the continuation thereof, said floor-flues and wall-flues adapted to collect heat from brick placed therein and to conduct the same to the exterior of said kiln.

4. An updraft-kiln having a floor or kiln-seat, a series of flues arranged therein, said flues arranged below and opposite the benches of bricks placed in said kiln and terminating at the level of the floor so as to be formed by the floor and to be closed at their upper ends by the brick, and a main flue communicating with said floor-flues adapted to withdraw and collect heat entering said flues from said kiln.

5. An updraft-kiln having a floor or kiln-seat, a series of flues arranged therein, said flues arranged below and opposite the benches and intermediate the arches of brick therein, flues arranged in the walls of said kiln and forming the continuation of said floor-flues, and a damper arranged in each of said floor-flues adapted to render the same and the wall extensions inoperative, when closing said floor-flues.

6. An updraft-kiln having a floor or kiln-seat, a series of flues arranged therein, said flues arranged below and opposite the benches and intermidate of the arches of brick placed therein, flues extending upwardly from said floor-flues in certain of said walls of said kiln and forming the continuation thereof, said floor-flues and wall extensions adapted to be covered by the brick in said kiln, a damper arranged in each of said floor-flues and adapted to render the same and their wall extensions inoperative, when closing said floor-flues, and a main flue communicating with said floor-flues and adapted to withdraw and conduct heat entering said flues to a place for utilization.

7. An updraft-kiln having a floor or kiln-seat, a series of flues arranged therein, said flues arranged below and opposite the benches and intermediate of the arches of brick placed therein and terminating in the walls of said kiln, flues extending upwardly from said floor-flues in certain of the walls of said kiln and forming the continuation thereof, said floor-flues and their wall extensions adapted to be covered by the brick placed in said kiln, a damper arranged in each of said floor-flues and adapted to render the same and their wall extensions inoperative, when closing said floor-flues, a main flue communicating with said floor-flues and their wall extensions, and exhaust means adapted when actuated to withdraw the heat of said kiln and the brick therein by said floor-flues and their wall extensions and to collect and force the same out of said main flue.

8. An updraft-kiln having a floor or kiln-seat, a series of flues arranged therein, said flues arranged below and opposite the benches and intermediate of the arches of brick placed therein and terminating in the walls of said kiln, flues extending upwardly from said floor-flues in certain of the walls of said kiln and forming the continuation thereof, said floor-flues and their wall extensions adapted to be covered by the brick in said kiln, a damper arranged in each of said floor-flues and adapted to render the same and their wall extensions inoperative, when closing said flues, a main flue communicating with said floor-flues and their wall extensions and exhaust means arranged at the end of said main flue and adapted, when actuated, to withdraw the heat of said kiln and the brick therein by said floor-flues and their wall extensions and to collect and force the same out of said main flue to a place for utilization.

9. An updraft-kiln having a floor or kiln-seat, a series of flues arranged therein, a main flue communicating with said series of flues and exhaust means adapted to withdraw heat from said kiln and to collect the same by said floor-flues in said main flue and to force the heat collected in said main flue to a place for utilization.

808,848. NURSING-BOTTLE HOLDER. PERRY A. A. KILLAM, Ellsworth, Me. Filed May 26, 1905. Serial No. 262,240.

Claim.—1. A device of the class described comprising a base, means carried by the base for holding a bottle, and means pivotally mounted on said base for tilting the latter.

2. A device of the class described comprising a base, and means pivotally mounted on the base for tilting the same both longitudinally and laterally.

3. A device of the class described comprising a base, supporting members pivotally mounted on the base, and means carried by the latter for holding a bottle.

4. A device of the class described comprising a base and a reversible supporting-member pivotally associated with the base for tilting the latter.

5. A device of the class described comprising a base, means carried by the base for holding a bottle, and a plurality of wedge-shaped supporting members pivotally mounted on the base for tilting the said base both longitudinally and laterally.

6. A device of the class described comprising a base, means carried by the base for holding a bottle, and a plurality of supporting members pivotally mounted on the base and pivotally connected to each other.

7. A device of the class described comprising a base, means carried by the base for holding a bottle, and a plurality of supporting members pivotally mounted on the base and having different centers of movement.

8. A device of the class described comprising a base, and a plurality of independently-movable supporting members pivotally mounted on the base and having different centers of movement.

9. A device of the class described comprising a base, and a wedge-shaped supporting member pivotally mounted on the base for tilting the latter.

10. A device of the class described comprising a base, and means pivotally mounted on the base for tilting the same both longitudinally and laterally, said means being reversible to tilt the base either to the right or left.

11. A device of the class described comprising a base provided with a transversely-disposed bottle-receiving compartment, and means carried by the base for tilting the same both longitudinally and laterally.

12. A device of the class described comprising a base provided with a transversely-disposed bottle-receiving compartment, means for retaining the bottle in said compartment, and means secured to the bottom of the base for tilting the same both longitudinally and laterally.

13. A device of the class described comprising a base provided with a bottle-receiving compartment, a strap extending across the compartment for retaining the bottle therein, and supporting members pivotally mounted on the bottom of the base for tilting said base both longitudinally and laterally.

14. A device of the class described comprising a base having one end thereof reduced to form a handle and provided with a bottle-receiving compartment, means for retaining the bottle in said compartment, and a plurality of wedge-shaped supporting members pivotally mounted on the bottom of said base and pivotally connected to each other.

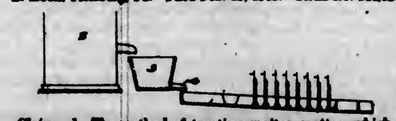
15. A device of the class described comprising a base, a strap secured to the top of the base and defining a bottle-receiving compartment, an elastic strap extending across said compartment for retaining the bottle therein, and means for tilting said base both longitudinally and laterally.

16. A device of the class described comprising a base provided with a bottle-receiving compartment one wall of which is arranged at an angle to the other, means for retaining the bottle in said compartment, and means for tilting the base both longitudinally and laterally.

17. A device of the class described comprising a base provided with a bottle-receiving compartment, and means pivotally mounted on the base for tilting the latter.

18. A device of the class described comprising a base, means carried by the base for holding a bottle, and a plurality of independently-movable supporting members pivotally mounted on the base for tilting the same both longitudinally and laterally.

808,849. METHOD OF TREATING MOLTEN MATTE. WALTER H. KOEN, Pittsburg, Pa. Filed Feb. 10, 1903. Serial No. 144,026.



Claim.—1. The method of treating molten mattes, which consists in forcing gases into a stream of molten matte, and electrolyzing said matte; substantially as described.

2. The method of treating molten mattes, consisting in flowing a stream of molten matte between electrodes, and electrolyzing the matte and simultaneously forcing gases into the stream of matte; substantially as described.

3. The method of treating molten mattes, consisting in electrolyzing the matte by passing a stream of it between electrodes and passing an electric current therethrough, forcing gases into the stream through the electrodes, and splitting the stream to separate one metal from the other; substantially as described.

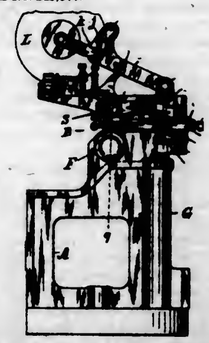
4. The method of treating molten mattes containing copper and iron, consisting in electrolyzing the matte while flowing a stream of the matte between electrodes, and simultaneously forcing gases into the flowing stream; substantially as described.

5. The method of treating molten mattes containing copper and iron, consisting in electrolyzing the matte while flowing a stream of the matte between electrodes and separating the product into portions containing the iron and the copper; substantially as described.

808,850. CHECK-LOOP. WILLIAM C. LARD, Mendota, Ill. Filed Mar. 24, 1904. Serial No. 199,897.

Claim.—A check-loop comprising a metal loop member having its ends disposed in parallel relation with each other, a leather loop member having its ends pressed tightly together and inserted between the ends of said metal loop member, and a metal strap lying close around the leather loop member and having its ends inserted between the ends of said metal loop member, the inner portions of the ends of said metal strap being serrated, so as to bite into the ends of the leather loop member and a plurality of fastening devices extending through the ends of the metal loop member, strap, and leather loop member, substantially as described.

808,851. APPLIANCE FOR CUTTING OFF AND CREASING CIGARETTES. FRANK J. LUDINGTON, Waterbury, Conn. Filed Mar. 14, 1905. Serial No. 249,877.



Claim.—1. In a continuous-cigarette machine, the means for dividing the cigarette-rod, consisting of a standard supporting a driving-shaft with crank-plate upon the shaft, a carriage movable longitudinally upon the standard, a cam-slide movable transversely upon the carriage and provided with a cam-groove, a crank-slide freely movable transversely upon the crank-plate and having a crank-pin fitted to the cam-slide to reciprocate the cam-slide and carriage transversely to one another, a cigarette-cutter mounted upon the carriage, means actuated by the cam-slide for moving the cutter to and from the cigarette-rod, and means fixed upon the standard for governing the transverse movement of the crank-slide.

2. In a continuous-cigarette machine, the means for dividing the cigarette-rod, consisting of a standard supporting a driving-shaft with crank-plate upon the shaft, a carriage movable longitudinally upon the standard, a cam-slide movable transversely upon the carriage, a block adjustable upon the cam-slide and provided with a cam-groove, a crank-slide freely movable transversely upon the crank-plate and having a crank-pin fitted to the cam-slide to reciprocate the cam-slide and carriage transversely to one another, a cigarette-cutter mounted upon the carriage, means actuated by the cam-slide for moving the cutter to and from the cigarette-rod, and means fixed upon the standard for governing the transverse movement of the crank-slide.

3. In a continuous-cigarette machine having a cutter-carriage reciprocated for cutting the cigarette-rod while in motion, the combination, with the carriage, of a slide movable transversely thereon, a crank-plate having a crank-slide with crank-pin fitted to such transverse slide, and a cam for governing the motion of the crank-slide and thereby controlling the velocity of the cutter-carriage at the moment of cutting.

4. In a continuous-cigarette machine having a cutter-carriage reciprocated for cutting the cigarette-rod while in motion, the combination, with the carriage, of a slide transverse to its movement, a crank-plate adjacent to such slide, a crank-slide movable transversely upon the crank-plate with crank-pin journaled to the slide and a cam-stud projected from the opposite side of the crank-slide, and a cam-ring fitted to the stud and held adjustably adjacent to the crank-plate to guide the stud and control the movement of the crank-pin.

5. In a continuous-cigarette machine, the means for dividing the cigarette-rod, consisting of a standard supporting a driving-shaft with crank-plate upon the shaft, a carriage movable longitudinally upon the standard, a cam-slide movable transversely upon the carriage and provided with a cam-groove, a cigarette-cutter mounted upon the carriage, means actuated by the cam-slide for moving the cutter to and from the cigarette-rod, a crank-slide movable transversely upon the crank-plate and having a crank-pin fitted to the cam-slide to reciprocate the slide and carriage transversely to one another, a cam-ring attached to the standard adjacent to the crank-plate, and a stud upon the crank-slide fitted to the cam-groove to control the movement of the crank-pin.

6. In a continuous-cigarette machine, the means for dividing the cigarette-rod, consisting of a standard supporting a driving-shaft, with crank-plate upon the shaft, a carriage movable longitudinally upon the standard, a cam-slide movable transversely upon the carriage and provided with a cam-groove, a cigarette-cutter mounted upon the carriage and means actuated by the cam-slide for moving the cutter to and from the cigarette-rod, a crank-slide movable transversely upon the crank-plate and having a crank-pin fitted to the cam-slide to reciprocate the slide and carriage transversely to one another, a cam-ring secured adjustably upon the standard adjacent to the crank-plate, and a stud upon the crank-slide fitted to the cam-ring to control adjustably the movement of the crank-pin.

7. In a continuous-cigarette machine, the combination, with means for forming the cigarette-rod and dividing the same into cigarettes, of crossing-dies having a channel adapted to clear the body of the cigarette with longitudinal edges adapted to cross the opposite edges of the cigarette-wrapper, and means for operating the crossing-dies.

8. In a continuous-cigarette machine, the combination, with means for forming the cigarette-rod, of a cutter for dividing the cigarette-rod, a carriage for the cutter traversed longitudinally with the cigarette-rod, a cam-slide movable transversely upon the carriage and provided with a cam-groove, a crank having pin fitted to the slide to reciprocate the slide and carriage transversely to one another, means actuated by the cam-slide for moving the cutter to and from the cigarette-rod, a guide upon the carriage to support the cigarette when divided by the cutter, a crossing-die fixed upon the carriage adjacent to such guide to receive the cigarettes successively, a crossing-die movable to and from the same and means actuated by the cam-slide for moving such crossing-die.

9. In a continuous-cigarette machine, the combination, with means for forming the cigarette-rod and dividing the same into cigarettes, of a cutter for dividing the cigarette-rod, a carriage for the cutter traversed longitudinally with the cigarette-rod, a cam-slide movable transversely upon the carriage and provided with a cam-groove, a crank having pin fitted to the slide to reciprocate the slide and carriage transversely to one another, means actuated by the cam-slide for moving the cutter to and from the cigarette-rod, a guide upon the carriage to support the cigarette when divided by the cutter, a crossing-die fixed upon the carriage adjacent to such guide to receive the cigarettes successively, a crossing-die movable to and from the same, a lever *r* pivoted upon the carriage and moved by the cam-slide to actuate such die, and an adjustable connection between such die and the lever to operate the die as desired.

10. In a continuous-cigarette machine, the combination, with means for forming the cigarette-rod, of a cutter for dividing the cigarette-rod, a carriage for the cutter traversed longitudinally with the cigarette-rod, a slide movable transversely upon the carriage and provided with a cam-groove, a crank having pin fitted to the slide to reciprocate the slide and carriage transversely to one another, a rocker-dog journaled upon the carriage with arm oscillated with the cam-groove, a cutter-frame pivoted on the carriage with a cutter having spindle journaled therein, a guide upon the carriage to support the cigarette when divided by the cutter, a crossing-die supported upon the carriage adjacent to such guide to receive the cigarette successively, a crossing-die movable to and from the same, a toe upon the rocker-dog to actuate such movable die, and an adjustable connection between such die and the toe, to adjust the movable die as desired.

11. In a continuous-cigarette machine, the combination, with the means for forming the cigarette-rod, of a cutter-carriage traversed longitudinally with the cigarette-rod, a cutter-frame pivoted upon the carriage, a cutter-spindle journaled upon the cutter-frame with rotary cutter thereon, a slide movable transversely upon the carriage and provided with a cam-groove, a crank having pin fitted to the slide to reciprocate the slide and carriage transversely to one another, a rocker-dog journaled upon the carriage with arm oscillated by the cam-groove; the toe c^3 upon the rocker-dog, and an adjustable connection between the toe and the cutter-frame to compensate for the wear and gradual reduction of the cutter.

12. In a continuous-cigarette machine, the combination, with the means for forming the cigarette-rod, of a cutter-carriage having a cigarette-guide traversed longitudinally with the cigarette-rod, the cutter-frame J journaled to the pivot H upon the carriage and pressed normally toward the cigarette-guide, a cutter-spindle journaled upon the cutter-frame with rotary cutter thereon, a cam-slide movable transversely upon the carriage and provided with a cam-groove, a crank having a pin fitted to the cam-slide to reciprocate the cam-slide and carriage transversely to one another, a rocker-dog journaled upon the carriage with arm oscillated by the cam-groove, the toe c^3 upon the rocker-dog, and the arm I′ hinged upon the pivot H and having roll I² to contact with the toe c^3 and connected adjustably with the cutter-frame, as and for the purpose set forth.

13. In a continuous-cigarette machine, the combination, with means for forming and propelling the cigarette-rod, of a cutter for dividing the cigarette-rod, a carriage for the cutter, the guide M provided with ledger-plate tube N adjacent to the path of the cutter, the ledger-plate tube having in the bottom the slot *n* to discharge any chips received with the cut cigarettes, and dies arranged adjacent to the ledger-plate tube to crease the cigarettes received therefrom, the guide M, the ledger-plate tube N and the dies being supported by the cutter-carriage and reciprocated therewith, substantially as herein described.

14. In a continuous-cigarette machine, the combination, with a suitable standard, of a cutter-carriage having a cigarette-guide traversed longitudinally with the cigarette-rod, a cutter mounted upon the carriage, means for reciprocating the carriage upon the standard and for actuating the cutter, a double-ended plunger movable with the carriage, and the air-chambers F arranged upon the standard to continuously engage the ends of the plunger and regulate the movements of the carriage throughout its entire stroke, substantially as herein set forth.

15. In a continuous-cigarette machine, the combination, with a suitable standard, of a cutter-carriage having a cigarette-guide traversed longitudinally with the cigarette-rod, a cutter mounted upon the carriage, means for reciprocating the carriage upon the standard and for actuating the cutter, the carriage having the ears D projected toward the top of the standard and provided with the double-ended plunger E, and the standard having the lugs F′ projected toward the carriage and provided with the air-chambers F in continuous engagement with the ends of the plunger E, to regulate the movements of the carriage throughout its entire stroke.

16. In a continuous-cigarette machine, the combination, with a suitable standard, of a cutter-carriage having a cigarette-guide traversed longitudinally with the cigarette-rod, a cutter mounted upon the carriage, means for reciprocating the carriage upon the standard and for actuating the cutter, the carriage having the ears D projected toward the top of the standard and provided with the double-ended plunger E having recesses *e* in the ends, and the standard having the lugs F′ projected toward the carriage and provided with the air-chambers F in continuous engagement with the ends of the plunger E, to regulate the movements of the carriage throughout its entire stroke.

17. In a continuous-cigarette machine the means for dividing the cigarette-rod and crossing the wrapper, consisting of a carriage, a cutter supported movably upon the carriage, crossing-dies supported upon the carriage in the path of the cigarette, a slide fitted transversely upon the carriage with adjustable connections to the cutter and to the movable crossing-die, a crank-plate having crank-slide fitted transversely thereon with a crank-pin engaging the transverse slide upon the carriage, and means for adjusting the movement of the crank-pin, whereby the operation of the crank-pin, the cutter and the crossing-die may all be adjusted in relation to one another.

808,852. **TROLLEY DEVICE.** FRANK J. LINDOLPH, Rochester, N. Y. Filed July 15, 1905. Serial No. 270,217.

Claim.—1. A trolley device comprising, in combination with the pole, a harp in two separable parts or sections for holding the wheel, the two parts of the harp having mutually-interlocking elements between the wheel-bearing and the outer end of the harp for preventing their separation.

2. A trolley device comprising, in combination with the pole, a harp in two separable parts or members for holding the wheel, the two parts of the harp being divided along the axis of the wheel and having mutually-interlocking elements between the wheel-bearing and the outer end of the harp, and means for holding the two parts together.

3. A trolley device comprising a divided harp for holding the wheel, with half the axle bearing of the wheel in each part of the harp, one part of the harp having cavities and the other part having spurs to enter said cavities, and means for holding the parts of the harp together to act as a single piece, said cavities and spurs being disposed between the wheel-bearing and the outer end of the harp.

4. A trolley device comprising a two-part harp with wheel, each part having both an opening and a projecting portion, said opening and projecting part being between the wheel-bearing and the outer end of the harp, the projecting portion of each part of the harp occupying the opening in the other, and means for holding said parts of the harp together.

5. A trolley device comprising a bifurcated harp in two separable parts divided through the axle of the wheel, the axle of the wheel having a bearing in the branches of the harp on either side of the wheel, one of said parts of the harp having cavities adjacent to the axle, between the wheel-bearing and the outer end of the harp, and movable bearing-blocks for the axle in said cavities.

6. A trolley device comprising a bifurcated harp in two separable parts divided through the axle of the wheel, and having mutually-interlocking elements between the wheel-bearing and the outer end of the harp, the axle of the wheel having a bearing in the branches of the harp on either side of the wheel, one of said parts of the harp having removable bearing-blocks, and the other part having cavities adjacent to the axle for holding an absorbent.

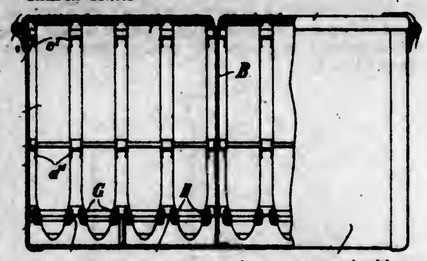
808,853. **BOILER-SETTING AND BLOCKS THEREFOR.** HENRY S. HARRIS, Reading, England. Filed Aug. 10, 1904. Serial No. 220,220.

Claim.—1. A removable covering or seating for steam-boilers, capable of removal without necessitating interference with the adjacent structure, comprising series of blocks having means for effecting temporary joints between their adjacent edges and recesses in some of the blocks for the reception of a key, substantially as and for the purpose hereinbefore described.

2. A removable covering or seating for steam-boilers, capable of removal without necessitating interference with the adjacent structure, comprising series of blocks having rabbeted adjacent edges and recesses in some of the blocks for a key, substantially as and for the purpose hereinbefore described.

3. A removable covering for steam-boilers, capable of removal without necessitating interference with the adjacent structure comprising series of blocks *b* having rabbeted adjacent edges *i* with lips *j*, and key-recesses *f*, substantially as and for the purpose described.

808,854. **AMMUNITION-PACKAGE.** WILHELM HAYER, Rotthausen, near Essen-on-the-Ruhr, Germany, assignor to Fried. Krupp, Aktiengesellschaft, Essen-on-the-Ruhr, Germany. Filed Feb. 20, 1905. Serial No. 246,052.



Claim.—1. An ammunition-package constructed with a seat and having an elastic cushion in said seat conforming to the projectile to be inserted therein.

2. An ammunition-package comprising a suitable receptacle, bearings in said receptacle into which cartridges are introduced, seats in said receptacle, receiving the projectiles of said cartridges, and cushions in said seats.

3. An ammunition-package comprising a suitable receptacle, bearings in said receptacle into which cartridges are introduced, seats in said receptacle, receiving the projectiles of said cartridges, and cushions in said seats; said cushions being provided with metallic linings conforming to the portion of the projectile resting therein.

4. An ammunition-package comprising a suitable receptacle, bearings in said receptacle into which cartridges are introduced, seats in said receptacle, receiving the projectiles of said cartridges, and cushions in said seats; said cushions being formed to engage beneath portions of the seats to retain the cushions in position.

5. An ammunition-package comprising a suitable receptacle, bearings in said receptacle into which cartridges are introduced, seats in said receptacle, receiving the projectiles of said cartridges, and cushions in said seats; said cushions being provided with metallic linings conforming to the portion of the projectile resting therein and said cushions and linings being secured in relative position by concave and convex faces.

6. An ammunition-package comprising a suitable receptacle, bearings in said receptacle into which cartridges are introduced, seats in said receptacle, receiving the projectiles of said cartridges, and cushions in said seats; said cushions being provided with metallic linings conforming to the portion of the projectile resting therein and said linings being provided with collars overlapping the cushions.

7. In a package for ammunition, the combination with the receptacle; of a partition having seats pressed therein to receive the projectiles of the ammunition, and elastic gaskets fitted in said seats to cushion the projectiles, and formed with shoulders engaging beneath the lower edges of the seats to retain the gaskets in place.

8. In an ammunition-package, the combination of a receptacle, partitions therein formed respectively with bearings, through which the cartridges are inserted and seats in which the projectiles are supported; said seats being provided with cushions.

9. In an ammunition-package, the combination of a receptacle, upper, lower and intermediate partitions therein, bearings formed in the upper and intermediate partitions, through which cartridges are introduced, and cushioned seats formed in the lower partition, to receive the ends of the projectiles; the intermediate partition being located below the upper ends of the projectiles, to sustain said projectiles laterally.

10. An elastic non-metallic cushion for ammunition-packages constructed to receive the end of the projectile, and having a metallic lining conforming to a face of a projectile.

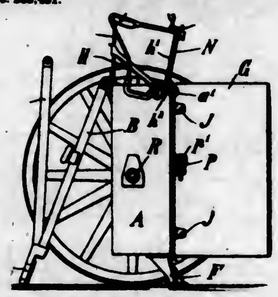
11. An elastic cushion for ammunition-packages constructed to receive the end of a projectile and having compressible means adapted to expand after compression and to engage a seat in an ammunition-package to hold it in place within a package.

12. An elastic cushion for ammunition-packages constructed to receive the end of a projectile and having an annular shoulder

adapted to be compressed and to expand after compression to hold it within a seat in an ammunition-package.

13. An elastic cushion for ammunition-packages comprising a gasket constructed to receive the end of a projectile, having means for holding it within a seat in the package, and a metallic lining for the gasket, having a face conforming to an inclined face on a projectile, the lining being concave on one face and the gasket being convex on one of its faces to hold the two parts together.

808,855. **TILTING AMMUNITION-WAGON.** WILHELM MAYER, Essen-on-the-Ruhr-Rüttenscheid, Germany, assignor to Fried. Krupp Aktiengesellschaft, Essen-on-the-Ruhr, Germany. Filed May 8, 1905. Serial No. 259,481.



Claim.—1. In an ammunition-wagon, the combination with the tilting box movable to a vertical position, and having hinged doors, of a seat swingingly mounted on the front end of the box and adapted to rest on the upper ends of the doors to protect the serving crew against steep-falling projectiles.

2. In an ammunition-wagon, the combination with the box having a door, of a seat swingingly mounted on the front end of the box and adapted to rest upon the door, and means for securing the door and the seat to one another.

3. In an ammunition-wagon, the combination with the tilting box movable to a vertical position, of a seat normally resting upon the box and swingingly mounted on the front end of the same to be thrown upwardly when the box is in a vertical position to enlarge the protected space behind the wagon.

4. In an ammunition-wagon, the combination of a tilting box having a door, of a seat normally resting on said door to close the same and capable of being swung relatively to the box to permit of the door being opened.

808,856. **FERTILIZER AND SEED DISTRIBUTER.** HENRY C. HELTON, Wharnboro, Tex., assignor of four-ninths to James F. Turner, Wharnboro, Tex., and three-ninths to Robert S. Bass, Greenville, Tex. Filed May 24, 1905. Serial No. 261,300.

Claim.—1. In a fertilizer and seed distributer, a funnel-shaped casing having a cylindrical exit-tube, in combination with a plunger comprising a rod having a conical piston.

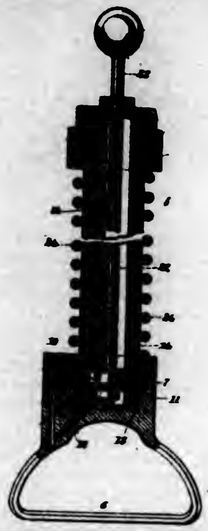
2. In a fertilizer and seed distributer, a funnel-shaped casing having a cylindrical exit-tube, in combination with a plunger comprising a rod having a piston and provided with a spirally-disposed flange adjacent to said piston.

3. In a fertilizer and seed distributer, a funnel-shaped casing having an exit-tube and a plunger comprising a rod, a conical piston at the end of said rod, and a spiral flange upon said rod adjacent to the piston.

4. In a device of the class described, a funnel-shaped casing having an exit-tube and a plunger comprising a rod having a conical piston, a wire wound upon said rod adjacent to the piston and constituting a spiral flange, and transversely-disposed agitating members.

5. In a device of the class described, a conical casing having a cylindrical discharge-tube, a supporting-bail and a handle; in combination with a plunger comprising a rod having a conical piston provided with a covering of flexible material, a spiral flange adjacent to said piston, and transverse agitating members.

808,857. **PUMP.** ARTHUR K. MILLER, Peekskill, N. Y. Filed Apr. 14, 1903. Serial No. 152,552.



Claim.—1. A pump comprising a casing open at its ends, a piston and rod, a support for said casing having a socket therein and adapted for securement to the lower end of said casing, and having an annular recess at its upper edge, a cap adapted for securement to the upper end of said casing having an annular recess at its lower edge, and a volute spring disposed about said casing and having its ends bearing against and confined by the recesses in said cap and socket, substantially as specified.

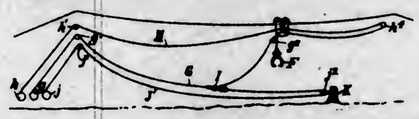
2. A pump comprising a casing open at its ends, a piston and rod, a support for said casing having a socket therein and adapted for securement to said casing; a shoulder in said socket above the lower end of said casing, a cap adapted for securement to the upper end of said casing, a shoulder in said socket below the upper edge of said casing, and a volute spring disposed about said cylinder and having its ends confined within the sockets of said support and cap and bearing against the shoulders therein, substantially as specified.

3. A pump comprising a casing open at its ends, screw-threads upon said casing at its ends, a piston and rod, a support for said casing having a socket therein consisting of a screw-threaded portion adapted to engage the threaded end of said casing, and a larger unthreaded portion adjoining the same, an annular packing in the base of said socket, a cap having a socket in its under side consisting of a screw-threaded portion adapted to engage the threaded upper end of said casing, and an unthreaded larger portion adjoining the same, and a volute spring disposed about said casing, having its ends disposed within the larger opposing portions of the sockets in the cap and support, and bearing upon the shoulders therein, substantially as specified.

4. A pump comprising a casing open at its ends, screw-threads upon the outer surface of said casing at the ends thereof, a piston and rod, a support for said casing having a socket therein comprising a screw-threaded portion adapted to engage the screw-threads at the lower end of the casing, a larger portion adjoining said screw-threaded portion, and a shoulder intermediate said socket portions, an annular packing disposed in the base of the threaded portion of said socket, a cap having a socket in its under side comprising a screw-threaded portion adapted to engage the threaded upper end of the casing, and a larger portion adjoining said threaded portion, a shoulder provided intermediate said socket portions, and a volute spring disposed under compression about said cylinder and having its ends confined by said enlarged socket portions of said cap and support and bearing against the shoulders thereon, substantially as specified.

5. A pump comprising a casing open at its ends, screw-threads upon the outer surface of said casing at its ends an outlet-port for said casing, a piston and rod, a support for said casing having a socket therein comprising a threaded portion of substantially the diameter of the casing, adapted to engage the threaded house end thereof, and a smooth portion of greater diameter than said casing adjoining said threaded portion, an annular packing disposed in the base of the threaded portion, a cap having a socket therein comprising a threaded portion of substantially the diameter of the casing, adapted to engage the screw-threaded upper end thereof, and a smooth portion of greater diameter than said casing adjoining said threaded portion, and a volute spring disposed about said casing having its ends confined by the sockets in said support and cap, and bearing against the portion intermediate the smooth and threaded portions thereof, substantially as specified.

808,858. **CONVEYER.** THOMAS S. MILLER, South Orange, and JAMES H. DOUGHERTY, Montclair, N. J. Filed Feb. 20, 1904. Serial No. 194,726.



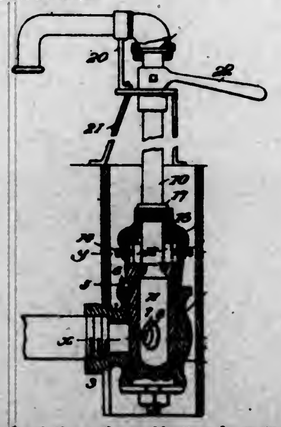
Claim.—1. In a conveying device, in combination, a load-pulling rope, a carriage, carriage-traversing means, a stationary anchorage, an outhaul-rope actuator and an outhaul-rope extension from said actuator to said anchorage and thence to a point of attachment with the load-pulling rope back of said carriage.

2. In a conveying device, in combination, a load-pulling rope, a carriage, carriage-traversing means, a clamp for detachably securing said load-pulling rope back of the carriage, and an outhaul-rope extending from said clamp downwardly and an outhaul-rope actuator.

3. In a conveying device, in combination, a load-pulling rope, a carriage, carriage-traversing means, an outhaul-rope extending from a point of said load-pulling rope back of the carriage downwardly and an outhaul-rope actuator.

4. In a conveying device, in combination, a load-pulling rope, a carriage, carriage-traversing means, an outhaul-rope, a clamp detachably securing said outhaul-rope to said load-pulling rope back of the carriage, a sheave supported independently of the carriage over which said outhaul-rope extends and an outhaul-rope actuator.

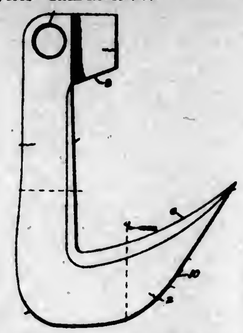
808,859. **HYDRANT.** VIRGIL H. MILLS, Hubbard, Tex. Filed Dec. 14, 1904. Serial No. 236,838.



Claim.—1. In a hydrant, the combination of a waste-cock having a turn-plug provided with a recess in its upper end in communication with the interior of said plug, a pipe having its lower end inserted in said recess, clamp-blocks at opposite sides of the recess, set-screws threaded to the plug and adapted to force the clamp-blocks in engagement with the pipe to grip the latter, and a fitting for securing a tight joint between the pipe and plug.

2. In a hydrant, the combination of a waste-cock provided with a turn-plug having a recess in its upper end provided with guides at opposite points, clamp-blocks held in place by said guides, set-screws for forcing the clamp-blocks inward, a pipe having its lower end inserted in said recess and held fast by the clamp-blocks, and means for maintaining a tight joint between said pipe and plug, substantially as set forth.

808,860. **GRAB-HOOK.** FREDERICK J. MORRISON, Emporium, Pa. Filed Apr. 20, 1905. Serial No. 256,290.



Claim.—1. A grab-hook comprising a shank having an eye in one end and a bill at the opposite end, the outer end of the bill being formed into a chisel-point from which the bill decreases in width and then increases in width until it merges into the shank.

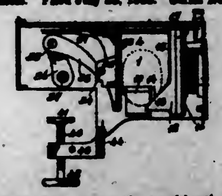
2. A grab-hook comprising a shank having an eye in one end and a bill at the other end thereof, the inner edge of the bill being beveled to form a longitudinal cutting edge.

3. A grab-hook comprising a shank having an eye at one end and a bill at the other end, the outer end of the bill terminating in a chisel-point from which the bill decreases in width and then increases in width until it merges into the shank, the inner edge of the bill being beveled to form a longitudinal cutting edge terminating at the point where the end of the bill is flattened to form the chisel-point.

4. A grab-hook comprising a shank having an eye at one end and a bill at the other end thereof, the inner edge of the bill and the front edge of the shank being beveled to form cutting edges extending one into the other.

5. A grab-hook comprising a shank provided at one end with an eye and a tapered blade projecting forwardly of the front edge of the shank in alinement with the eye, the opposite end of the shank being provided with a bill with the heel portion between the bill and the shank laterally enlarged, the outer end of the bill terminating in a chisel-point from which it decreases in width and then increases in width until it merges into the shank, the front edge of the shank and the inner edge of the bill being beveled to form longitudinal cutting edges extending one into the other and the bill being beveled outwardly to form an outer cutting edge, the inner and outer cutting edges of the bill terminating at the point where the extremity of the bill is flattened to form the chisel-point.

808,861. **FRUIT-SQUEEZER.** DENNIS H. MOUTRAIE, Chicago, Ill., assignor to Moutrie Manufacturing Company, Chicago, Ill., a Corporation of Illinois. Filed July 25, 1905. Serial No. 271,171.



Claim.—1. In a fruit-squeezer, the combination of a casing, a squeezer-plate within the casing, a resilient mounting for the squeezer-plate, a presser-plate in parallel relation to the squeezer-plate and relatively movable with respect thereto, and means for moving the presser-plate, substantially as described.

2. In a fruit-squeezer, the combination of a casing, a squeezer-plate, a knife secured to the squeezer-plate and terminating in a forwardly-projecting sloping toe having a dull edge, a presser-plate provided in its front face with a slot adapted to register with the knife, and means for moving the presser-plate with respect to the squeezer-plate, substantially as described.

3. In a fruit-squeezer, the combination of a casing, two plates within the casing, one of the plates being movable with respect to the other, a knife secured to the face of one of the plates and provided at its lower end with an inwardly-projecting beveled toe having a dull edge, said knife being adapted to register with a slot in the face of the other plate, and means for moving one of the plates relatively with respect to the other, substantially as described.

4. In a fruit-squeezer, the combination of a casing, a squeezer-plate slidably mounted within the casing, vertically-extending flanges adapted to bear against the acting face of the squeezer-plate, blocks of resilient material bearing against the rear face of the squeezer-plate, a presser-plate slidably mounted with respect to the squeezer-plate, a link pivoted to the presser-plate, an arm to which the link is pivoted, a shaft to which the arm is secured, and a handle for moving the shaft, substantially as described.

5. In a fruit-squeezer, the combination of a casing, a squeezer-plate slidably mounted within the casing, vertically-extending flanges adapted to bear against the acting face of the squeezer-plate, blocks of resilient material bearing against the rear face of the squeezer-plate, a presser-plate slidably mounted with respect to the squeezer-plate, a link pivoted to the presser-plate, an arm to which the link is pivoted, a shaft to which the arm is secured, a handle for moving the shaft, and a knife on the squeezer-plate terminating in a forwardly-projecting beveled toe provided with a dull edge and adapted to register with a slot in the face of the presser-plate, substantially as described.

6. In a fruit-squeezer, the combination of a casing provided along its side walls with longitudinally-extending flanges, a cover for the casing adapted in combination with the flanges to form channels or guideways, a presser-plate provided with side flanges adapted to enter the channels or guideways, said presser-plate being provided in its front face with a slot having the adjacent walls of the plate inwardly beveled to the slot, means for reciprocating the presser-plate, a squeezer-plate, a knife secured to the squeezer-plate and provided with a forwardly-extending beveled toe having a dull edge and adapted to register with the slot in the presser-plate, substantially as described.

7. In a fruit-squeezer, the combination of a casing provided along its side walls with longitudinally-extending flanges, a cover for the casing adapted in combination with the flanges to form channels or guideways, a presser-plate provided with side flanges adapted to enter the channels or guideways, said presser-plate being provided in its front face with a slot having the adjacent walls of the plate inwardly beveled to the slot, means for reciprocating the presser-plate, a squeezer-plate, a knife secured to the squeezer-plate and provided with a forwardly-extending beveled toe having a dull edge and adapted to register with the slot in the presser-plate, and downwardly-converging plates or rests secured to the side walls of the casing and adapted in combination with the toe of the knife to form a support for the fruit prior to the cutting operation, substantially as described.

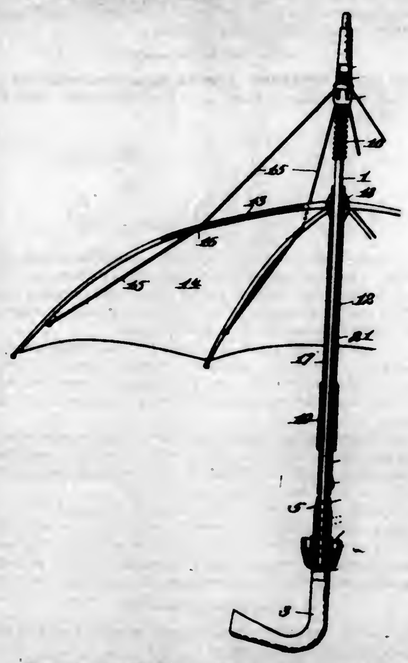
8. In a fruit-squeezer, the combination of a casing, a squeezer-plate within the casing, a cutter-plate relatively movable with respect thereto, a sloping trough below the plates, and a squeezer-plate within the trough provided with a series of transversely-extending slots, each slot having at its upper edge a downwardly-turned flange for directing the juice through the slots, substantially as described.

808,862. SPIRIT-LEVEL. JOHN A. MCCABE, Atlanta, Ga., assignor of one-half to LOUIS J. GUNSTE, Decatur, Ga. Filed Apr. 8, 1905. Serial No. 254,877.

Claim.—1. A leveling and plumbing instrument consisting of a bar having a chamber therein, a bevel pivoted within said chamber, a shaft extending transversely through said chamber and through the bar, a cam on the shaft below the level, and a pointer on said shaft outside the bar, the latter having a graduated scale adjacent to the pointer, substantially as described.

2. The combination of the chambered bar, a level pivoted therein, a shaft extending through the bar and provided with a cam on which the level rests, with a pointer, and with a shoulder opposite the inner wall of the chamber, and a nut on the shaft whereby said shoulder may be brought into frictional contact with the said wall, substantially as described.

808,863. UMBRELLA. REUBEN G. MCGUIRE, Chicago, Ill. Filed Mar. 11, 1905. Serial No. 249,647.



Claim.—1. An umbrella comprising a stick, a support fixed to one end thereof, a slidable sleeve mounted upon said stick, ribs connected to one end of said sleeve, flexible braces connected to the ribs and to the said support, said ribs adapted to be spread when the sleeve is moved toward the handle end of the stick, and a spring mounted upon said stick and interposed between said support and that end of the sleeve to which the ribs are connected.

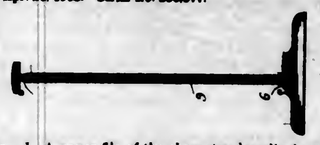
2. An umbrella comprising a stick, a support fixed to one end thereof, a slidable sleeve mounted upon said stick, ribs connected to one end of said sleeve, flexible braces connected to the ribs and to the said support, said ribs adapted to be spread when the sleeve is moved toward the handle end of the stick, a spring mounted upon said stick and interposed between said support and that end of the sleeve to which the ribs are connected, and a latch carried by the stick near the handle end thereof and adapted to project through the sleeve for retaining the umbrella in an extended position.

3. An umbrella comprising a stick, a support fixed to one end thereof, a slidable sleeve mounted upon the stick and when moved toward the other end thereof adapted to open the umbrella, ribs connected to one end of said sleeve, flexible braces having one end connected to the ribs at a point intermediate the ends thereof and the other end connected to said support, and a spring interposed between said support and that end of the sleeve to which the ribs are connected.

4. An umbrella comprising a stick, a support fixed to one end thereof, a slidable sleeve mounted upon the stick and when moved toward the other end thereof adapted to open the umbrella, ribs connected to one end of said sleeve, flexible braces having one end connected to the ribs at a point intermediate the ends thereof and the other end connected to said support, a spring interposed between said support and that end of the sleeve to which the ribs are connected, and a latch carried by the stick and adapted to project through the sleeve for retaining the umbrella in an extended position.

5. An umbrella comprising a stick provided at one end with a ferrule and at its other end with a handle, an elongated sleeve mounted upon said stick and movable toward the handle end of the stick for opening the umbrella, a latch carried by the stick near the handle end thereof and adapted to project through the sleeve for retaining the umbrella in an extended position, a support fixed to said stick in close proximity to the ferrule, ribs pivotally connected to one end of the sleeve, and braces having one end connected to said support and the other end secured to the ribs at a point intermediate the ends thereof.

808,864. PAPER-FILE. LUTHER B. MCLAUGHLIN, Prisoberg, Pa. Filed Apr. 20, 1905. Serial No. 256,577.

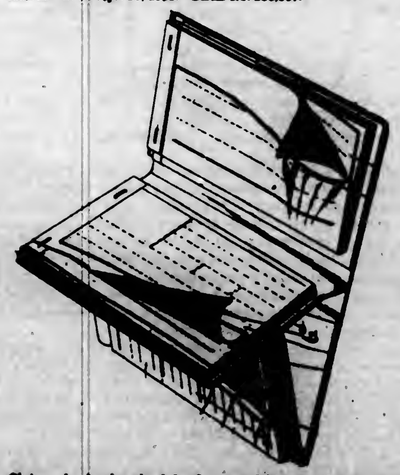


Claim.—1. A paper-file of the character described, comprising a bore having formed therein a vertically and an obliquely disposed aperture, and a filing element adapted to be removably engaged with one or the other of the apertures in said base, substantially as described.

2. A paper-file of the character described, comprising a base having formed therein vertically and obliquely disposed apertures, a filing-tube adapted to be engaged with one or the other of the apertures in said base, and a holding-pin adapted to be removably inserted in and engaged with said filing-tube, substantially as described.

3. A paper-file of the character described, comprising a base having formed therein vertically and obliquely disposed threaded apertures, a filing-tube having exterior screw-threads formed on one end thereof to engage the threads in one or the other of the apertures in said base, interior screw-threads formed in the opposite end of said tube, a holding-pin adapted to be inserted in said tube, threads formed on said pin to engage the interior threads in the end of said filing-tube and a head formed on the outer end of said pin, substantially as described.

808,865. SALES-CHECK BOOK. ARCHIBALD L. MCLEESE, Glenco, Ill. Filed Apr. 17, 1905. Serial No. 256,057.



Claim.—1. A sales-check book, comprising a section or support having a second section flexibly connected to one edge thereof and having two other sections each flexibly connected with the first section at the opposite edge thereof, three of said sections being provided with blank-retaining means, and pads of blanks detachably secured to said sections.

2. A sales-check book, comprising a leaf or section provided with a marginal flange extending in a plane substantially perpendicular to the face of said leaf, a second leaf flexibly connected with one edge of said first leaf and provided with means for retaining a pad of blanks, and two other sections or leaves flexibly connected with another edge of said first-named leaf, said two other sections being provided respectively with means for retaining pads of blanks.

3. A sales-check book, comprising a support having a second support connected with one edge thereof, said second support being provided with means for removably retaining a pad of blanks, two other supports, each connected with the opposite edge of said first-named support and provided, respectively, with means for removably retaining pads of blanks.

4. A sales-check book, comprising a leaf or support having another leaf or support connected with one margin thereof and having two other leaves or supports connected with another margin thereof, said two last-named leaves being connected with each other at their respective edges, which are adjacent to one edge of said first-named leaf, and each having means for removably holding a pad of blanks.

5. A sales-check book, comprising a section provided with a marginal flange extending in a plane substantially perpendicular to the face of said section, a second section flexibly connected with one edge of said first section and also provided with a marginal flange and with means for receiving and holding a pad of blanks, two other sections flexibly connected with another edge of said first-named section, both of said last-named sections being provided with means for retaining pads of blanks and with marginal flanges extending in a plane substantially perpendicular to the faces of said sections.

6. A sales-check book, comprising a series of sections, provided with marginal flanges extending in a plane substantially perpendicular to the faces of said sections, one of said sections being provided with means for retaining a pad of blanks, a pad of blanks detachably secured thereto, said pad comprising a series of sheets in triplicate and having secured thereto a carbon-sheet, two additional sections secured to the first-named sections and provided with means for retaining pads of blanks, pads of blanks in triplicate, of different colors, attached to said sections, and sheets of carbon-paper detachably secured to both of said sections.

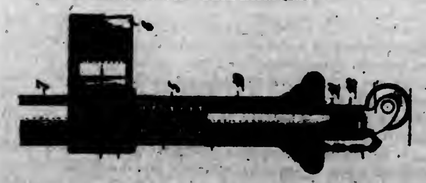
7. A sales-check book, comprising a support or section provided at one edge with a flange extending perpendicularly to the face thereof, a second section flexibly secured to said first section at another edge thereof and provided with means for retaining a pad of blanks with its bound edge in a position adjacent to said flange when said sections are folded together.

8. A sales-check book, comprising a section or support having a second section flexibly connected to one edge thereof and having two other sections each flexibly connected with the first section at another edge thereof one of said sections having means for removably holding a pad of blanks.

9. In a sales-check book or the like, the combination of a pair of covers hingingly secured together at adjacent edges, a pad of blanks removably secured to the inner side of one of the covers, a leaf hinged to the free edge of the other cover, a pad of blanks removably secured to said leaf, a leaf hinged to said covers along a line between their adjacent edges, and a pad of blanks removably secured to said last-named leaf.

10. In a sales-check book or the like, the combination of a pair of covers hingingly secured together at adjacent edges, one of said covers having means for removably holding a pad of blanks, a leaf hinged to the other cover, said leaf having means for removably holding a pad of blanks, and a leaf secured between said covers along a line between their adjacent edges and having means for removably holding a pad of blanks.

808,866. METALLIC BEDSTEAD. PETER P. OSBAUER, Buffalo, N. Y. Filed Aug. 15, 1905. Serial No. 274,966.



Claim.—1. A bedstead comprising hollow corner-posts and side rails rigidly connected and each corner-post provided with an internal abutment, slidable sleeves fitting into said posts and internally threaded at their outer ends, castors having threaded shanks fitting

into the threaded ends of said sleeves, and springs interposed between the abutments and the inner ends of said sleeves.

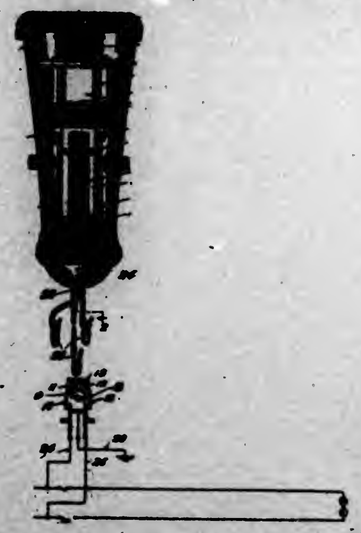
2. A bedstead comprising hollow corner-posts and side rails rigidly connected and each corner-post provided with an internal abutment, slidable sleeves fitting into said posts and internally threaded at their outer ends, casters having threaded shanks fitting into the threaded ends of said sleeves, springs interposed between the abutments and the inner ends of said sleeves, and means to prevent unintentional dislodgment of said sleeves and springs from the corner-posts when lifting the bedstead.

3. A bedstead comprising hollow corner-posts and side rails rigidly connected and each corner-post provided with an internal abutment, slidable sleeves fitting into said posts and internally threaded at their outer ends, casters having threaded shanks fitting into the threaded ends of said sleeves, springs interposed between the abutments and the inner ends of said sleeves, and a chain connecting each corner-post with its corresponding caster.

808,867. BADGE. DUDE W. PERRY, Keene, N. H. Filed May 26, 1905. Serial No. 262,176.

Claim.—An article of manufacture, consisting of a badge having a shank member provided with a threaded stud and projection; a cover-plate having an inwardly-projecting central portion internally threaded; a projecting rim on said central projecting portion; an annular inwardly-projecting rim on said cover-plate; an inscription-disk formed to fit within the annular rim of the cover-plate; and a spring member formed to spring over the rib of the projecting central portion of the cover-plate to retain the inscription-plate in place.

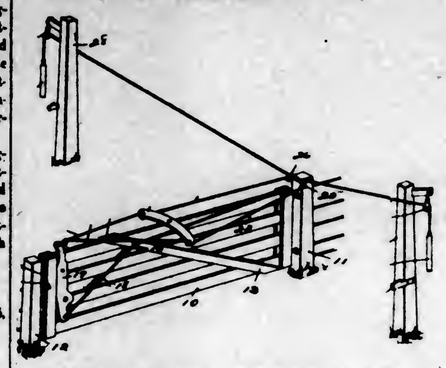
808,868. TELEPHONE SIGNALING APPARATUS. KARL H. POTAS, Los Angeles, Cal. Filed July 24, 1905. Serial No. 270,960.



Claim.—1. In a telephonic receiving instrument of the character herein described, a base of insulating material in said instrument, two normally closed manually-operated make-and-break switches mounted on said base and forming a part of the instrument-circuit, one switch in each branch thereof, a ground-plate secured to said base at a point to be engaged by said switches when the same are moved to open the circuit and a connection from said plate to ground.

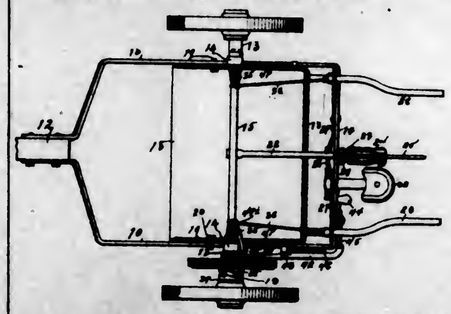
2. In a telephonic receiving instrument of the character herein described, a base of insulating material in said instrument, two normally closed manually-operated make-and-break spring-switches mounted on said base and forming a part of the instrument-circuit, one switch in each branch thereof, a ground-plate secured to said base as a gasket to be engaged by said switches when the same are moved to open the circuit and a connection from said plate to ground.

808,869. FARM-GATE. CHARLES R. PERRY, Des Moines, Iowa. Filed May 12, 1905. Serial No. 260,666.



Claim.—In a farm-gate, a gate hinged to a fixed post, a latch carried by the gate, a lever pivoted to the gate and to the latch, a cable secured to the lower end of said lever and to the top of the gate near its hinged end, and held out of a straight line by a support intermediate of its ends, a second lever pivoted transversely on the top of the gate, ropes connecting its ends with the latch-operating lever, ropes fixed to its ends and extended through direction-pulleys to a point along the roadway a considerable distance from the gate, a post having a striker to hold the gate in a closed position and posts having strikers to hold the gate in open positions.

808,870. SELF-LOADING SCRAPER. HERSCHEL F. PURDUM, Sac City, Iowa. Filed May 6, 1905. Serial No. 259,645.



Claim.—1. In a wheel-scraper, a carriage-frame having bridles in its parallel sides and a scraper having trunnions extended through said bridles to traverse them and means to adjust the scraper relative to the carriage-frame, for the purposes stated.

2. In a wheel-scraper, an oblong carriage-frame, stub-axles fixed to the parallel sides of the frame, a scraper adjustably connected with the sides of the frame, uprights pivotally connected with the stub-axles and a rotatable shaft mounted in the top portions of the uprights and means to move the uprights and rotatable shaft forward to elevate and dump the scraper.

3. In a wheel-scraper, an oblong carriage-frame, stub-axles connected to the parallel sides of the frame, uprights pivotally connected with the stub-axles and a rotatable shaft mounted in the top portions of the uprights, tapering enlargements on the end of the shaft, a scraper having handles fixed to its rear end, ropes fixed to the handles and to the enlargements on the end of the shaft.

4. In a wheel-scraper, an oblong carriage-frame, stub-axles connected to the parallel sides of the frame, uprights pivotally connected with the stub-axles and a rotatable shaft mounted in the top portions of the uprights, tapering enlargements spirally grooved, ropes fixed to the small end of the grooved enlargements and to the double elbow-shaped handles fixed to the rear of the scraper.

5. In a wheel-scraper, an oblong carriage-frame, stub-axles connected to the parallel sides of the frame, uprights pivotally connected with the stub-axles and a rotatable shaft mounted in the top portions of the uprights, traction-wheels on the stub-axles, a clutch

member on the end of one of the hubs a mating movable clutch member on the same axle and means to operate the movable clutch member.

6. In a wheel-scraper, an oblong carriage-frame, stub-axles connected to the parallel sides of the frame, uprights pivotally connected with the stub-axles and a rotatable shaft mounted in the top portions of the uprights, traction-wheels on the stub-axles, a clutch member on the end of one of the hubs, a mating movable clutch member on the same axle, a lever fulcrumed to the carriage-frame to engage the movable clutch, a leaf-spring fixed to the side of the carriage-frame to normally retain the clutches in engagement and a treadle fixed to the rear end of the frame and connected with the lever for separating the clutch members to operate the movable clutch member.

7. In a wheel-scraper, an oblong carriage-frame, stub-axles connected to the parallel sides of the frame, uprights pivotally connected with the stub-axles and a rotatable shaft mounted in the top portions of the uprights, traction-wheels on the stub-axles, a clutch member on the end of one of the hubs a mating movable clutch member on the same axle, a lever fulcrumed to the carriage-frame to engage the movable clutch, a leaf-spring fixed to the side of the carriage-frame to normally retain the clutches in engagement and a treadle fixed to the rear end of the frame and connected with the lever for separating the clutch members to operate the movable clutch member, a spring-actuated rock-shaft in bearings fixed to one of the uprights, an arm at its lower end to lock the movable clutch and an arm at its upper end to contact with the rotatable shaft in the top of the uprights to retain the rock-shaft stationary and the spring on the shaft inoperative.

8. In a wheel-scraper, an oblong carriage-frame, stub-axles connected to the parallel sides of the frame, uprights pivotally connected with the stub-axles and a rotatable shaft mounted in the top portions of the uprights, traction-wheels on the stub-axles, a clutch member on the end of one of the hubs, a mating movable clutch member on the same axle and means to operate the movable clutch member, a cross-bar fixed to uprights pivoted to the stub-axles, a bar fixed to the center of the cross-bar and a lever-bearer connected with the end of it, a lever pivoted to the lever-bearer and fulcrumed to the top of the upright at the rear and center of the carriage-frame and a scraper adjustably connected with the parallel sides of the carriage-frame.

9. In a wheel-scraper, an oblong carriage-frame, stub-axles connected to the parallel sides of the frame, uprights pivotally connected with the stub-axles and a rotatable shaft mounted in the top portions of the uprights, traction-wheels on the stub-axles, a clutch member on the end of one of the hubs a mating movable clutch member on the same axle and means to operate the movable clutch member, a cross-bar fixed to uprights pivoted to the stub-axles, a bar fixed to the center of the cross-bar and a lever-bearer connected with the end of it, a lever pivoted to the lever-bearer and fulcrumed to the top of the upright at the rear and center of the carriage-frame a scraper adjustably connected with the sides of the carriage-frame and a seat for an operator at the side of said lever at the rear end of the frame.

10. In a wheel-scraper, an oblong carriage-frame, a scraper adjustably connected with the sides of the frame stub-axles connected to the parallel sides of the frame, uprights pivotally connected with the stub-axles and a rotatable shaft mounted in the top portions of the uprights, traction-wheels on the stub-axles, a clutch member on the same axle and means to operate the movable clutch member on the same axle, a cross-bar fixed to uprights pivoted to the stub-axles, a bar fixed to the center of the cross-bar and a lever-bearer connected with the end of it, a lever pivoted to the top of the upright at the rear and center of the carriage-frame and a seat for an operator at the side of said lever and means for holding and lifting the double elbowed handles and scraper.

11. In a wheel-scraper, an oblong carriage-frame, a scraper adjustably connected with the carriage-frame, handles fixed to the rear end of the scraper stub-axles connected to the parallel sides of the frame, uprights pivotally connected with the stub-axles and a rotatable shaft mounted in the top portions of the uprights, traction-wheels on the stub-axles, a clutch member on the same axle and means to operate the movable clutch member, a cross-bar fixed to uprights pivoted to the stub-axles, a bar fixed to the center of the cross-bar and a lever-bearer connected with the end of it, a lever pivoted to the lever-bearer and fulcrumed to the top of the upright at the rear and center of the carriage-frame, a seat for an operator at the side of said lever and detents pivoted to the rear end of carriage-frame for holding and lifting the double elbowed handles and scraper.

12. In a wheel-scraper, an oblong carriage-frame, a scraper adjustably connected with the carriage-frame stub-axles fixed to the parallel sides of the frame, uprights pivotally connected with the stub-axles and a rotatable shaft mounted in the top portions of the uprights, traction-wheels on the stub-axles, a clutch member on the same axle and means to operate the movable clutch member, a cross-bar fixed to uprights pivoted to the stub-axles, a bar fixed to the center of the cross-bar and a lever-bearer and connected with the end of it, a lever pivoted to the lever-bearer and fulcrumed to the top of the upright at the rear and center of the carriage-frame and a seat for an operator at the side of said lever, detents forked at their outer ends and terminating with inclined extensions at their inner ends and means to lock the detents pivoted to the rear end of carriage-frame for holding and lifting the handles fixed to the scraper.

13. In a wheel-scraper, an oblong carriage-frame having bridles in its parallel sides, a scraper having fixed trunnions in said bridles stub-axles fixed to the parallel sides of the frame, uprights pivotally connected with the stub-axles and a rotatable shaft mounted in the top portions of the uprights, traction-wheels on the stub-axles, a clutch member on the same axle and means to operate the movable clutch member, a cross-bar fixed to uprights pivoted to the stub-axles, a bar fixed to the center of the cross-bar and a lever-bearer and connected with the end of it, a lever pivoted to the lever-bearer and fulcrumed to the top of the upright at the rear and center of the carriage-frame, a seat for an operator at the side of said lever, detents forked at their outer ends and terminating with inclined extensions at their inner ends and a lever pivoted to the upright at the rear of the carriage-frame and provided with a ring at the end of its short arm to admit the extensions of the detents, a rack fixed to the upright and a spring-actuated pawl connected with the lever to lock the detents pivoted to the rear end of carriage-frame for holding and lifting the double elbowed handles and scrape.

14. In a wheel-scraper, an oblong carriage-frame having bridles in its parallel sides to admit trunnions, a scraper having fixed trunnions in said bridles stub-axles fixed to the parallel sides of the frame, uprights pivotally connected with the stub-axles and a rotatable shaft mounted in the top portions of the uprights, traction-wheels on the stub-axles, a clutch member on the same axle and means to operate the movable clutch member, a cross-bar fixed to the uprights pivoted to the stub-axles, a bar fixed to the center of the cross-bar and a lever-bearer and connected with the end of it, a lever pivoted to the lever-bearer and fulcrumed to the top of the upright at the rear and center of the carriage-frame, a seat for an operator at the side of said lever, detents forked at their outer ends and terminating with inclined extensions at their inner ends and a lever pivoted to the upright at the rear of the carriage-frame and provided with a ring at the end of its short arm to admit the extensions of the detents, a rack fixed to the upright and a spring-actuated pawl connected with the lever to lock the detents pivoted to the rear end of carriage-frame for holding and lifting the double elbowed handles and scrape.

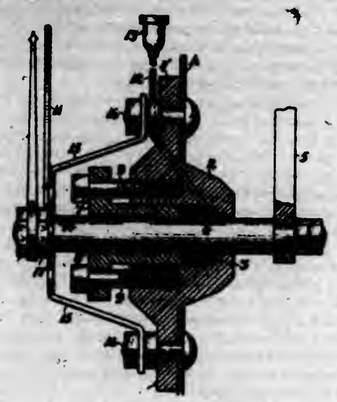
15. In a wheel-scraper, an oblong carriage-frame having bridles in its parallel sides to admit trunnions, stub-axles fixed to the parallel sides of the frame, uprights pivotally connected with the stub-axles and a rotatable shaft mounted in the top portions of the uprights, tapering enlargements on the end of the shaft, a scraper having handles fixed to its rear end and trunnions at its sides to traverse the bridles in the sides of the frame, ropes fixed to the handles and to the enlargements on the end of the shaft and springs fixed to the ends of the cross-bar connected with the uprights of the stub-axle and to the sides of the carriage-frame.

808,871. TANK-INDICATOR. ELMER RAHN and IRA C. MAY, Sacramento, Cal., assignors of one-third to Howell S. Corbin, Sacramento, Cal. Filed June 19, 1905. Serial No. 266,827.

Claim.—1. An oil-tank indicator comprising a casting having a central portion fitting an opening in the tank and bolts by which the perimeter of the casting is secured to the tank, said central portion of the casting having a chamber with packing and a gland operable in the chamber, a shaft passing through the chamber of the casting and the gland said gland being counterbored from the outer end to a point proximate to the inner end whereby a limited surface of contact is provided between the gland and shaft, a yoke having a central opening for the shaft said yoke having its ends bent inward and fitted to the same bolts which secure the casting to the tank, nuts engaging the bolts, and a float and indicator means at opposite ends of the shaft.

2. The combination with a tank having an opening, of a casting having a central portion fitting said opening, a shaft passing through the casting and a gland and packing in the casting and through

which said shaft also passes, a float carried by one end of the shaft, indicator means at the opposite end of said shaft, a pipe passing through the casing to the packing thereof and adapted to deliver a thin oil under pressure to said packing, and means for resisting end thrust of the shaft said means including a shoulder on the shaft and a yoke against which the shoulder abuts said yoke having inwardly-bent ends, bolts passing through the ends of the yoke and also the edge portion of the casing whereby single bolts secure both parts, and nuts engaging the bolts.



808,872. MAIL-BOX. EDWIN M. RAYMOND and WILLIAM S. STOUGHTON, Grand Rapids, Mich. Filed Mar. 14, 1905. Serial No. 249,989.

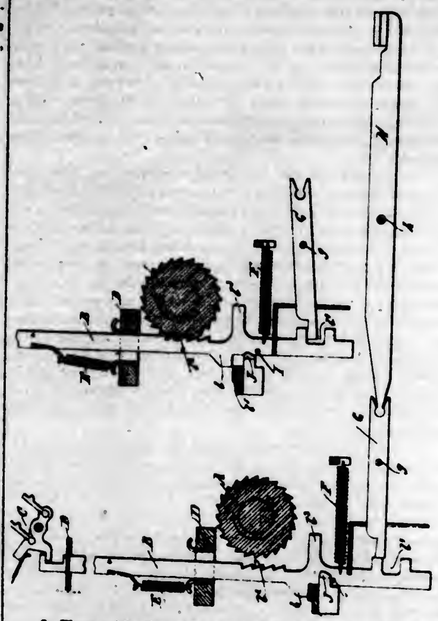
Claim.—1. A mail-box consisting of a case closed at the top and sides and open at the bottom, retaining-springs within the case to hold mail-matter inserted therein, and a pivotal support for the case located above the center of gravity of the case, upon which support the case is freely rotative.

2. A mail-box comprising a case having the form of a truncated pyramid and open at the bottom, a pivotal support for the case located above the center of gravity of the case upon which support the case is freely rotative, retaining-springs mounted on the top of the case, and retaining-springs in the lower part of the case.

3. A mail-box consisting of a truncated conical case open at the bottom, a pivot-support for the case located above the center of gravity of the case, a brace extending across the lower part of the case, diverging springs attached to the brace and extending upward within the case; and, opposing springs attached to the sides of the case and extending toward the first-named springs.

808,873. LINOTYPE-MACHINE. JOHN R. ROGERS, Brooklyn, N. Y., assignor to Rogers-Maser Linotype Company, a Corporation of New York. Filed Sept. 5, 1903. Serial No. 171,859.

Claim.—1. In a keyboard mechanism, the combination of a continuously-rotating toothed driving-roll, and a driven bar toothed to engage the roll and receive longitudinal motion therefrom and also toothed to engage the roll and effect the disengagement of the first-named tooth.



2. The combination of a continuously-rotating toothed driving-roll and a bar mounted to move longitudinally and laterally, said bar toothed to engage the roll and to cause the longitudinal movement, and also toothed to engage the roll and to cause the lateral movement.

3. The combination of a continuously-rotating toothed driving-roll, a bar mounted to move longitudinally and laterally and provided with teeth to engage the roll on different sides of its center, spring connections tending to draw the bar endwise and toward the roll, a finger-key mechanism acting to hold the bar normally out of engagement with the roll, and means for holding the bar out of engagement during its longitudinal retreat.

4. In a keyboard mechanism, the combination of the toothed roll, A, a bar, B, provided with actuating-teeth, b^3, and with a disengaging tooth, b^2, as described, means for throwing the bar into engagement, means for retreating the bar endwise when disengaged, means to hold the bar normally out of engagement, and means to hold it out of engagement while retreating endwise.

5. In combination, the toothed roll, A, the bar, B, having teeth, b^3, and tooth, b^2, spring connections tending to move the bar toward the roll, a spring connection tending to return the bar endwise when disengaged from the roll, means for holding the bar normally out of engagement with the roll, and means to hold it out of engagement while at rest.

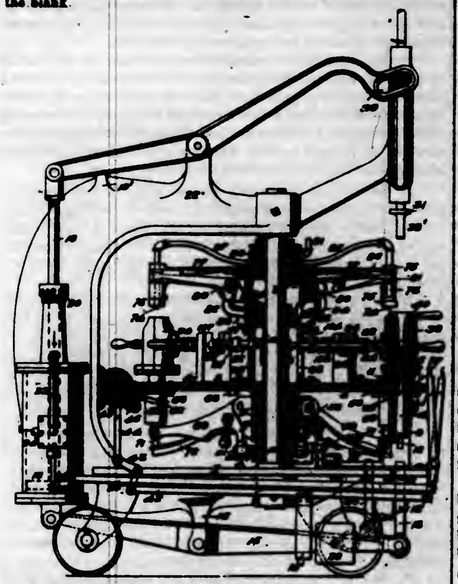
6. In a keyboard mechanism, the combination of a toothed roll, a bar moved thereby, and a key to hold the bar normally out of engagement, the bar adapted to restore the key to its normal position.

7. In a keyboard mechanism, the combination of a reciprocating bar, power-driven means for moving the same endwise, a spring to return the bar, and movable means adapted to hold the bar normally out of engagement and to be returned by the bar to its original position.

808,874. MACHINE FOR MAKING HOLLOW GLASS ARTICLES. HARRY SIMMS, Wilmington, Del. Filed Aug. 14, 1903. Serial No. 169,672.

Claim.—1. In a machine for making hollow glass articles including a mold, a shell-former having its inner walls flaring at each end, its outer end having a shoulder overhanging and closing the open bottom of the mold for the purpose stated.

2. In a machine of the character specified, and in combination with a mold, a shell-former having its inner walls flaring at each end, its outer end having a shoulder overhanging and closing the open bottom of the mold, and a plunger adapted to operate within and to close the upper flaring end of the shell-former in forming the body of the blank.



3. In a machine of the character specified, and in combination with a mold, a shell-former having its inner walls flaring at each end, its outer end having a shoulder overhanging and closing the open bottom of the mold, and a plunger adapted to operate within the flaring end of the shell-former and having a shoulder overhanging and closing the open flaring end of the shell-former.

4. In a machine of the character specified, and in combination with the mold, a shell-former or tube open at both ends, its inner end freely fitted upon the inner walls at the neck of the mold, its outer end flaring and having a shoulder closing the open bottom end of the mold.

5. In a machine of the character specified, and in combination with a mold open at both ends, a shell-former open at both ends and insertible within the open bottom of the mold, an upper plunger of less length than the shell-former adapted to operate in it in pressing the body of the blank, means automatically to insert and withdraw said plunger, an under plunger adapted to operate below the shell in forming the neck and blow-hole of the blank, and means automatically to insert said plunger into the mold.

6. In a machine of the character specified, and in combination with a mold open at both ends, a removable shell-former or tube open at both ends and adapted to fit upon the neck-walls of the mold, the outer end of the shell-former flaring and having a shoulder closing the open bottom of the mold, an upper plunger adapted to operate within the shell-former and having a shoulder abutting the shoulder of the shell-former to confine the latter and limit the insertion of the plunger, a seat stand or support adapted to close the neck end of the mold, a plunger adapted to operate within the neck end of the mold, means automatically to insert the upper plunger into and withdraw it from the shell-former, means automatically to raise and lower the seat-stand in its relation to the neck end of the mold and means automatically to insert the neck-forming plunger into the mold.

7. In a machine of the character specified, and in combination with a mold, a sleeve having a seat-stand adapted to close the neck-forming end of the mold, a lower plunger adapted to operate within the open neck of the mold, means automatically to raise and lower the seat-stand, means automatically to insert the plunger into the mold, means on the seat-forming stand and means provided on the plunger whereby the latter is withdrawn from the mold and means provided on the plunger and on the sleeve to limit the descent of the plunger from the mold.

8. In a machine of the character specified, and in combination with a mold open at both ends, a removable shell-former or tube open at both ends and adapted to fit upon the neck-walls of the mold-chamber, an upper plunger adapted to operate on the glass within the shell-former, a lever suspending and operating said plunger, a vertically-movable power-cylinder and a piston therein connected with said lever, and a power-supplying pipe connected to said cylinder, an under plunger adapted to operate within the open neck of the mold, a lifting-stem for said under plunger, a lever mounted beneath the base connected to said lifting-stem and to the lower end of power-cylinder, a hand-lever mounted on the base and a rod connecting said hand-lever with the valve connections of the power-cylinder

9. In a machine for making necked glass articles, an open-ended mold the matrix of which conforms to the shape of the body and neck of the completed articles a shell or tube removably insertible in the mold and adapted with the neck-forming portion of the mold-matrix to form the blank, a plunger removably insertible in the mold to form the blow-hole, a bottom-forming plunger insertible in the mold upon the withdrawal of the tube to form the bottom of the article, and blowing means for completing the article

10. In a machine for making necked glass articles, an invertible mold, blank-forming means comprised of a shell or tube insertible through one end of the mold and a blow-hole-forming plunger insertible through the opposite end of the mold, and blowing means operating upon the inversion of the mold to complete the article.

11. In a machine for making necked glass articles, an invertible open-ended mold, a shell-former in the mold and a plunger in the shell-former and of less length both at one end of the mold in one position of the latter, a lower blow-hole-forming plunger operating in the neck end of the mold below the shell-former to form the blank and blowing means operating to complete the article upon the removal of said shell and upper plunger and the inversion of the mold.

12. In a machine for making necked glass articles, an invertible open-ended mold, devices insertible through opposite ends of the mold in one position of the latter to form a blow-hole-containing blank, and a blowing device and a bottom-forming device insertible respectively through opposite ends of the mold after its inversion and the removal of the blank-forming devices.

13. In a machine for making necked glass articles, an invertible open-ended mold, a blank-forming tube and a blow-hole-forming plunger insertible respectively through opposite ends of the mold in one position of the latter, and means for finishing the article upon the inversion of the mold and the removal of the tube and plunger.

14. In a machine for making necked glass articles, an invertible open-ended mold, a blank-forming shell or tube and a blow-hole-forming plunger insertible respectively through opposite ends of the mold in one position of the latter, and a blowing device and a bottom-forming plunger insertible respectively through opposite ends of the mold after its inversion and the removal of the shell or tube and plunger.

15. In a machine for making necked glass articles, an open-ended mold, devices removably insertible in the mold for forming a blow-hole-containing blank, a blow-tube adapted to enter the blow-hole of the blank, and a bottom-forming plunger movable in the mold as the blowing progresses, said blow-tube and plunger being insertible upon the withdrawal of the blank-forming devices.

16. In a machine for making necked glass articles, an open-ended mold, an apertured support for the mold, a blow-hole-forming plunger movable through said support-aperture to enter one end of the mold, a shell or tube insertible through the opposite end of the mold, and an upper plunger insertible in the tube, said parts coacting to form a blow-hole-containing blank.

17. In a machine for making necked glass articles, an invertible open-ended mold, devices removably insertible in the mold in one position of the latter for forming a blow-hole-containing blank, means for inverting the blank-containing mold, an apertured stand for supporting the inverted mold, a bottom-forming plunger movable in the stand-aperture to enter the mold, and a blow-tube insertible through the opposite end of the mold.

18. In a machine for making necked glass articles, an open-ended mold, an apertured support for the mold, a blow-hole-forming plunger movable through said support-aperture to enter one end of the mold, a blank-forming shell or tube insertible through the opposite end of the mold, a second apertured stand, means actuated by hand for inverting and carrying the blank-containing mold after the removal of the tube and plunger to the second stand, a bottom-forming plunger movable in the second stand-aperture to enter the mold, and a blow-tube insertible through the opposite end of the mold.

19. In a machine for making necked glass articles, the combina-

tion of a mold and means for forming a blow-hole-containing blank, including a vertically-movable seat-stand and a vertically-movable plunger, a blow-tube, and means for moving the blow-tube nozzle to and from the blank, including a bell-crank lever and a cam for actuating the lever and a table rotatively carrying the mold and the blow-tube.

20. In a machine for making hollow glass articles, the combination of rotatable means including a mold, for forming a blow-hole-containing blank, a blow-tube, and means for moving the blow-tube to and from the mold comprised of a fixed cam centrally located in its relation to said rotating means, a bell-crank lever between the cam and blow-tube for raising the latter from the mold and rotating with said means and a spring for holding the blow-tube firmly within the neck-forming end of the mold.

21. In a machine for making glass articles, the combination of a mold, a pair of vertically-movable seat-stands side by side on one of which the mold is seated in an inverted position during the forming of the blank for the article, the other seat-stand supporting the mold during the operation by which the article is finished by blowing, and means by which the mold is changed from one seat-stand to the other.

22. In a machine for making glass articles, the combination of a mold, a seat-stand therefor, means coacting with both ends of the mold and the said seat-stand for pressing the blank therein, a second mold seat-stand, means by which the mold is changed by inversion from one support to the other, and blowing means for completing the article on the second seat-stand.

23. In a machine for making glass articles, the combination of a mold, a pair of vertically-movable seat-stands, means for pressing in the mold on one of said seat-stands a blow-hole-containing blank, means for imparting to the mold a swinging movement to invert it from one seat-stand to the other and means for blowing the article in the inverted mold.

24. In a machine of the character described, the combination of a mold, a hollow shaft fixed to the side of and carrying said mold, a fixed bearing-support for the inner end of the hollow shaft, a pinion fixed on the hollow shaft between its fixed end bearing and the mold, a fixed rack for the pinion supporting the hollow shaft, the latter having a swinging movement in its fixed end bearing, tops at each end of the rack limiting the swinging movement of the shaft, and a pair of seat-stands coöperating with the mold in the separate operations of press-forming and blowing the article.

25. In a machine of the character described the combination of a mold of two hinged sections, a hollow shaft fixed on the side of one of said mold-sections, a fixed bearing-support for said shaft, means for rotating said shaft, a lock for said mold-sections, and means operating longitudinally within said shaft to effect the release of the lock.

26. In a machine for making glass articles, the combination of a mold, a vertically-movable support for said mold, means for forming in the mold a blow-hole-containing blank, means for inverting the blank-containing mold, a vertically-movable support for the inverted mold, and blowing means including a movable nozzle for completing the article in the inverted mold.

27. In a machine for making glass articles including a mold, the combination of a pair of seat supports or stands for the mold, means for pressing in the mold on one of said seat-supports, a blow-hole-containing blank, blowing means for completing the article in the mold on the second seat-stand, and means for firmly supporting the molds on the separate seat-stands during the separate operations.

28. In a machine for making glass articles, the combination of an arm, means actuated by hand swinging said arm in a circular path, a mold formed of two hinged sections and carried by said arm, a pivoted catch for locking the closed mold, a spring-retracted rod connected with said catch, and a fixed cam for moving the rod and catch against the tension of the spring to release the mold.

29. In a machine for making glass articles, the combination of a rotatable support, a tubular arm or shaft extending radially therefrom, a two-part mold carried by said arm, a fixed cam, a rod slidable in the tubular arm and engaged by the cam, a pivoted catch for locking the mold parts, and a sleeve connected with the rod and having a cam-slot engaging with said catch.

30. In a machine for making glass articles, the combination of an open-ended mold, means for forming therein a blow-hole-containing blank, means for inverting the blank-containing mold, a vertically-movable support for the inverted mold, and a bottom-forming plunger movably mounted in said support and adapted to be removably inserted through the lower end of the inverted mold to form the bottom of the finished article.

31. In a machine for making glass articles, the combination of an open-ended mold, means for inverting the blank-containing mold during movement of the latter, a support for the inverted mold, means including a fixed cam and a bell-crank lever for raising and lowering said support, a plunger-former for forming the bottom of the finished article movably mounted in said support, and means including a fixed cam and lever connections for removably inserting the plunger into the lower end of the inverted mold.

32. In a machine for making glass articles, the combination of an open-ended mold, means coacting with said mold for forming therein a blow-hole-containing blank, means for inverting the blank-containing mold, a support for the inverted mold, a blow-tube nozzle vertically movable into the upper end of the inverted mold, and a bottom-forming plunger movable into the lower end of the inverted mold and receding therefrom in the blowing operation.

33. In a machine for making glass articles, the combination of a mold, a vertically-movable support for the mold, said support and mold adapted to swing in a circular path, a cam in the path of said support operating to raise the latter in position to support the mold, and means for shifting the cam to release the support and permit its retraction.

34. In a machine for making glass articles, the combination of an open-ended mold, a vertically-movable stand for the mold, said stand and mold adapted to move in a circular path, a pivoted cam in the path of the stand arranged to be shifted a predetermined distance by the stand and thereafter to elevate the latter into position to support the mold, a stop for limiting the movement of the cam, and means for retracting the cam to permit retraction of the stand.

35. In a machine for making glass articles, the combination of an open-ended mold, a vertically-movable stand for the mold, said stand and mold adapted to move in a circular path, a pivoted cam in the path of the stand arranged to be shifted a predetermined distance by the moving stand and thereafter to elevate the latter into position to support the mold, a stop for limiting the movement of the cam, and a vertically-movable latch arranged to engage the aforesaid cam and retract it to permit the descent of the stand.

36. In a machine for making glass articles, the combination of an open-ended mold, a blank-forming shell or tube insertible in the upper end of the mold, a vertically-movable stand for the mold, a blow-hole-forming plunger movable in an aperture of the stand, a lever 15 for elevating said plunger into the lower end of the mold, a pivoted cam for elevating the stand into position to support the mold, and a latch or trip carried by said lever for engaging the cam to retract it and permit the descent of the stand.

37. In a machine for making glass articles, the combination of an open-ended mold, a blank-forming tube or shell insertible in the upper end of the mold, a vertically-movable stand for the mold, a blow-hole-forming plunger movable in an aperture in the stand to enter the lower end of the mold, a pivoted cam adapted in one position to engage and elevate the stand into position to support the mold, a pivoted lever 15, a rod between the lever and plunger to effect the elevation of the latter, and a spring-controlled latch carried by the lever and adapted in the movement of the latter to engage the cam to retract it and release the stand.

38. In a machine for making glass articles, the combination of an open-ended mold, a blank-forming tube or shell insertible in the upper end of the mold, a vertically-movable stand for the mold, a blow-hole-forming plunger movable in an aperture in the mold to enter the lower end of the latter, means for elevating the stand into position to support the mold, a lever having a rod for engaging and elevating said plunger, and also carrying a trip or latch to engage said means and release the stand, and means for moving said lever.

39. In a machine for making glass articles, the combination of an open-ended mold, a blank-forming tube or shell insertible in the upper end of the mold, an upper plunger insertible through the tube, an upper lever connected with said plunger, a lower lever, a fluid-pressure cylinder on the lower lever, a piston in the cylinder the rod of which is connected with the upper lever, a vertically-movable stand for the mold, a pivoted cam adapted to elevate the stand into position to support the mold, a blow-hole-forming plunger movable in an aperture in the stand to enter the lower end of the mold, a rod carried by the lower lever arranged to engage the last-named plunger and force it into the mold, and a trip arm or latch carried by the lower lever arranged to engage the cam and move it to release said stand.

40. In a machine for making glass articles, a fixed shaft carrying a plurality of fixed cams, a table rotatable about said shaft, a two-part invertible mold, rotatable with the table, locking and releasing means for the mold operated by one of said cams, supports for the mold in its normal and inverted positions, means for moving one of said supports operated by another of said cams, a bottom-forming plunger, means for operating said plunger controlled by another of said cams, and blowing means including a nozzle operated to enter the mold by another of said cams.

41. In a machine of the character described, a circular table rotatable about a shaft, a plurality of mold-supporting seat-stands arranged in pairs, a mold for each pair of stands, means for imparting to the mold a movement to invert it from one seat-stand to the other, a blow device for each mold arranged in vertical alinement with one of the seat-stands of each pair, a valve-controlled air-supply common to each blow device, the seat-stands, the molds, the blow devices and the valve-controlled air-supply maintaining their coöperative relation during the rotation of the table.

42. In a machine for making glass articles and in combination, a circular table having peripheral cogs, rotatable about a shaft and carrying a plurality of mold-supporting stands, a worm mounted tangential to the table and engaging said cogs, a clutch member fixed to said worm, a clutch member operated from a source of power, hand-controlled means for effecting the intermittent rotation of the table, a plurality of molds, plungers adapted to operate within the opposite ends of the mold, and hand-controlled means for actuating the plungers.

43. In a machine for making glass articles and in combination, a rotatable table, a plurality of molds carried thereby a blow-nozzle for each mold, means for automatically inserting it therein, an air-controlling valve arranged to communicate with the blow-nozzles successively, means for effecting the intermittent rotation of the molds and the blow-nozzles at the same speed, and means for maintaining the air-pressure in the mold during such rotation.

44. In a machine for making glass articles, a circular table rotatable about a shaft and having a peripheral series of teeth, mold-supporting stands carried by said table, a series of studs or projections on said table, a constantly-driven shaft carrying a clutch member, a worm engaging the said teeth and connected with a companion clutch member, and means controlled by hand for effecting the engagement and release of said clutch members, and for interposing a stop in the path of said studs successively.

45. In a machine for making glass articles, and in combination with a two-part or divided mold, a hollow shaft on which it is mounted having slots 99, a rod within the hollow shaft having pins passing through said slots, a slotted collar 103 fixed on said shaft, a latch pivoted to one part of the mold, engaging said slotted collar, and adapted to engage a lug 106 on the other mold part, a central shaft, and a cam 103, fixed thereon and adapted to force the rod outward to effect the engagement of the latch with the mold-lug, and a spring on the hollow shaft to press it inward to release the latch from the lug.

46. In a machine for making glass articles and in combination, a plurality of molds, a blow-nozzle for each mold, means automatically for effecting the insertion of the nozzle into the mold, a flexible tube connecting each nozzle with the air-pressure supply, means for controlling the air-pressure in the blowing operation consisting of a rotating table carrying the molds and the blowing devices, a valve member carried by the table and having a plurality of ports one connecting each air-tube, a fixed valve member supplementing the rotating valve member and having a single port registering with the ports of the rotating member, and causing the air to remain under pressure in the mold during each intermittent movement of the table.

47. In a machine for making glass articles, and in combination with a mold open at both ends, a seat-stand for the open bottom of the mold, a bottom-forming plunger centrally within the seat-stand, a blow device in central alinement above the neck-forming end of the mold, means automatically to raise and lower the seat-stand in its relation to the mold, means automatically to raise the bottom-forming plunger within and to withdraw it from the mold, and means automatically to insert the blow device within the neck-forming end of the mold and to withdraw it therefrom in the operation of blowing the article.

48. In a machine of the character described, a bed-plate, a vertical shaft central thereon, a table rotatively mounted on the shaft, a plurality of mold-seats arranged in pairs side by side on the table around and in equal distance from the shaft, a mold for each pair of seat-stands mounted for inversion from one seat-stand to the other of the pair in the operations of pressing and blowing the article, means arranged beneath and above the bed-plate and operating in and upon one of each pair of the seat-stands for forming the neck and body of the article in one position of the mold, and means operating the devices for forming and blowing the article in the reversed position of the mold upon the adjacent seat-stand and means for intermittently rotating the table.

49. In a machine of the character described, a bed-plate, a vertical shaft fixed thereon, a table rotatively mounted on the shaft, a plurality of mold seat-stands arranged in pairs side by side around and equidistant from the shaft, a plurality of molds one for each pair of seat-stands, means for inverting each mold from one seat-stand to the other of the pair, a plurality of blow devices and means for operating the one for each mold arranged above the molds, a valve central with the shaft having communication with each blow device and with a compressed-air supply, means for intermittently rotating the table and means for maintaining the mold on the blowing seat-stand a longer time than on the pressing seat-stand.

50. In a machine of the character described, a bed-plate, a vertical shaft thereon, a table rotatively mounted on the shaft, a plurality of mold seat-stands arranged in pairs side by side on the table around and equidistant from the shaft, a plurality of molds one for each pair of seat-stands, means below and above the bed-plate and above the rotating table arranged in vertical alinement for operation with the mold in forming the blow-hole and body of the blank, means below and above the table in alinement for operation in blowing the article, means for inverting and transferring the mold out of alinement with one seat-stand into alinement with the other of the pair of seat-stands, and means for elevating the seat-stands to seat the mold in its transfer from one stand to the other and in alinement in each position with the pressing and the blowing devices.

51. In a machine of the character described, a bed-plate, a vertical shaft thereon, a table rotatively mounted on the shaft, a plurality of seat-stands arranged in pairs side by side on the table around and equidistant from the shaft, a plurality of molds one for each pair of seat-stands in their separate use for forming and blowing the article, upper and neck-forming plungers for the pressing seat-stands, a bottom-forming plunger and a blow-nozzle for each of the other seat-stands of the pair, these parts mounted to rotate together with the table and operated in the order described, a lever device for lifting each of the neck-forming plungers and levers for lifting the bottom-forming plungers of each of the other seat-stands of the pair in the blowing operation, means for operating the levers and means for rotating the table.

52. In a machine of the character described, a bed-plate, a vertical shaft thereon, a table rotatively mounted on the shaft, pairs of seat-stands 6, and 66 carried by the table around and equidistant from the shaft, a plurality of molds one for each pair of seat-stands, a cam 12 fixed on the bed-plate for lifting the seat-stand 6, a blow-hole-forming plunger 11 within the seat-stand, a lever 15, mounted on the bed-plate for lifting said plunger into the mold, a body-forming shell in the mold, an upper plunger for operating within the shell, a lever 21 for operating said plunger, a vertically-slidable power-cylinder pivotally connected to the lower lever, a piston-rod actuated by the power-cylinder and connected to the upper lever 21 a valve for controlling the air-supply to the cylinder, and a hand-actuated lever for controlling the valve to control the operation of the plungers.

53. In a machine of the character described, a bed-plate, a vertical shaft thereon, a table vertically mounted on the shaft, pairs of seat-stands 6 and 66 carried by the table around and equidistant from the shaft, a plurality of molds, one for each pair of seat-stands, a lever 69 mounted to rotate with the table for lifting the seat-stand 66, a bottom-forming plunger 71 within the seat-stand, a lever 72 for lifting said plunger, a cam 109 fixed on the shaft for operating the stand-lifting lever, and a cam 115 on the bed-plate for operating the plunger-lifting lever 72, an overhead blow-nozzle carried by the table one for each mold, a lever 79 for vertically operating the blow-nozzle, and a cam 84 on the fixed shaft for actuating the lever 79, a valve formed of a fixed and a rotating part, an air-supply tube connecting to the fixed valve part which latter is concentric with the shaft, and a flexible tube connecting the rotating valve part with the blow-nozzle for operation as stated.

54. In a machine of the character described, a bed-plate, a vertical shaft thereon, a table rotatively mounted on the shaft, a plurality of seat-stands carried by the table in pairs side by side and equidistant from the shaft, a plurality of molds one for each pair of stands, suitable means coacting with the stands and molds for pressing and for blowing the article, means for supporting and inverting each mold consisting of a sleeve 92, supported in suitable bearings on the table, a segmental rack 96 on the table, a half-gear fixed on the sleeve resting on and engaging the rack, and stops on said rack to limit the travel of the pinion to a semirevolution, whereby the mold is inverted from the press-forming stand to the blow-nozzle stand.

55. In a machine of the character described, a bed-plate, a vertical shaft thereon, a table rotatively mounted on the shaft, a plural-

ity of seat-stands carried by the table in pairs side by side and equidistant from the shaft, a plurality of hinged molds one for each pair of stands, a sleeve 32 fixed to and supporting the mold in bearings on the table, a segmental rack on the table, a half-gear fixed on the sleeve resting on and engaging the rack and limited in its movement to a semirevolution on the rack to invert the mold from one seat-stand to the other, a rod longitudinally movable within the sleeve, stops on the sleeve to limit each movement of the rod, a coil-spring on the sleeve constantly forcing the rod to the limit of its inward movement, a cam on the fixed shaft for moving the rod outward, and means actuated by said rod for locking and unlocking the hinged mold parts during the revolution of the table.

56. In a machine of the character described, and in combination a rotating table, a plurality of seat-stands carried by the table in pairs, side by side, a plurality of hinged molds one for each pair of seat-stands, means for inverting a mold from one seat-stand to the adjacent seat-stand, means for press-forming the blank, in the mold on one stand, means for blowing the bottle in the same mold on the adjacent stand, means for rotating the table intermittently by fifths of the circle, means automatically to open the mold for the removal of the blown bottle consisting of a latch for locking the hinged mold parts together, a sleeve on the end of which the mold is fixed, a rod within the sleeve, a collar 101 having an oblique slot 102 engaging one end of the latch and fixed to the rod by a pin passing through slots in the sleeve, a coiled spring on the sleeve connected to and constantly tending to force the oblique collar to hold the latch firmly locked, and a cam engaging the inner end of the rod and adapted to force its obliquely-slotted collar to unlock the latch to allow the mold to be opened.

57. In a machine of the character described, and in combination, a rotating table, a plurality of seat-stands carried thereby in pairs side by side, a plurality of invertible molds one for each pair of seat-stands, means for limiting the inversion of the mold to half a circle corresponding to the space between the seat-stands so that each mold is rotated from one seat-stand to the other of the pair, lower and upper plungers and means for actuating each in opposite directions to press the blow-hole and the body of the blank within the mold on one seat-stand, a bottom-forming plunger and a blow-nozzle, and means for actuating each in opposite directions to form the bottom and blow the bottle in the inverted mold on the other seat-stand of the pair.

58. In a machine of the character described, a rotating table, a plurality of seat-stands carried thereby grouped in pairs side by side, a vertical neck-forming plunger for each pair, an upper plunger in alinement with the center of one of the mold-stands, and a vertically-movable overhead blow-nozzle in alinement with the center of the other mold-stand, a night for each pair of seat-stands and means for inverting the mold from one seat-stand to the other, means for inserting the plungers and the blow-nozzle into the mold when seated and means for withdrawing the plungers and the blow-nozzle from the mold to allow of its inversion from one stand to the other.

59. In a machine of the character described, a mold, a pair of pressing-plungers therefor one operating in each end of the mold, a lever 15 for actuating the lower plunger, a lever 21 for actuating the upper plunger, a motor for actuating the levers consisting of a power-cylinder pivotally connected to and supported upon the end of the lower lever, a piston in the cylinder, the upper lever connected to the rod of the piston, a valve on the cylinder controlling the entrance of the motive fluid therein to cause the descent of the cylinder and the ascent of the piston-rod, a lever for controlling the valve for causing both plungers to be forced into the mold successively and to be withdrawn from the mold successively, a stop to limit the ascent of the cylinder and a stop to limit the descent of the piston.

60. In a machine of the character described, a mold, a pair of plungers therefor one operating in each end of the mold, a lever for actuating the lower plunger in forming the neck and the blow-hole of the article, a lever for actuating the upper plunger to form the body of the article, a compressed-air motor for actuating the levers consisting of a vertically-movable cylinder connected with the lower lever, a piston and its rod connected with the upper lever, a valve in said cylinder, a pipe connecting the valve with the fluid-supply and means for controlling the valve for holding the plungers under air-pressure in operative position to the mold.

61. In a machine of the character described, a mold, a plunger for forming the bottom of the article, a blow-nozzle, a guide-arm therefor, a lever pivotally mounted on the guide-arm and engaging the stem of the blow-nozzle, a cam adapted to lift the lever to hold the blow-nozzle in operative position, means for firmly holding the blow-nozzle in operative position, a lever engaging the bottom-forming plunger, a cam adapted to actuate the lever to cause it to descend in the mold while supporting the bottle as it is being blown, and means connecting the blow-nozzle with the compressed-air supply.

62. In a machine of the character described, a bed-plate, a vertical shaft thereon, a table rotatively mounted on the shaft, a plurality of seat-stands carried by the table in pairs, side by side and equidistant from the shaft, a plurality of molds one for each pair of stands, means for inverting a mold from one seat-stand to the other seat-stand of the pair, pressing-plungers vertically operative in each seat-stand, an upper pressing-plunger and an overhead blow-nozzle arranged vertically in alinement with the stand-plungers for pressing the blank in the mold on one stand and for blowing the finished article in the same mold on the adjacent stand, means for supplying the blow-nozzle with compressed air, means for rotating the table intermittently in fifths of the circle, and means controlling the air-supply to the blow-nozzles whereby to cause the air to remain under pressure in the blown bottle during one-fifth of the rotation of the table.

63. In a machine of the character described, a bed-plate, a vertical shaft thereon, a table vertically mounted on the shaft, a plurality of seat-stands carried by the table in pairs side by side and equidistant from the shaft, a plurality of molds one for each pair of stands, means for inverting a mold from one seat-stand to the adjacent seat-stand, means for press-forming the blank in the mold on one stand, means for blowing the bottle in the same mold on the adjacent stand, means for rotating the table intermittently by fifths of the circle, means for controlling the air-supply to each mold during one-fifth of the rotation of the table, and means automatically to open the mold for the removal of the blown bottle.

64. In a machine of the character described, a circular table rotatable about a fixed vertical shaft, an arm or tubular shaft supported on said table, a mold of hinged sections one of which is fixed to said tubular shaft, a latch pivoted on the shaft-connected mold-section, adapted to engage the other mold-section, a spring-retracted rod within the tubular shaft, a collar on the rod having an oblique slot engaging one end of the latch, and means whereby the rod is moved longitudinally and caused to maintain the engagement of the latch with the mold-section and a spring operatively connected to retract the rod to release the engagement of the latch with the mold.

65. In a machine for making glass articles including a rotatable table, a rotatable shaft radial thereon, a mold fixed on one end thereof, the other end of said shaft supported in a bearing, a segmental pinion on said shaft between the mold and said end bearing and a segmental rack for the pinion provided with stops for limiting its rotation in its travel on the rack to invert the mold, the bearing for the shaft and the rack-support for the pinion being fixed upon the table and the mold and its shaft movable in the arc of a circle on its inner end independent of the movement of the table and only to an extent required to invert the mold.

808,875. **TYPE-WRITING MACHINE.** CHARLES H. SHEPARD, New York, N. Y., assignor to Wyckoff, Seamans & Benedict, Hem. N. Y., a Corporation of New York. Filed Oct. 1, 1903. Serial No. 176,270.

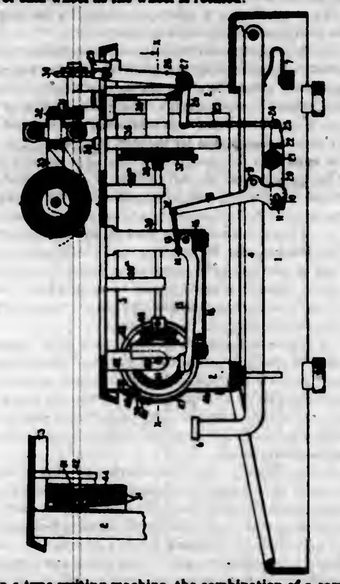
Claim.—1. In a type-writing machine, the combination of a carriage, a wheel having indicating-marks thereon and which is automatically rotated during the travel of the carriage, a coöperating shield, and means for moving said shield during the travel of the carriage back and forth.

2. In a type-writing machine, the combination of a carriage, a wheel connected to be rotated by the travel of the carriage, indicating-marks arranged in different planes on said wheel, a shield that is adapted to expose said marks one at a time, and means for moving said shield during the travel of the carriage back and forth.

3. In a type-writing machine, the combination of a carriage, a wheel connected to be rotated by the travel of the carriage back and forth, spirally-arranged indicating-marks on said wheel, a shield that is adapted to expose said marks one at a time, and means for automatically moving said shield as the wheel is rotated in opposite directions by the back-and-forth travel of the carriage.

4. In a type-writing machine, the combination of a carriage, a wheel connected to be rotated in opposite directions by the travel of the carriage back and forth and which is fixed against axial movement, a series of indicating-marks arranged around said wheel and in different transverse planes thereon, a shield that is adapted to expose said marks one at a time, and means for moving said shield back and forth in the general direction of the axis of said wheel.

5. In a type-writing machine, the combination of a carriage, a wheel connected to be rotated by the travel of the carriage back and forth and which is fixed against axial movement, a series of indicating-marks spirally arranged around said wheel, a shield that is adapted to expose said marks one at a time, and means for automatically moving said shield back and forth in the general direction of the axis of said wheel as the wheel is rotated.



6. In a type-writing machine, the combination of a carriage, a wheel or drum connected to be rotated in opposite directions as the carriage travels back and forth, a series of spirally-arranged indices that extend more than once around said wheel or drum, an apertured shield that exposes but one index at a time on said wheel, and means for automatically effecting a movement of the shield back and forth in the general direction of the axis of the wheel or drum as the latter is rotated in opposite directions.

7. In a type-writing machine, the combination of a carriage, a wheel or drum connected to be rotated in opposite directions as the carriage travels back and forth and having a spiral groove therein, a series of spirally-arranged indices on said wheel or drum, a shield having a sight-opening therein, and means coöperating with said spiral groove and shield to automatically move the shield back and forth as the drum or wheel is rotated in opposite directions.

8. In a type-writing machine, the combination of a carriage, a wheel or drum geared to the carriage to be rotated in opposite directions thereby during the back-and-forth travel of the carriage and having a spiral groove therein, a series of spirally-arranged indices that extend more than once around said wheel or drum, a shield having a sight-opening therein that successively exposes the indices on the wheel or drum as it is rotated, and means coöperating with said spiral groove and shield to automatically move the shield back and forth as the drum or wheel is rotated in opposite directions.

9. In a type-writing machine, the combination of a carriage, means for affording a step-by-step letter-space movement of the carriage, a wheel, a series of spirally-arranged index-numbers extending around said wheel, one number for each letter-space movement of the carriage, means for causing the wheel to rotate in opposite directions during the back-and-forth travel of the carriage, a shield having a sight-opening therein, and means for automatically moving said shield back and forth as the wheel is rotated in opposite directions, to afford a successive reading of the spirally-arranged index-number at the sight-opening in the shield, and to at all times indicate the printing-point at the sight-opening whether the carriage be moving in the direction of its feed or in an opposite direction.

10. In a type-writing machine, the combination of a carriage, a wheel or drum that rotates in opposite directions as the carriage travels back and forth and which has a spiral groove therein, a series of spirally-arranged index-numerals that extend around said drum and conform substantially to the spiral arrangement of said index-numerals, a shield that coöperates with the wheel or drum to expose the index-numerals thereon one at a time, and means coöperating with the spiral groove in said wheel or drum and with said shield to move the shield back and forth in the general direction of the axis of the wheel or drum as the latter is rotated in opposite directions.

11. In a type-writing machine, the combination of a carriage, carriage-feed mechanism for affording a step-by-step feed movement of the carriage, a letter-space-indicating wheel which is carried by the frame of the machine and which is operatively connected to rotate in opposite directions as the carriage travels back and forth and which has a spirally-arranged groove therein, a series of spirally-arranged index-numerals on said wheel, a coöperating shield that has a sight-opening therein and is mounted to move back and forth in the general direction of the axis of said indicating-wheel as the wheel is rotated in opposite directions, and a pin that extends from said wheel and takes into said spiral groove.

12. In a type-writing machine, the combination of a carriage, a spring-drum for moving said carriage in the direction of its feed, escapement mechanism for affording a step-by-step feed movement of the carriage, a carriage index-wheel that is fixed against movement in an axial direction, intermediate gear connections between said wheel and spring-drum to turn the wheel in opposite directions as the carriage travels back and forth, a series of index-numerals located in different transverse planes on said wheel, a shield that is mounted to move in the general direction of the axis of said wheel, and means for automatically moving the shield back and forth when the said wheel is rotated in opposite directions.

13. In a type-writing machine, the combination of a carriage, a spring-drum for moving said carriage in the direction of its feed, escapement mechanism for affording a step-by-step feed movement of the carriage, a carriage index-wheel that is fixed against movement in an axial direction and has a spiral groove therein, intermediate gear connections between said wheel and spring-drum for effecting a rotation of the wheel as the carriage travels back and forth, a series of spirally-arranged index-numerals on said wheel, the spiral arrangement of the numerals corresponding substantially to the spiral groove, a shield that has a sight-opening therein and is mounted to move in the general direction of the axis of said wheel, and a projection extending from said shield into said spiral groove for automatically moving the shield back and forth when the said wheel is rotated in opposite directions.

14. In a type-writing machine, the combination of a carriage, means for affording a step-by-step letter-space feed movement of said carriage, a carriage index-wheel operatively connected to rotate in opposite directions as the carriage travels back and forth, a series of index-numerals extending more than once around said wheel, one number for each letter-space movement of the carriage, a movable shield, and means for automatically effecting a back-and-forth movement of the shield as the wheel rotates in opposite directions.

15. In a type-writing machine, the combination of a carriage, feed mechanism for affording a step-by-step feed movement of the carriage, a carriage index-wheel that rotates in opposite directions as the carriage travels back and forth, a series of index-numerals on said wheel and arranged at different points transversely thereof and the height of each index-numeral exceeding the distance covered by the carriage at its corresponding step-by-step feed movement, operative connections between the said wheel and carriage, a movable shield coöperating with said wheel, and means for automatically effecting a back-and-forth movement of the shield when the shield is rotated in opposite directions.

16. In a type-writing machine, the combination of a carriage, means for affording step-by-step feed movements of the carriage, a carriage index-wheel operatively connected to said carriage to travel at a greater rate of speed than the carriage as the latter travels back and forth, a series of index-numerals on said wheel, a shield having a sight-opening therein, and means for automatically moving the shield back and forth as the index-wheel is rotated in opposite directions.

17. In a type-writing machine, the combination of a carriage index-wheel that is operatively connected to rotate in opposite directions as the carriage travels back and forth, a shield having a sight-opening therein, and means for causing a coincident back-and-forth movement of the shield when the wheel is rotated, so as to bring the index-numerals successively into register with the sight-opening.

18. In a type-writing machine, the combination of a carriage, a carriage index-wheel controlled by the back-and-forth movement of the carriage, a casing that covers said wheel from observation, a shield that has a sight-opening therein and which is mounted to slide on the said casing, and means for automatically moving the shield back and forth when the wheel is rotated in opposite directions.

808,876. APPLIANCE FOR LIFTING AND TURNING DRILLS FOR ROCK-BORING AND OTHER PURPOSES. Charles Shannon, Paignton, England, assignor to Charles Shannon's "Drillite" Limited, London, England. Filed Jan. 19, 1904. Serial No. 189,782.

Claim.—1. A drill lifting and turning device comprising a stationary cylinder, a piston movable longitudinally and rotatively therein, spring-pressed gripping devices carried by the said piston, a cranked lever pivotally connected to the said cylinder and adapted to bear against the outer face of the piston, means connected with said cranked lever to force the piston inward and a foot-lever adapted to actuate said means; the lifting and turning of the drill being thus effected by the weight of the operator and as the result of his recovering the energy necessary for imparting the succeeding blow to the drill.

2. A drill lifting and turning device comprising a stationary cylinder, a piston movable therein, spring-pressed cam-levers carried by said piston, and friction-wedges also carried by said piston and actuated by the said cam-levers.

3. A drill lifting and turning device comprising a stationary cylinder, a piston movable therein, spring-pressed cam-levers carried by said piston, and friction-wedges also carried by said piston and actuated by the said cam-levers, said piston being provided with open slots having inclined surfaces for said wedges to slide in.

4. A drill lifting and turning device comprising a stationary cylinder, a piston movable longitudinally and rotatively therein, spring-pressed cam-levers carried by said piston, friction-wedges also carried by said piston in open slots therein having inclined surfaces, and a cranked lever pivotally connected to the said cylinder and adapted to bear against the outer face of the piston and operable by the foot.

5. A drill lifting and turning device comprising a stationary cylinder, a piston movable longitudinally and rotatively therein, spring-pressed cam-levers carried by said piston, friction-wedges also carried by said piston in open slots therein having inclined surfaces, a foot-operated cranked lever pivotally connected to the said cylinder and adapted to bear against the outer face of the piston, and means for rotating said piston when moved longitudinally in the said cylinder by the said foot-operated cranked lever.

6. A drill lifting and turning device comprising a stationary cylinder, a piston movable longitudinally and rotatively therein, spring-pressed gripping devices carried by the said piston, a cranked arm pivotally connected to the said cylinder and adapted to bear against the outer face of the piston, a foot-lever, a pivoted pawl on said foot-lever, and means actuated by said pawl and connected with and operating the said cranked lever.

7. A drill lifting and turning device comprising a stationary cylinder, a piston movable longitudinally and rotatively therein, spring-pressed gripping devices carried by the said piston, a cranked arm pivotally connected to the said cylinder and adapted to bear against the outer face of the piston, a foot-lever, a pivoted pawl on said foot-lever, and a cranked arm in operative relation to the said pivoted pawl and connected with the said cranked lever.

8. In a drill lifting and turning device, a stationary cylinder, a piston movable longitudinally and rotatively therein, a spring operating against the inner side of the piston, cam-levers carried by the piston and pressed by said spring, wedges also carried by the said piston and in operative relation to said cams, and inclined surfaces formed in slots in said piston for the said wedges to travel upon.

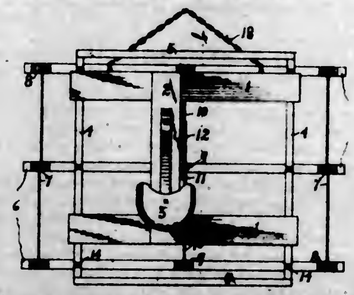
9. In apparatus for use in rock-boring or other purposes, a cylinder having straight and curved slots, a piston movable longitudinally and rotatively in said cylinder and carrying spring-pressed cam-levers and sliding wedges, circumferential grooves and teeth on the piston, an antifriction-rider for working in the said straight slot and an antifriction-rider for working in the said curved slot, projecting lugs on said respective riders for engaging in said grooves, a central spring-controlled tooth portion on each rider for engaging said teeth, and means adapted to move the piston against the pressure of the spring by the weight of the operator.

10. In apparatus for use in rock-boring or other purposes, the combination of the cylinder having straight and curved slots therein, a piston movable longitudinally and rotatively in said cylinder, circumferential grooves and teeth on said piston for engaging with the riders, antifriction-rollers on said riders, a tooth portion slidable transversely in each of said riders, and a spring threaded through the said slidable tooth portion.

11. In apparatus for use in rock-boring or other purposes, the combination of the cylinder having straight and curved slots therein, a piston movable longitudinally and rotatively in said cylinder, circumferential grooves and teeth in said piston, riders, antifriction-rollers on said riders for engaging lugs in said grooves, a tooth portion slidable transversely in each of said riders and engaging said teeth, a spring threaded through the said slidable tooth portion, a craned lever pivotally connected to the cylinder and bearing against the outer face of said piston, a pivoted arm, a connection between said lever and pivoted arm, and a foot-lever in operative relation to said pivoted arm.

12. In apparatus for use in rock-boring or other purposes, the combination with a lifting and turning device, of a foot-lever, the frame therefor, a strut or bar connection for said frame, a pawl on said foot-lever, a device operative by said pawl, and a cranked lever connected with said device for operating the lifting and turning device.

808,877. ROAD-LEVELING MACHINE. Clinton D. Smith, Russell, Iowa. Filed July 13, 1905. Serial No. 269,467.



Claim.—1. A road-leveling machine, consisting of a suitable frame, a series of drag-bars mounted beneath the same and secured thereto by means of a series of eyebolts, a series of longitudinal arms or bars pivotally mounted and secured to said drag-bars, and means for tilting said drag-bars to any desired inclination.

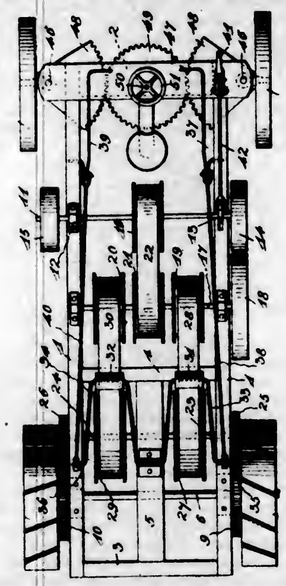
2. A road-leveling machine, consisting of a suitable frame, a series of drag-bars secured thereto, a series of longitudinal arms or bars pivotally secured to said drag-bars, and means for operating the same.

3. In a road-leveling machine, a series of drag-bars, a series of brackets mounted thereon, a series of longitudinal arms or bars pivotally mounted within said brackets, a second set of longitudinal arms or bars pivotally mounted in said brackets, and means for operating and adjusting said drag-bars.

4. In a road-leveling machine, the combination with a suitable frame, and a series of drag-bars adjustably secured thereto; of a series of brackets mounted on said drag-bars, a series of longitudinal arms or bars pivotally secured thereto, and means for operating and adjusting said drag-bars.

5. In a road-leveling machine, the combination with a series of drag-bars, a series of brackets mounted thereon, and a series of longitudinal arms or bars pivotally mounted within said brackets; of a second set of longitudinal arms or bars mounted within said brackets, means for connecting said first and second set of longitudinal arms or bars, and means for operating and adjusting the same.

808,878. TRACTION-ENGINE. Levi O. Smith and Francis B. Smith, South Sterling, Pa. Filed May 11, 1905. Serial No. 260,994.

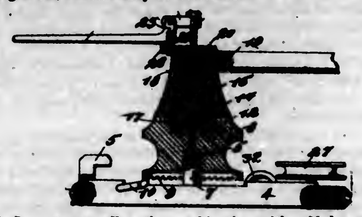


Claim.—1. A traction-engine having a driving-shaft, means to shift the same, a counter-shaft, pulleys and a belt connecting said driving-shaft and counter-shaft, gears to connect them when the driving-shaft is shifted to slacken the belt, so that the counter-shaft may be driven in either direction from the driving-shaft without reversing the latter, traction-wheels, and means to convey power to them from the said counter-shaft.

2. A traction-engine having a driving-shaft, means to shift the same, a counter-shaft, pulleys and a belt connecting said driving-shaft and counter-shaft, gears to connect them when the driving-shaft is shifted to slacken the belt, so that the counter-shaft may be driven in either direction from the driving-shaft without reversing the latter, traction-wheels, independently-revoluble shafts, gears respectively connecting them to the respective traction-wheels, pulleys on said independently-revoluble shafts and on said counter-shaft, slack belts connecting said pulleys, and means to tighten either or both of said slack belts at will, so that either or both of the traction-wheels may be driven simultaneously from the counter-shaft.

808,879. STUMP-PULLER. William Smith, La Crescent, Minn. Filed June 8, 1905. Serial No. 264,261.

Claim.—1. In a stump-puller, the combination with a V-shaped platform, of a base secured to said platform, an upwardly-projecting stub-axle secured to said base, a winding-drum revolubly mounted on said axle, a sweep-support having a horizontally-disposed opening to form a sweep-seat, a rectangular projection formed on the lower end of said support to engage a similarly-shaped recess in said winding-drum, a sweep secured in said opening, a centrally-disposed shaft extending through said sweep-support, and winding-drum and into said stub-axle, a lever connected to the upper end of said shaft, and means whereby said lever is connected with said sweep-support to raise and lower the same out of and into engagement with said winding-drum, substantially as described.

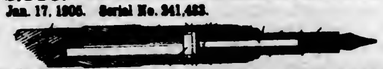


2. In a stump-puller, the combination with a V-shaped platform, of a base secured to said platform, an upwardly-projecting stub-axle secured to said base, a winding-drum revolubly mounted on said axle, a sweep-rest removably mounted in said winding-drum to turn the same, an anchoring-hook on said base, a pull-rope adapted to be detachably secured to said anchoring-hook, a sweep adapted to be firmly secured in said rest, and means to support the outer end of said sweep, substantially as described.

3. In a stump-puller, the combination with a platform consisting of two timbers bolted together at one end and diverging toward their other ends to form a V-shaped construction, a base-bar arranged across and secured to said platform-timbers, an anchor-hook formed on one end of said base-bar, an upwardly-projecting stub-axle secured to the center of said base-bar, a winding-drum revolubly mounted on said axle, a sweep-support arranged on said drum, and a sweep secured to said support, substantially as described.

4. In a stump-puller, the combination with a platform consisting of two timbers bolted together at one end and diverging toward their other ends to form a V-shaped construction, a base-bar arranged across and secured to said platform-timbers, an anchor-hook formed on one end of said base-bar, an upwardly-projecting stub-axle secured to the center of said base-bar, a winding-drum revolubly mounted on said axle, a sweep-support arranged on said drum, a sweep secured to said support, a pull-rope detachably connected to said winding-drum, a shorter sheave mounted on said base-bar, a snatch-block arranged on said pull-rope and hitch-ropes connected to said snatch-block, substantially as described.

808,880. FOUNTAIN-PEN. John A. L. Snyder, Scenic, Cal. Filed Jan. 17, 1905. Serial No. 241,483.



Claim.—1. A fountain-pen embodying a revoluble penholder, a stationary ink-feeder housed thereby and having a reduced side constituting an ink-channel in conjunction with the inner wall of the penholder.

2. A fountain-pen embodying a revoluble penholder provided with a cut-off, a stationary ink-feeder housed thereby and coacting with the cut-off, and a cap provided intermediate of its ends with means to engage the penholder to effect its turning when being applied or removed.

3. In a fountain-pen, the combination of a penholder, an ink-feeder arranged therein, a pen-feeder provided at its inner end with a tent, and a cut-off interposed between the pen-feeder and the ink-feeder and held from rotation by the tent.

4. In a fountain-pen, an ink-feeder, a penholder coacting therewith to control the flow of ink to the pen, and a cap or closure provided intermediate of its ends with means to actuate the holder.

5. A fountain-pen having a stationary ink-feeder, a revoluble penholder, a pen-feeder rigid with the holder, a cut-off interposed between the pen-feeder and the ink-feeder and held against rotation by the former.

6. A fountain-pen comprising a barrel, an ink-feeder rigid therewith, a penholder revolubly mounted upon the ink-feeder, a collar combined with the barrel and holder to maintain the latter in operative position, a pen-feeder carried by the penholder, and a cut-off disposed between the ink-feeder and pen-feeder.

7. A fountain-pen comprising a barrel, an ink-feeder rigid therewith, a penholder revolubly mounted upon the ink-feeder and carrying a packing, a collar combined with the barrel and engaging the packing to present an ink-tight joint, a pen-feeder carried by the penholder, and a cut-off combined with the pen-feeder and coacting with the ink-feeder.

9. A fountain-pen comprising a barrel open at both ends and provided intermediate of its ends with a shoulder or stop having recesses, a removable plug combined with one end of the barrel, an ink-feeder combined with the other end of the barrel and provided with a head to engage the said recesses, and with an abutment, a pen-holder revolubly mounted upon the ink-feeder and having a segmental stop to engage the abutment, a collar combined with the barrel for holding the penholder in position thereon, a pen-feeder carried by the penholder, and a cut-off interposed between the ink-feeder and the pen-feeder.

10. The combination with a barrel or ink-reservoir provided with interior recesses, of an ink-feeder reduced on one side to form a longitudinal ink-passage, and with one terminal constructed to engage the recesses, a penholder to inclose the feeder, and means to permit a partial revolution of the holder to open and close the ink-passage.

11. The combination with an ink-reservoir provided with interior recesses, of an ink-feeder constructed with a part to fit within the recesses, and with a projecting abutment, and a penholder provided at one end with a segmental stop to cooperate with the abutment to limit the rotary movement of the penholder to a partial revolution in either direction.

12. The combination with an ink-reservoir provided with interior recesses, of an ink-feeder constructed with a part to fit within the recesses and with a projecting abutment, a penholder provided with a segmental stop at its inner end, and a threaded collar to secure the penholder to the adjacent end of the reservoir.

13. The combination with a barrel provided with interior recesses, of an ink-feeder longitudinally reduced at one side to form an ink-passage and constructed with a part to fit within the recesses, and with projecting abutment, a penholder having a segmental stop at one end, means to connect the penholder and barrel and a pen-feeder to fit within the holder and provided with a longitudinal ink-passage.

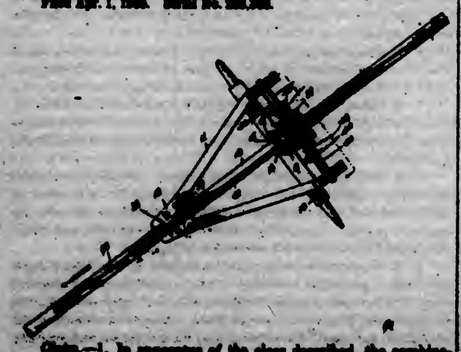
13. The combination with a barrel, of a stationary ink-feeder arranged therein and forming an ink-passage in conjunction therewith, a penholder detachably connected with the barrel and within which the feeder extends, means to permit a partial revolution only of the holder about the feeder, and a pen-feeder removably secured within the outer end of the holder and formed with a longitudinal groove or passage to register with the ink-passage in said holder.

14. A fountain-pen comprising a barrel provided intermediate of its ends with recesses, an ink-feeder provided with a head to engage the recesses and with means to limit its insertion within the holder, a penholder revolubly mounted upon the feeder, and means to maintain the holder against longitudinal movement relatively to the feeder.

15. A fountain-pen embodying a revolvable penholder, a stationary ink-feeder housed thereby and having a reduced side constituting an ink-channel in conjunction with the inner wall of the penholder, and a cap having means to engage frictionally with the penholder to effect turning thereof.

16. A fountain-pen having a stationary ink-feeder, a revolvable penholder, a pen-feeder rigid with the holder, a cut-off interposed between the pen and feeder and held against rotation by the former, and a cap having means coacting with the penholder to effect its rotation to control the feed of ink.

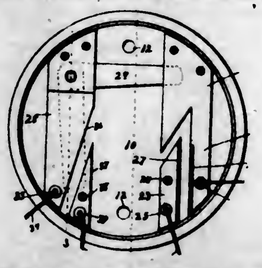
808,881. LOGGING-CART. MATHEW H. STEARS, Keams, La. Filed Apr. 1, 1905. Serial No. 253,303.



Claim.—1. In apparatus of the class described, the combination with the axle and bounds, of a shaft supported by the bounds, power and winding drums carried by the shaft, a tongue movable relatively to the bounds during the hoisting of the load, cables connecting both ends of the tongue to the power-drum, and flexible hoisting members carried by the winding-drum.

2. In apparatus of the class described, the combination with an axle having a guiding-slot, an antifriction-roller journaled in brackets above the slot, bounds secured to the axle and arranged on convergent lines, upper and lower plates connecting the ends of the bounds and forming in connection therewith a guide, a longitudinally-movable tongue extending through the guide and the slot, a catch pivoted to the tongue, a keeper carried by one of the plates and with which said catch engages, a flexible catch-operating member, an elevated yoke for supporting said flexible member, bearing-boxes carried by the bounds, a shaft mounted in the boxes, power and winding drums carried by the shaft, cables extending from the front and rear ends of the tongue and passing around said power-drum, flexible hoisting members mounted on the winding-drums, and a spring-buffer carried by the rear portion of the tongue and adapted to engage against the axle.

808,882. LIGHTNING-ARRESTER. FREDERICK A. STAFFORD, Charlton, Iowa. Filed Apr. 3, 1905. Serial No. 253,605.



Claim.—1. In a lightning-arrester for telephones, the combination of a base, a contact-plate on the base to be connected with a line-wire and designed to engage a switch-arm, a grounded plate adjacent to said contact-plate, a second contact-plate spaced apart from the first to be connected with a telephone-wire, a switch-arm connected to the second contact-plate and designed to be moved to and from position connecting with the first contact-plate, and a second grounded plate adjacent to the second contact-plate.

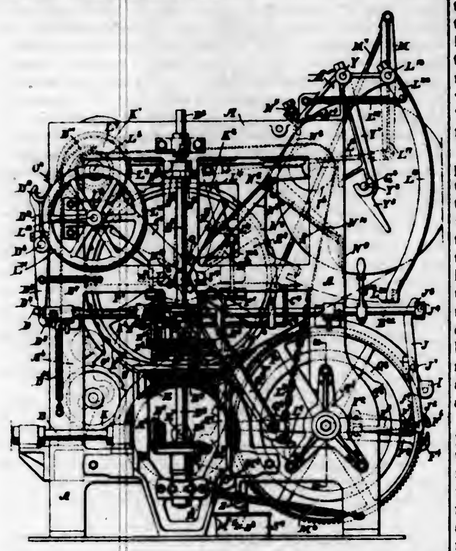
2. In a lightning-arrester for telephones, the combination of a contact-plate to be connected with a line-wire, a second contact-plate to be connected with a telephone-wire, a switch-arm to be connected with the second contact-plate and designed to be placed into or out of contact with the first contact-plate, a grounded plate adjacent to the second contact-plate, said grounded plate also designed to be connected with a telephone-wire, said second contact-plate and said grounded plate designed to be engaged by the switch-arm when it is out of engagement with the first contact-plate.

3. A lightning-arrester comprising a circular base with a flange, a detachable cover therefor provided with a packing-ring and fitted to the flange, a contact-plate secured to the base and comprising an inner and outer layer to receive a switch-arm between them and also formed with an upturned flange, a binding-post on said plate adjacent to the upturned flange to receive a line-wire, a grounded plate having an upturned flange adjacent to the upturned flange of the contact-plate, a second contact-plate, a binding-post thereon to be connected to a telephone-wire, a switch-arm connected with the second contact-plate, a second grounded plate adjacent to the second contact-plate and designed to be connected with a ground-wire and also with a telephone-wire, said switch-arm in one position engaging both the second contact-plate and the second grounded plate and a rod connected with the switch-arm for operating it

---

808,883. PAPER-FEEDING MACHINE. CHARLES D. STILWELL, Wayne, Pa. Filed Apr. 18, 1903. Renewed Apr. 8, 1905. Serial No. 254,553.

Claim.—1. In a paper-feeding machine, means for supporting a roll of paper from which paper is being drawn for use and means for guiding the web drawn from said roll through a determined path in the machine in combination with means for supporting a supplemental roll of paper, means for imparting to said supplemental roll a rotary motion which will cause its periphery to move with approximately the speed of the web in use, means for attaching the end of the web on the supplementary roll to the web in use without arresting the motion of either web, and means for shifting the supplemental roll to the supports for first roll.



2. In a paper-feeding machine, means for supporting a roll of paper from which paper is being drawn for use and means for guiding the web drawn from said roll through a determined path in the machine in combination with means for supporting a supplemental roll of paper, means for imparting to said supplemental roll a rotary motion which will cause its periphery to move with approximately the speed of the web in use, means for attaching the end of the web on the supplementary roll to the web in use without arresting the motion of either web, and means for shifting the supplemental roll to the supports for first roll.

3. In a paper-feeding machine, means for supporting a roll of paper from which paper is being drawn for use and means for guiding the web drawn from said roll through a determined path in the machine in combination with means for supporting a supplemental roll of paper, means for imparting to said supplemental roll a rotary motion which will cause its periphery to move with approximately the speed of the web in use, means for attaching the end of the web on the supplementary roll to the web in use without arresting the motion of either web and means actuated by the contracting diameter of the roll in use for setting in operation said means for attaching the web of the supplementary roll.

4. In a paper-feeding machine, means for supporting a roll of paper from which paper is being drawn for use and means for guiding the web drawn from said roll through a determined path in the machine in combination with means for supporting a supplemental roll of paper, means for imparting to said supplemental roll a rotary motion which will cause its periphery to move with approximately the speed of the web in use, means for severing the web in use from the roll, means for applying glue to the end of the web of the supplementary roll and means for carrying the pasted end into contact with the severed end of the first web to connect the webs together.

5. In a paper-feeding machine, means for supporting a roll of paper from which paper is being drawn for use and means for guiding the web drawn from said roll through a determined path in the machine in combination with means for supporting a supplemental roll of paper, means for imparting to said supplemental roll a rotary motion which will cause its periphery to move with approximately the speed of the web in use, means for severing the web in use from the roll, means for applying glue to the end of the web of the supplementary roll and means for carrying the pasted end into contact with the severed end of the first web to connect the webs together and means actuated by the receding diameter of the roll in use for setting in operation said cutting, pasting and web-connecting devices.

6. In a paper-feeding machine, having means for supporting a paper-roll in use and for guiding the web of paper from said roll through the machine, the combination of a support for a supplemental paper-roll with revoluble arms adapted to carry a "stick" or device on which the end of the paper on the supplemental roll is attached, a carrier movable in close relationship with the guides for the web in use and with the revolving arms aforesaid, said carrier being adapted to receive the "stick" from the arms and bring it and the paper end attached to it in contact with the web from the first roll, means for shifting the "stick" from the arms to the carrier when desired, means for applying glue to the paper end on the "stick" before it is brought in contact with the first web and means for arresting and starting the motion of the carrier.

7. In a paper-feeding machine having means for supporting a paper-roll in use and for guiding the web of paper from said roll through the machine, the combination of a support for a supplemental paper-roll with revoluble arms adapted to carry a "stick" or device on which the end of the paper on the supplemental roll is attached, a carrier movable in close relationship with the guides for the web in use and with the revolving arms aforesaid, said carrier being adapted to receive the "stick" from the arms and bring it and the paper end attached to it in contact with the web from the first roll, means for shifting the stick from the arms to the carrier when desired, means for applying glue to the paper end on the "stick" before it is brought in contact with the first web, a constantly-moving motor device, mechanism for actuating the carrier devices aforesaid and clutch mechanism for connecting and disconnecting said mechanism with the motor device.

8. In a paper-feeding machine having means for supporting a paper-roll and for guiding the web of paper from said roll through the machine, the combination of a support for a supplemental paper-roll with revoluble arms adapted to carry a "stick" or device to which the end of the paper on the supplemental roll is attached, a carrier movable in close relationship with the guides for the web in use and with the revolving arms aforesaid said carrier being adapted to receive the "stick" from the arms and bring it and the paper end attached to it in contact with the web from the first roll, means for shifting the "stick" from the arms to the carrier when desired, means for applying glue to the paper end on the stick before it is brought in contact with the first web, a constantly-moving motor device, mechanism for actuating the carrier devices aforesaid, a friction-clutch and a positive clutch both acting to engage the carrier mechanism and couple it to the motor device and means for engaging first the friction-clutch and afterward the positive clutch.

9. In a paper-feeding machine having means for supporting a paper-roll and for guiding the web of paper from said roll through the machine, the combination of a support for a supplemental paper-roll with revoluble arms adapted to carry a "stick" or device to which the end of the paper on the supplemental roll is attached, a carrier movable in close relationship with the guides for the web in use and with the revolving arms aforesaid said carrier being adapted to receive the "stick" from the arms and bring it and the paper end attached to it in contact with the web from the first roll, means for shifting the "stick" from the arms to the carrier when desired, means for applying glue to the paper end on the stick before it is brought in contact with the first web, a constantly-moving motor device, mechanism for actuating the carrier devices aforesaid, a friction-clutch and a positive clutch both acting to engage the carrier mechanism and couple it to the motor device, means for engaging first the friction-clutch and afterward the positive clutch and means actuated by the movement of the "stick" to release both clutches after the paper on the "stick" is attached to the web in use.

10. In a paper-feeding machine, the combination with the rotatable carrier-arms F^3 and the carrier-chains K^3 of mechanism for actuating said carriers, a positively-moving motor device, clutch mechanism for coupling said motor to the carrier-driving mechanism, a rock-shaft B^{32} for moving the clutch mechanism, means tending to shift the shaft B^{32} to a position to release the clutches, a catch acting to hold the shaft in clutch-engaging position, a paper-holding "stick" adapted to be engaged and moved successively by the carrier-arms and the carrier-chains and means for releasing the catch holding the clutch-shaft B^{32} in operative position arranged to be actuated by the "stick" when moving with the chains K^3.

11. In a paper-feeding machine, the combination with the rotatable carrier-arms F^3 and the carrier-chains K^3 of mechanism for actuating said carriers, a positively-moving motor device, a friction-clutch B^{31} B^{32} for coupling said motor and the carrier-driving mechanism, a clutch-locking tooth C^9 movably secured to one clutch member and adapted in one position to positively lock the clutch members together, a rock-shaft B^{33} coupled to the movable friction-clutch member so as to move it to and from operative position and coupled to the

locking-teeth so as to move it from but not to operative position, means tending to move the rock-shaft to release the clutch devices, a catch adapted to hold it in operative position, a tooth-actuating lever C^6 C^6 pivoted on the movable friction-clutch member, a manually-operative block C^9 arranged to engage and operate said lever to engage the clutch-teeth and a paper-holding "stick" adapted to be engaged and moved successively by the carrier arms and chains and to act on the rock-shaft catch to release it when moved by the carrier-chains.

12. In a paper-feeding machine, the combination of the revoluble carrier-arms F^6 having fixed and movable jaws H^6 F^6 for holding the "stick" with the carrier-chains K^5 having "stick-holding" sockets K^6 adapted to register with the movable jaws F^6, sprocket-wheels F^5 over which chains K^5 pass, pivoted jaws c^3 secured to said wheels and the hook-lever M^6 having a hook M^9 adapted to engage and open jaw F^6 and a cam M^7 adapted to engage and move the jaw c^3 so as to move the stick from the arms F^6 to the sockets in chains K^5.

13. In a paper-feeding machine having a support for a paper-roll in use and a guide-drum L' over which the web from said roll passes, a support for a supplemental roll of paper, in combination with carrier-arms F^6 revoluble around said support and having fixed and movable "stick-holding" jaws H^6 F^6, a carrier-chain K^5 having sockets K^6 adapted to register with the movable jaws of the arms F^6 as the arms and chain revolve, sprocket-wheels supporting and guiding the chain carriers so that they move practically parallel with the guide-drum for a part of their length, means for releasing the "stick" from the arms F^6 and engaging it with the sockets of the chain carrier and means for pressing the "stick" against the guide-drum as it is carried over it.

14. In a paper-feeding machine having a support for a paper-roll in use and a guide-drum L' over which the web from said roll passes, a support for a supplemental roll of paper, in combination with a "stick" adapted to hold the end of the supplemental roll of paper, said "stick" having the trunnion-shafts H^3 and crank-arms H^4 H^5 extending from said shafts, carrier-arms F^6 revoluble around said support and having fixed and movable "stick-holding" jaws H^6 F^6 adapted to engage the crank-arm H^5 and the ends of shafts H^3 of the "stick," a carrier-chain K^5 having sockets K^6 adapted to register with the movable jaws of the arms F^6 as the arms and chain revolve and engage the stud-shafts H^3, sprocket-wheels supporting and guiding the chain carriers so that they move practically parallel with the guide-drum for a part of their length, means for releasing the "stick" from the arms F^6 and engaging it with the sockets of the chain carrier and cams U acting to engage the crank-arms of the stick and press it against the guide-cylinder.

15. In a paper-feeding machine the combination of the guide-drum L', the carrier-chains K^5 and the rolls O' held against the drum by elastic pressure and adapted to press the stick against said drum.

16. In a paper-feeding machine the combination with the guide-drum L' and carriers K^5 K^6 of the "stick," guides O^4 and O^4 arranged to withdraw the "stick" from the drum and release the paper as specified.

17. In a paper-feeding machine the combination with a constantly-acting motor and a clutch device whereby its motion is communicated to the moving parts of the machine, a latch holding the clutch in operative position, carriers K^5 constituting one of the parts actuated through the clutch, a "stick" adapted to hold the end of a web of paper and to be moved by the carriers, a guide O^4 arranged to gradually withdraw the "stick" from the carriers and a lever D^{11} arranged to be acted on by the "stick" moving through guide O^4 and to act to release the clutch-latch.

18. In a paper-feeding machine having a positively-driven shaft and moving parts driven by said shaft through a clutch, the combination with mechanism for pasting the end of a reserve roll of paper to a web in use, of mechanism for operating said pasting and applying devices comprising a cam, as N^{32}, directly connected to the positively-driven shaft and a cam q^2 connected with the driven mechanism whereby said devices are prevented from operating except in a definite relation to the motion of the driving-shaft, as well as to the movements of the driven mechanism.

19. In a paper-feeding machine having bearings for rolls of paper in use and in reserve and means for rotating the reserve roll with a speed corresponding to that of the web drawn from the roll in use, a paper-covering device adapted to act on the web in use in combination with mechanism for attaching the web of the reserve roll to the covered end of the web in use and moving toward the bearings thereof as the roll contracts and mechanism actuated by said moving part as it approaches the line of the roll-bearings for setting in operation the covering and paper-attaching devices.

20. In a paper-feeding machine having bearings for rolls of paper in use and in reserve and means for rotating the reserve roll with a speed corresponding to that of the web drawn from the roll in use, a cutter L^{30} supported on pivoted arms L^{19}, means tending to draw the cutter in across the web of paper, a stop-lever holding said cutter in non-operative position, means for attaching the end of the reserve roll of paper to the web in use and mechanism for releasing the cutter from the stop-lever and for setting in operation the mechanism operating to attach the paper of the reserve roll to the web in use said mechanism consisting in part of devices supported on the roll in use and moving toward operative position as the said roll contracts and in part of a device operated by the means acting to rotate the reserve roll whereby the cutting and attaching devices operate in a fixed rotation to the position of the rotating devices.

21. In a paper-feeding machine having bearings for rolls of paper in use and in reserve and means for rotating the reserve roll with a speed corresponding to that of the web drawn from the roll in use, a cutter L^{30} supported on pivoted arms L^{19}, means for attaching the end of the reserve roll to the web in use, a cutter L^{30} secured on pivoted arms, means tending to draw said cutter toward the web in use, a stop-lever acting to hold the cutter out of operation, means connecting the cutter and the paper-attaching mechanism whereby they act simultaneously, a device for acting on the stop-lever and releasing the cutters supported on the roll in use and moving toward operative position as the roll contracts and a coacting device operated by the revolving mechanism of the reserve roll whereby the cutter is released in a fixed relation to the position of said revolving mechanism.

22. In a paper-feeding machine having bearings for rolls of paper in use and in reserve and means for rotating the reserve roll with a speed corresponding to that of the web drawn from the roll in use, gluing mechanism for applying glue to the end of the web of the reserve roll, mechanism for applying the glued end of the reserve web to the web in use, cutter L^{30} secured on pivoted arms, means tending to draw said cutter toward the web in use, a stop-lever acting to hold the cutter out of operation, means connecting the cutter and the paper gluing and attaching mechanism whereby they act simultaneously, a device for acting on the stop-lever and releasing the cutter supported on the roll in use and moving toward operative position as the roll contracts and a coacting device actuated by the revolving mechanism of the reserve roll whereby the cutter is released the glue applied and the webs attached in a fixed relation to the position of said revolving mechanism.

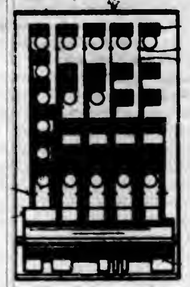
23. In a paper-feeding machine having bearings for a roll of paper in use and a roll in reserve the combination with means for revolving the roll in reserve, means for cutting off the web from the roll in use and for securing the end of the reserve roll to the end of the web in use, of a rock-shaft *l*, a lever secured thereto and having its free end supported on the roll in use so as to move down as said roll contracts and mechanism supported by and moving with the rock-shafts for setting in operation the cutter and the attaching devices when the roll in use is reduced to a determined diameter.

24. In a paper-feeding machine having bearings for a roll of paper in use and a roll in reserve, the combination with means for revolving the roll in reserve, means for cutting off the web from the roll in use and for securing the end of the reserve roll to the end of the web in use, of a rock-shaft *l*, a lever secured thereto and having its free end supported on the roll in use so as to move down as said roll contracts, mechanism supported by and moving with the rock-shaft for setting in operation the cutter and the attaching devices when the roll in use is reduced to a determined diameter, a cam moving in fixed relationship with the roll-revolving mechanism and means controlled by said cam for assisting the final operative movements of the devices acting on the cutter and applying devices until they can operate in a determined relationship to the revolving devices.

25. In a paper-feeding machine having bearings for rolls of paper in use and in reserve and means for transferring the reserve roll to the bearings for the roll in use, the combination of guide-plates for the web in use situated between the bearings for the two rolls and means for shifting said guide-plates out of the path traveled by the reserve roll on its way to the bearings for the roll in use actuated by the transferring mechanism.

26. In a paper-feeding machine having bearings for rolls of paper in use and in reserve and means for transferring the reserve roll to the bearings for the roll in use, the combination of a cutter L^{30} for cutting off the web from the roll in use, a stop-lever for holding the cutter out of operation and means operated by the transferring device for shifting the cutter out of the path of the moving roll and engaging it with said stop-lever.

808,884. AUTOMATIC SIGN-CHANGING LETTER. EDWARD C. THOMAS and CHARLES F. JENKINS, Washington, D. C. Filed Oct. 19, 1905. Serial No. 283,494.



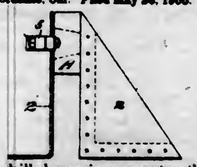
Claim.—1. In a changing-sign letter of the character described, the combination of a plate having openings therein relatively so located that unitary designs may be formed thereby, shutters, one for each opening, and means for moving said shutters in right lines to cover and uncover the openings.

2. In a changing-sign letter of the character described, the combination of a plate having openings therein relatively so located that unitary designs may be formed thereby, shutters, one for each opening, and means for moving said shutters in right lines to cover and uncover the openings, and a plurality of keys having projections arranged in a predetermined manner for successively moving said shutters to cover and uncover the openings to produce predetermined designs.

808,885. PIVOT-BOLT FOR LOOM-SHUTTLE SPINDLES. CHARLES F. THOMPSON, Oswego Falls, N. Y. Filed Sept. 26, 1904. Serial No. 225,999.

Claim.—A loom-shuttle having a recess in one end, a plate gained in one wall of the said recess and provided with a screw-threaded opening, the said wall of the said recess and provided with a screw-threaded opening coincident with the threaded opening in the plate and further provided with a countersink at the outer end of the said unthreaded opening, the opposite wall of the shuttle having an unthreaded opening of reduced diameter, in combination with a spindle having its pivotal end in said recess and provided with an unthreaded opening registering with the unthreaded opening of reduced diameter in one wall of the shuttle, and a bolt having an unthreaded stem portion in the unthreaded opening of the spindle and one wall of the shuttle, a screw-threaded portion of enlarged diameter in the screw-threaded opening of the plate and in the unthreaded opening of the shuttle-wall contiguous to said plate, said bolt being further provided with an enlarged head in the said countersink of the shuttle, and serving to firmly clamp the plate in place, the latter serving to lock the bolt, for the purpose set forth substantially as described.

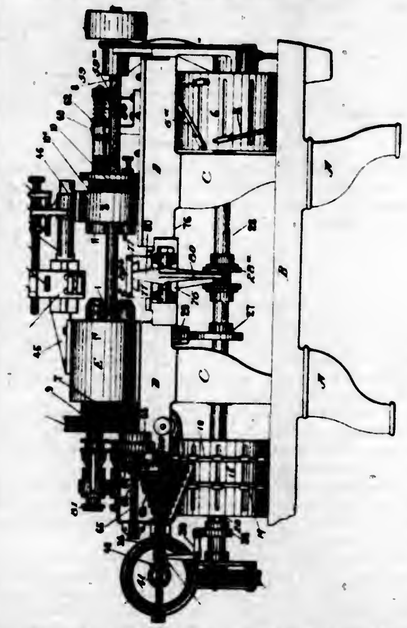
808,886. DRILL SHARPENER, SHAPER, AND GAGER. JAMES T. THOMPSON, Tuolumne, Cal. Filed May 26, 1905. Serial No. 262,355.



Claim.—1. In a drill-sharpening apparatus, the combination of a swage-block having a tapered die-recess, a removable sectional die fitting said recess, said die inclosing a tapered chamber corresponding to the drill-head to be produced, a tapered dolly fitting and closing an end of said chamber, and means for holding the dolly in position.

2. In a drill-sharpening apparatus, a suitably-supported swage-block having a horizontal tapered die-recess, a correspondingly-tapered sectional die fitting said recess, said die inclosing a space contracted at one end corresponding with the shape and size of a drill-shank and spreading out at the other end corresponding with the head of the finished drill, a tapered dolly fitting said die, and a locking-bar to hold said dolly in the die.

808,887. SCREW-MAKING AND METAL-TURNING LATHE. HENRY P. TRUEMAN and EDWARD D. CLEGHORN, Worcester, England. Filed Dec. 20, 1902. Serial No. 136,880.



Claim.—1. In screw-making and metal-turning lathes, the means for enabling various thicknesses of work to be operated upon, consisting in the combination of a work-spindle, a feed-tube carried within said work-spindle, and having an interior screw-thread at one end, a feed-shell having an exterior screw-thread at its inner end, and a reducing-socket having one end screw-threaded internally and adapted to receive the externally-screw-threaded end of the feed-shell and having its other end screw-threaded externally and adapted to screw into the feed-tube, substantially as specified.

2. In screw-making and metal-turning lathes, in which a supplemental tool-carrier is employed; means for imparting a sliding movement to said tool-carrier, said means comprising a shaft having a worm-wheel and crank for actuating said tool-carrier, a worm-shaft to actuate said worm-wheel; a bearing-bracket upon the main tool-slide for supporting said shaft; an arm for supporting said tool-carrier, and an extension on said arm, the bearing-bracket for the worm-shaft having an opening or guide through which said extension slides; in combination with stops and springs for automatically operating said tool-carrier, said stops being rigidly carried upon said worm-shaft, one on each side of said bearing-bracket, and said springs being interposed between said stops and said bearing-bracket, substantially as specified.

3. In screw-making and metal-turning lathes, the cutting-off slideways held upon the main frame and capable of angular adjustment; the actuating-lever of said cutting-off slideways; the telescoping ball-joints of said actuating-lever; and the grooved guides along which the ball-joints of said actuating-lever operate, said grooved guides being attached to the tool-slides, substantially as specified.

4. In stock-feeding mechanism for screw-making and metal-turning lathes the combination with the feed-slides and the feed-spools operated by said feed-slides; of means for retaining said feed-spools in their retracted positions, said means consisting of balls arranged to lie in a groove in the feed-spool; recesses in the end of the feed-tube, in which are located said balls; and springs located in said recesses and arranged to exert a pressure on said balls, substantially as specified.

9. In screw-making and metal-turning lathes of the multispindle type, means for enabling the tool-slides to be adjusted to compensate for wear, said means comprising the combination with side strips, capable of adjustment to compensate for the wear on the sides of the tool-slide; of screw and clamp bolts for adjustment; and blocks fitted in spaces; and the spaces formed in the under side of the tool-slide, said blocks being capable of vertical adjustment to compensate for wear on the bottom of the tool-slide; and the set-screws for adjusting vertically, substantially as specified.

6. In screw-making and metal-turning lathes, means for operating the feed-spools, said means comprising a clamp-slide; a feed-slide arranged to slide upon said clamp-slide; a cam-pin upon said clamp-slide and a cam-pin upon said feed-slide, said pins being arranged to be operated by cam-stripe upon a cam-drum; and the said cam-drum and the said cam-stripe upon said cam-drum, substantially as specified.

808,888. **LENS-MOUNTING FOR EYEGLASSES.** JOHN R. VAN TASSEL, Geneva, N. Y., assignor to The Standard Optical Company, Geneva, N. Y., a Corporation of New York. Filed July 10, 1905. Serial No. 269,063.

Claim.—1. A one-piece lens-mounting consisting of a strip of metal folded upon itself forming an open loop or box and ears, the opposite arms being brought together at one edge of the lens between the ears and box for forming a comparatively thin neck, said box being offset beyond the plane of the lens, and also disposed in a horizontal plane above the ears.

2. A one-piece lens-mounting for eyeglasses consisting of a strip of metal folded upon itself, its intermediate portion forming a box which is disposed at one side of both the horizontal and vertical planes of the ends of the strip.

3. A lens-mounting for eyeglasses comprising lens-clamping ears, a box and a comparatively thin neck connecting the ears to the box, said neck being disposed at an angle with the ears, and the box being offset to one side of the neck.

4. A one-piece lens-mounting for eyeglasses consisting of a strip of metal folded upon itself, its intermediate portion forming an open loop or box and its ends being disposed in parallel planes spaced apart to receive the lens, one of the opposite arms being offset toward the other to bring portions of the two arms together forming a comparatively thin neck between the box and lens, said neck being inclined at an angle with the mechanical axis of the lens, and the box being offset and disposed in a plane at one side of the lens.

5. A one-piece mounting for an eyeglass, said mounting consisting of a strip of metal folded upon itself, the intermediate portion being deflected vertically at an angle with the ends and forming an open box which is disposed in a vertical plane at one side of the ends of the mounting.

6. In combination with a lens, a strip of metal folded upon itself and having its ends secured to the opposite faces of the lens, one of the opposite arms being offset laterally across the edge of the lens and provided with a projection engaging the edge of the lens, the intermediate portion of said strip forming an open loop located at one side of the vertical plane of the lens for the purpose described.

7. A lens-mounting for eyeglasses comprising an ear secured to the lens and offset laterally across the edge of the lens, said offset having oppositely-projecting lens-guards bearing upon the edge of the lens, a box united to the ear in combination with a bow and nose-guard secured within said box.

8. A lens-mount for eyeglasses comprising an ear secured to the lens in line with its mechanical axis, a box rigidly connected to the ear and located in a plane at one side of the mechanical axis and also disposed in a plane at one side of the vertical plane of the lens.

9. A one-piece lens-mounting for eyeglasses consisting of a strip of metal folded upon itself, its central portion forming a loop or box and the ends spaced apart to receive the lens, the portions between the ends and box being brought into juxtaposition to form a comparatively thin neck, said neck being deflected vertically at an angle with the ends and the box being offset horizontally beyond the plane of said ends for the purpose described.

10. A lens-mounting consisting of a strip of metal having its intermediate portion bent into the form of a loop or box and its ends separated forming ears to receive the lens, the portions of the strip between the box and ears being brought together to form a comparatively thin neck, and means to secure the ears to the lens.

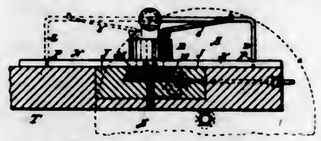
11. A lens-mounting having a box open at both ends, a bow and a nose-guard each having one end inserted into the box and a U-shaped washer also inserted in the box and receiving one of said ends, one side of the washer being interposed between one side of the box and the adjacent end of one of the other parts inserted in said box and a clamping-screw having a head engaged with one side of the washer and having its threaded end engaged with the threaded aperture in the opposite side of the box.

12. In a lens-mounting, the combination with a lens, a one-piece strip of metal having its ends secured to opposite faces of the lens and its intermediate portion forming a box, and a bow and nose-guard each having one end secured in the box.

13. In combination with a lens, a one-piece strip of metal having its ends secured to opposite faces of the lens and its intermediate portion forming a rectangular box, and a nose-guard having one end inserted in the box, and means to secure said end in the box.

14. In combination with a lens, a one-piece strip of metal having its ends secured to opposite faces of the lens and its intermediate portion forming a rectangular box, one of the ends of said strip having oppositely-projecting spurs forming lens-guards engaging the edge of the lens.

808,889. **CUTTING-GAGE FOR SAW-TABLES.** CLAYTON VON CULIN, Wayland, N. Y. Filed Nov. 12, 1904. Serial No. 233,441.



Claim.—The combination with a saw-table and a rail therein having slideways, of a saw-table gage having a base or slide adapted to engage and slide in said ways the said base and rail having each a series of perforations adapted for interchangeable registration and means for engagement therewith to secure adjustment of the gage and means for adjusting said slide so that the perforations in the slide-rail may not always register, the said base or slide having a close fit as to its lateral edges with said way but providing a longitudinal space beneath its bottom surface and the bottom of said slideway and perforations in the rail carried through the table, so that dust sifting through the perforations in the slide if carried by the slide in its adjustment which might otherwise clog in the slide will not prevent free sliding motion of the slide and may in such manner be permitted to escape through non-registering perforations in the bottom of the slideway.

808,890. **SINGLE-TRIGGER MECHANISM FOR FIREARMS.** GEORGE B. WITHERELL, Hartford, Conn., assignor to Remington Arms Company, Ilion, N. Y., a Corporation of New York. Filed May 23, 1902. Serial No. 108,062.

Claim.—1. In a multi barrel firearm having a plural number of hammers and a plural number of sears and their appurtenant parts, a coupler mounted on each of the sears and adapted to engage and operate the opposite sear, a trigger, and a connection between the trigger and sears adapted to initially engage either sear and subsequently operate the other sear without changing its position.

2. In a multi barrel firearm having a plural number of hammers and a plural number of sears and their appurtenant parts, a coupler mounted on each of the sears and adapted to engage and operate the opposite sear, said couplers controlled by the hammers, a trigger and a connection between the trigger and sears adapted to initially engage either sear and subsequently operate the other sear without changing its position.

3. In combination, in a firearm having a plurality of barrels, hammers, sears, and appurtenant parts, a trigger for actuating said sears, provided at its upper and under sides with recesses, a thumb-lever projecting into the lower recess and a sear-actuating lever projecting into the upper recess, said levers rigidly connected by a pin passing through the trigger adjacent to the recesses and a spring-detent appurtenant to the upper recess adapted to hold the parts in positive position of adjustment.

4. In a multi barrel firearm having a plural number of hammers and a plural number of sears and their appurtenant parts, a trigger, means intermediate the sears and trigger for automatically operating one of said sears after the operation of the other of said sears, a connection mounted on the trigger adapted to initially operate either of said sears and means for temporarily preventing the action of the automatic sear-operating means.

5. In a multi barrel firearm having a plural number of hammers and a plural number of sears and their appurtenant parts, automatic connections intermediate the sears whereby one of said sears may be operated after the other of said sears, a trigger for operating both of said sears, a connection mounted on the trigger and adapted to initially operate either of said sears, and elastically-controlled means for preventing the operation of the automatic sear-actuating means.

6. In a multi barrel firearm having a plural number of hammers and a plural number of sears and their appurtenant parts, a trigger for actuating said sears, a connection mounted on the trigger and co-operating with the trigger to initially operate either of said sears, an automatic connector adapted to couple said sears after either has been moved, and elastically-controlled means for temporarily preventing operative movement of the trigger and its connection.

7. In a multi barrel firearm having a plural number of hammers and a plural number of sears and their appurtenant parts, a coupler mounted on one of said sears and adapted to engage the opposite sear, a trigger, a connection cooperating with the trigger and adapted to initially operate either of the sears and subsequently operate the other sear without changing its position, and elastically-controlled means for temporarily preventing a sear-actuating movement of the trigger and connection.

8. In a multi barrel firearm having a plural number of hammers and a plural number of sears and their appurtenant parts, a coupler located on one of the sears and adapted automatically to engage the opposite sear, a trigger, a connection mounted on the trigger and adapted to initially operate either sear, means for moving said connection and elastically-retracted means for temporarily preventing the automatic action of said coupler.

9. In a multi barrel firearm having a plural number of hammers and a plural number of sears and their appurtenant parts, a coupler mounted on one of the sears and adapted automatically to engage the opposite sear, a trigger, a connection mounted on the trigger and adapted to initially connect the trigger with either sear, means located outside of the piece for moving said connection, and elastically-retracted means for temporarily preventing the automatic action of the coupler.

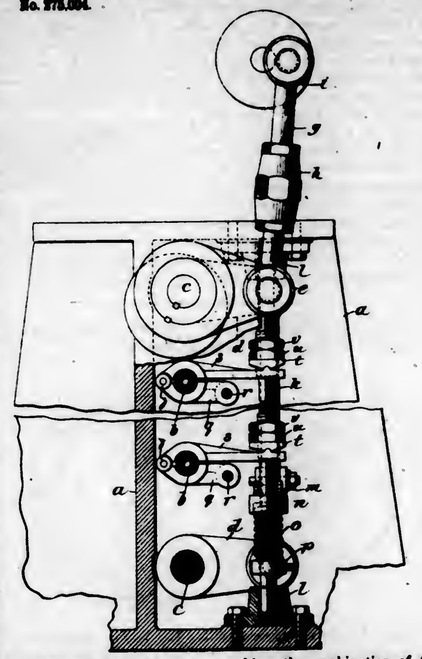
10. In a multi barrel firearm having a plural number of hammers and a plural number of sears and their appurtenant parts, a coupler mounted on one of the sears and adapted automatically to engage the opposite sear, a trigger, a connection mounted on the trigger and adapted to initially operate either sear, means located on the trigger for moving said connection, and elastically-retracted means for temporarily preventing the automatic action of the coupler.

11. In a firearm having a plural number of barrels, hammers and sears with their appurtenant parts, a trigger, a shifting trip borne on the trigger and pivoted at one end and with its other end lying below the sears, the pivot secured to said trip and extending into the trigger, a lever having one end secured to the pivot and its opposite end extending in the same direction as the sear end of the trip whereby the trip and lever have identical movements and means for resiliently holding said trip and lever in their various positions of adjustment.

808,891. **HORSESHOE-CALK.** BRUCE F. ATHERTON, Macedon, N. Y. Filed July 19, 1904. Serial No. 217,247.

Claim.—As a new article of manufacture, a horseshoe-calk comprising a body tapered to a longitudinal edge and having a laterally-extended flange at the opposite edge to provide an extended welding-face, the lower or tread side of the lateral flange being beveled, and having an oblique cut extended through opposite faces and having the partly-severed portion pressed outward at a right angle to the welding-face of the calk to form a pointed spur and leaving a diagonal surface or wall in the flange perpendicular or at a right angle to said welding-surface.

808,892. **SPINDLE-BRAKE DEVICE FOR WIRE-FENCE MACHINES.** AXEL F. BACKLIN and IRONY BELLIES, Worcester, Mass., assignors to The American Steel & Wire Company of New Jersey, Worcester, Mass., a Corporation of New Jersey. Filed Aug. 31, 1905. Serial No. 276,094.



Claim.—1. In a wire-fence machine, the combination of the coiler-spindles, a brake device for each spindle, and means connected with the stay-cutter-actuating mechanism for applying the brakes.

2. In a wire-fence machine, the combination of the coiler-spindles, a pivoted brake device for each spindle, and means connected with the stay-cutter-actuating mechanism for applying the brakes.

3. In a wire-fence machine, the combination of the coiler-spindles, brake devices for the several spindles, and means operated from the main drive-shaft of the machine for alternately engaging and disengaging the spindles and brake devices.

4. In a wire-fence machine, the combination of the coiler-spindles, brake devices for the several spindles pivoted to the machine-frame adjacent to the spindles, and means operated from the main drive-shaft of the machine for causing said brake devices to move into and out of engagement with the corresponding spindles.

5. In a wire-fence machine, the combination of the coiler-spindles, a brake device for each spindle, a reciprocating bar engaging the several brake devices, and connections between said bar and the stay-cutter-actuating mechanism, whereby the bar is moved to apply the brakes when the stay-wires are cut and to release the brakes during the coiling operation.

6. In a wire-fence machine, the combination of the coiler-spindles, a brake device for each spindle pivoted to the machine-frame, a reciprocating bar engaging the several brake devices, and connections between said bar and the stay-cutter-actuating mechanism whereby the bar is moved to apply the brakes when the stay-wires are cut and to release the brakes during the coiling operation.

7. In a wire-fence machine, the combination of the coiler-spindles, a brake device for the several spindles, each comprising a pair of pivotally-connected shoes embracing the corresponding spindle and pivoted at one end to the machine-frame, a reciprocating rod engaging the free end of each brake device, and means operated from the main drive-shaft of the machine for operating said rod to apply and release the brakes.

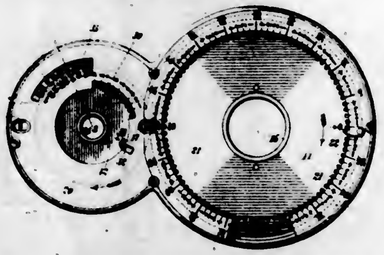
8. In a wire-fence machine, the combination of the coiler-spindles, a brake device for the several spindles, each comprising a pair of pivotally-connected shoes embracing the corresponding spindle and pivoted at one end to the machine-frame, a reciprocating rod en-

gaging the free end of each brake device, and connections between said bar and the stay-cutter-actuating mechanism for moving said bar to apply the brakes when the cutters are operated.

9. In a wire-fence machine, the combination of the coiler-spindles, a brake device for the several spindles, each comprising a pair of pivotally-connected shoes embracing the corresponding spindle and pivoted at one end to the machine-frame, a reciprocating rod engaging the free end of each brake device, rock-shafts for operating the stay-cutter bar, a connecting-rod between said shafts, and a yoke fixed to said connecting-rod and engaging the reciprocating rod to move the latter to apply the brakes.

10. In a wire-fence machine, the combination of the coiler-spindles, a brake device for the several spindles, each comprising a pair of pivotally-connected shoes embracing the corresponding spindle and pivoted at one end to the machine-frame, a reciprocating rod engaging the free end of each brake device, rock-shafts for operating the stay-cutter bar, a connecting-rod between said shafts, a yoke fixed to said connecting-rod, and a spring-pressed collar on the reciprocating rod engaging said yoke, whereby the brakes will be yieldingly applied to the spindles when the stay-cutters are operated.

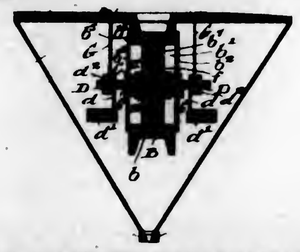
808,893. **ADDING-MACHINE.** EDWIN R. BEACH, Jersey City, N. J. Filed Mar. 23, 1905. Serial No. 252,470.



Claim.—1. In an adding-machine, the rotatively-mounted units and tens dial bearing the line of numerals along its outer edge and having the series of apertures adjacent thereto, to receive a stylus for rotating said dial, the fixed ring-dial over the outer portion of said rotary disk-dial and bearing numbered graduation-marks extending around it along the line of said apertures, which are exposed close along the inner edge of said ring-dial so that the stylus may be guided by said edge, a stop projecting inwardly over the said rotary dial to arrest the stylus at a given point, the rotatively-mounted hundreds-disk dial in horizontal line with said units and tens dial and whose peripheral edge substantially meets the same at a given reading-point, said hundreds-dial bearing the circular line of numerals and having the circular line of apertures to receive a stylus, a plate over said hundreds-dial and having an opening to expose some of said apertures therein and said plate being numbered along the line of said exposed apertures, and means for transmitting motion from the units and tens dial at each rotation of the same, to said hundreds-dial, combined with a thousands-dial in the form of a ring encompassing but slightly lower than said hundreds-dial and extending at one edge below said units and tens dial and said thousands-dial bearing the circular line of numerals and having the circular line of apertures to receive a stylus for actuating the same, a plate over said thousands-dial having an opening to expose some of the apertures therein and said plate bearing guiding-numerals along the edge of said opening, and means for actuating said thousands-dial at each rotation of said hundreds-dial, all of said dials being horizontally disposed within a casing and said machine having reading-openings for said dials; substantially as set forth.

2. In an adding-machine the rotatively-mounted units and tens dial bearing the line of numerals along its outer edge and having the series of apertures adjacent thereto to receive a stylus for rotating said dial, the fixed ring-dial over the outer portion of said rotary disk-dial and bearing numbered graduation-marks extending around it along the line of said apertures, which are exposed close along the inner edge of said ring-dial so that the stylus may be guided by said edge, a stop projecting inwardly over the said rotary dial to arrest the stylus at a given point, the rotatively-mounted hundreds-disk dial in horizontal line with said units and tens dial and whose peripheral edge substantially meets the same at a given reading-point, said hundreds-dial bearing the circular line of numerals and having the circular line of apertures to receive a stylus, a plate over said hundreds-dial and having an opening to expose some of said apertures therein and said plate being numbered along the line of said exposed apertures, and means for transmitting motion from the units and tens dial at each rotation of the same, to said hundreds-dial, combined with a thousands-dial in the form of a ring encompassing but slightly lower than said hundreds-dial and extending at one edge below said units and tens dial, and said thousands-dial bearing the circular line of numerals and having the circular line of apertures to receive a stylus for actuating the same, a plate over said thousands-dial having a segmental opening to expose some of the apertures therein and said plate bearing guiding-numerals along the edge of said opening, a star-wheel engaging recesses in the lower side of said thousands-dial and connected with a second star-wheel, and an arm carried by said hundreds-dial for engaging said second wheel at each rotation of said hundreds-dial and actuating said thousands-dial, all of said dials being horizontally disposed within a casing and said machine having reading-openings for said dials; substantially as set forth.

808,894. **ADJUSTABLE SUSPENDER FOR ELECTRICAL DEVICES.** AUSTIN BERRY, Ottawa, Canada. Filed July 11, 1905. Serial No. 269,257.



Claim.—1. In an adjustable suspending device for electrical devices the combination with a hollow grooved reel constructed of non-conducting material and having a plurality of ratchet-shaped teeth formed in the periphery of the flange of the groove, of conducting-plates secured thereto, a central non-conducting core, pintles extending in each end thereof, means for non-rotatably supporting said pintles, conducting-cords wound on said reel and connected individually to said side plates, means for affording electrical connection between said side plates and a suitable source of power and a gravity-operated dog adapted to cooperate with said ratchet-teeth as and for the purpose specified.

2. In an adjustable suspending device for electrical devices the combination with the base and canopy having a central opening at the bottom thereof, a hollow reel constructed of non-conducting material, conducting side plates secured thereto a central non-conducting core, pintles secured thereto, brackets non-rotatably supporting said pintles and cross-beams resting on said canopy and supporting said brackets, suspending conducting-cords wound on said reel and connected individually to said side plates and means for affording electrical connection between said side plates and a suitable source of power as and for the purpose specified.

808,895. **ROPE.** CHARLES H. BILLMAN, Boston, Mass. Filed Mar. 27, 1905. Serial No. 252,205.

Claim.—1. A rope comprising a wire cable served with a fibrous material wound thereon substantially at right angles to the axis of said cable, and a plurality of strands of fibrous material laid or twisted together over the same.

2. A rope comprising a core consisting of a cable composed of a plurality of strands twisted together, a fibrous material served thereon throughout its length by winding the same substantially at right angles to the axis of said core, and a plurality of strands of fibrous material laid or twisted together thereover.

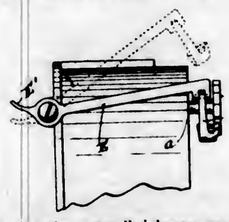
3. A rope comprising a core consisting of a cable composed of a plurality of strands of fine wires twisted together, a fibrous material wound thereon throughout its length and substantially at right angles to the axis of said core, and a plurality of strands of fibrous material laid or twisted together thereover.

4. A rope comprising a core consisting of a cable composed of a plurality of strands of fine wire twisted together, a plurality of strands of fibrous material laid or twisted together thereover, and means for preventing contact between the wire strands and the outer fibrous strands.

5. A rope comprising a core consisting of a cable composed of a plurality of strands of fine wires twisted together, a plurality of strands of fibrous material laid or twisted together thereover, and a flexible non-metallic covering interposed between the wire strands and the outer fibrous strands.

6. A rope comprising a core consisting of a plurality of strands of fine wires twisted together, a service thereon of hempen yarns wound around said wire strands substantially at right angles to said core, and a plurality of strands of yarn laid or twisted together thereon each strand being practically equal to the area of said inner cable.

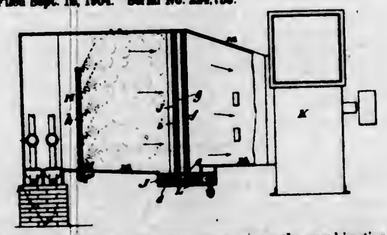
808,896. **TIME-CONTROLLED DAMPER.** SILAS B. BROWN, Cincinnati, Ohio. Filed Jan. 30, 1905. Serial No. 243,263.



Claim.—1. In a time-controlled damper mechanism, a clock, a lever lighter at one end than the other, a trigger on the lighter end of the lever adapted to support a weight, a clock-controlled ratchet-wheel on the rear of the casing under the heavier end of the lever adapted to be held normally against rotation and to be periodically released, and a pawl pivotally suspended from the heavier end of said lever adapted to automatically drop into engagement with the teeth of said ratchet-wheel after the releasing operation, substantially as described.

2. In a time-controlled damper mechanism, a clock, a shaft extended through the casing, clock-actuated mechanism within the casing adapted to lock said shaft normally against rotation and to periodically release the same, a lever, a damper-controller adapted to be suspended on the lighter end of the lever, and devices on the heavier end of the lever and upon said shaft adapted to be automatically engaged after each releasing operation, substantially as specified.

808,897. **APPARATUS FOR TREATING AIR.** WILLIS H. CARRIER, Buffalo, N. Y., assignor to Buffalo Forge Company, Buffalo, N. Y. Filed Sept. 16, 1904. Serial No. 224,756.



Claim.—1. In an air-purifying apparatus, the combination of an air-conduit and a separator therein comprising upright plates, each having a succession of oblique faces forming a continuous sinuous surface lengthwise of the conduit and having the front portion of such surface unobstructed to permit the distribution of the liquid along the plate from one face to another, and having its succeeding portion provided with projections which obstruct the flow of the liquid lengthwise of the conduit and promote the separation of the liquid from the air, the plates being spaced from each other to form continuous sinuous air-passages between them, substantially as set forth.

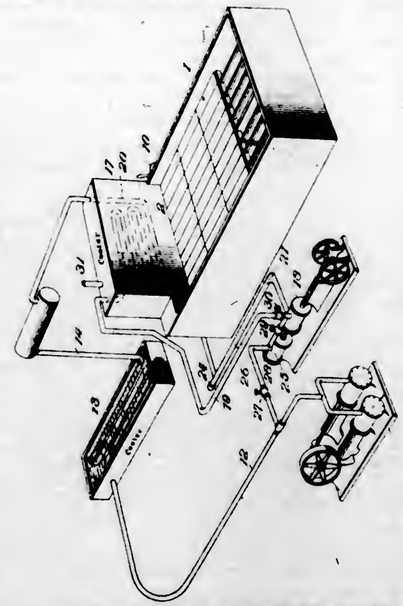
2. In an air-purifying apparatus, the combination of means for moistening the air, an air-conduit, and a separator therein comprising spaced upright plates having upright bends providing each plate with a succession of oblique faces and forming continuous sinuous air-passages between the plates, the surface of the front portions of said plates being smooth and unobstructed, and the succeeding portions of said plates having surface projections which obstruct the flow of the liquid lengthwise of the conduit, substantially as set forth.

3. In an air-purifying apparatus, the combination of means for moistening the air, an air-conduit, and a separator in said conduit comprising spaced upright plates having upright bends whereby the plates form continuous sinuous air-passages between them, a portion of the bends of each plate being provided with projecting flanges forming upright gutters, substantially as set forth.

4. In an air-purifying apparatus, the combination of means for moistening the air, an air-conduit, and a separator in said conduit composed of spaced upright plates having continuous zigzag surfaces and having projections forming gutters at salient portions of said surfaces, substantially as set forth.

5. A separator-plate for air-purifiers having separate sections arranged at an angle to each other, with the front portion of the rear section projecting beyond the rear portion of the adjacent front section, thereby forming a gutter at the junction of the sections, substantially as set forth.

808,898. **ICE-MACHINE.** ROBERT S. CATES, Kingman, Kans. Filed Nov. 10, 1904. Serial No. 232,074.

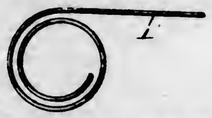


Claim.—1. In an ice-machine, the combination of a refrigerating-vat, a cooling-chamber at one end thereof in communication therewith, vertical partitions subdividing the lower portion of the cooling-chamber to form a tortuous path therein, a horizontal partition closing the upper ends of the vertical spaces forming the said tortuous path and having a vertical outlet, a coil arranged in the upper portion of the cooling-chamber, means for circulating compressed air through said coil, a perforated pipe connected with the said coil and arranged within said tortuous path for injecting cold air into the cooling-chamber for reducing the refrigerating solution to the proper temperature for freezing and to insure circulation of said solution through the vat and cooling-chamber, and an inclined deflector arranged above the perforated pipe for confining the air and insuring its commingling with the solution.

2. In an ice-machine, the combination of a refrigerating-vat, an air-compressor, a cooler, an engine operated by expansion of the cooled compressed air, means for injecting the expanded air into the

solution of the refrigerating-vat, an auxiliary air-compressor operated by means of the said engine, a valved pipe 26 connecting the auxiliary compressor with the air-pipe leading from the primary air-compressor, valved pipe 26 between the auxiliary air-compressor and its operating-engine, whereby compressed warm air may be admitted to the air-expansion engine to remove obstructing ice therefrom, substantially as specified.

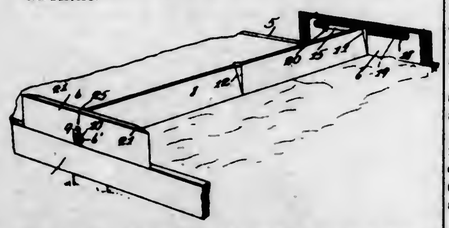
808,899. METHOD OF MANUFACTURING SPECTACLE-FRAMES. WALTER A. CRAPO, Southbridge, Mass., assignor to American Optical Company, Southbridge, Mass., a Corporation of Massachusetts. Filed May 8, 1905. Serial No. 259,906.



Claim.—1. An improved method of making wire frames for spectacles, &c., which consists in grooving the wire for the edge of the lens, with a varying depth of groove of predetermined length, soldering the nose-bridge and the temple attaching-lugs to the wire at its lens grooved portion, shaping the wire into a lens-frame, and deepening the groove in the wire where it is soldered to the nose-bridge.

2. An improved method of making wire frames for spectacles, &c., which consists in grooving the wire for the edge of the lens, with a varying depth of groove of predetermined length, soldering the nose-bridge and the temple attaching-lugs to the wire at its lens grooved portion, shaping the wire into a lens-frame, and deepening the groove in the wire where it is soldered to the nose-bridge, and where it is soldered to the temple attaching-lugs.

808,900. TOOL FOR MAKING ARTIFICIAL-STONE WALKS. PATRICK F. CONNELLY, Sioux Falls, S. D. Filed Mar. 10, 1905. Serial No. 249,498.



Claim.—1. In a device of the class described, a pair of runners, and a straight-edge pivotally supported between said runners and having its pivotal axis adjustable vertically with respect thereto.

2. In a device of the class described, a pair of runners, a straight-edge pivotally supported between said runners and having its pivotal axis adjustable vertically with respect thereto, and means for locking the straight-edge in adjusted position.

3. In a device of the class described, a pair of runners, and a combined straight-edge and marker pivotally supported between said runners.

4. In a device of the class described, a pair of runners, a straight edge pivotally supported between said runners, and marking-ribs carried by the straight-edge.

5. In a device of the class described, a pair of runners, and a straight-edge pivotally supported between said runners and having its side walls converging and provided with marking-ribs.

6. In a device of the class described, a pair of runners, and a straight-edge pivotally supported between said runners and provided with terminal and intermediate marking-ribs.

7. In a device of the class described, a pair of runners, and a straight-edge having converging side walls provided with terminal and intermediate marking-ribs gradually decreasing in height toward the base of said straight-edge.

8. In a device of the class described, a pair of runners each provided with a longitudinal slot, a straight-edge pivotally supported between said runners, and links pivoted to the opposite ends of the straight-edge and slidably mounted in said slots.

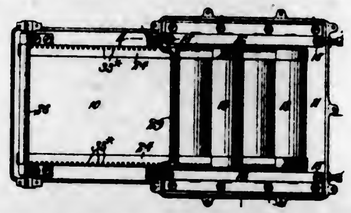
9. In a device of the class described, a pair of runners provided with alined recesses, a reversible straight-edge provided with terminal trunnions adapted to engage said recesses for pivotally supporting the straight-edge between said runners, and means for locking the straight-edge in reversed position.

10. In a device of the class described, a pair of runners each provided with a longitudinal slot, a reversible straight-edge pivotally supported between said runners, links pivoted to the opposite ends of the straight-edge, and clamping-bolts engaging the links and longitudinal slots for locking said straight-edge in reversed position.

11. In a device of the class described, a pair of runners, a combined straight-edge and marker pivotally supported between said runners and adjustable vertically with respect to the latter, and means for locking the straight-edge in adjusted position.

12. In a device of the class described, a pair of runners provided with a plurality of recesses or pockets, a straight-edge pivotally supported between said runners and adjustable vertically with respect to the latter, and a spring locking-clip carried by the straight-edge and adapted to engage the recesses in the runners for locking the former in adjusted position.

808,901. APPARATUS FOR RENDERING DRAWINGS AND DOCUMENTS TRANSPARENT AND WATERPROOF. CHARLES L. CRABB, New York, N. Y. Filed Apr. 6, 1905. Serial No. 254,171.



Claim.—1. In an apparatus for treating drawings and documents, the combination of a bath, a heating-chamber and calendering-rollers therein, and a sheet-carrier for passing sheets through said bath and thence through said chamber and between said rollers.

2. In an apparatus for treating drawings and documents, the combination of a bath, a heating-chamber and calendering-rollers therein, and endless bands which serve the two purposes of carrying sheets through said bath and chamber in contact with said rollers and driving said rollers.

3. In a calendering-chamber, the combination with calendering-rollers and journal-boxes therefor, of slides containing the several journal-boxes, springs within said slides between said boxes and screws screwing through said slides for the adjustment of said boxes and the rollers therein.

4. In an apparatus for treating sheets of paper or other material, the combination of a bath, a heating-chamber and calendering-rollers therein, a sheet-carrier composed of endless bands in lapping pairs running through said bath and chamber and on said rollers, and a separating-spreader applied between the bands of each pair.

5. In an apparatus for treating sheets of paper or other material, the combination of a bath, a heating-chamber and calendering-rollers therein, a sheet-carrier composed of endless bands in lapping pairs running through said bath and chamber and on said rollers, a spreader applied between the bands of said carrier, a spring-actuated tension-roller applied to said carrier, a slide carrying said tension-roller, and gearing between said slide and the spreader for simultaneously adjusting said roller and the spreader.

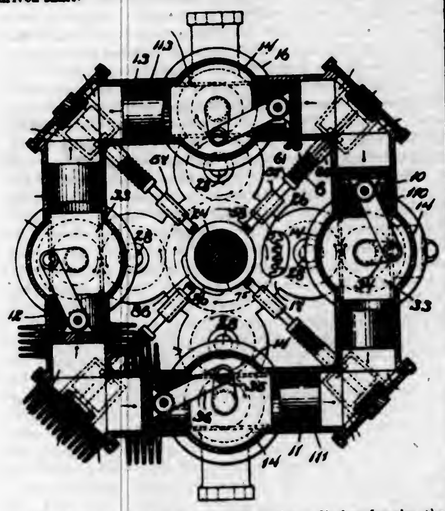
808,902. GAS-ENGINE. NEWTON CRANE, Boston, Mass., assignor to Newton Crane Gas Engine Company, Boston, Mass., a Corporation of Maine. Filed May 23, 1903. Serial No. 158,490.

Claim.—1. An engine comprising communicating cylinders forming the sides of a polygon, and double-acting pistons in said cylinders.

2. An engine comprising communicating cylinders forming the sides of a polygon, double-acting pistons in said cylinders, and connections whereby each pair of adjacent pistons move in opposite directions.

3. An engine comprising communicating cylinders forming the sides of a polygon, double-acting pistons in said cylinders, and a driven shaft operatively connected to all of said pistons.

4. An engine comprising communicating cylinders forming the sides of a polygon, each end of each cylinder forming with the end of the adjacent cylinder a combustion-chamber, double-acting pistons in said cylinders, a driven shaft, crank-shafts connected to said pistons, and operative connections between said crank-shafts and said driven shaft.



5. An engine comprising communicating cylinders forming the sides of a polygon, double-acting pistons in said cylinders, means whereby the pistons of each adjacent pair of cylinders operate in opposite directions, and means whereby combustible fluid is consumed in the meeting ends of said cylinders in a predetermined order.

6. An engine comprising communicating cylinders forming the sides of a polygon, double-acting pistons in said cylinders, a shaft located in the center of the polygon, and means connecting said pistons with said shaft.

7. An engine comprising communicating cylinders arranged in the form of a hollow polygon, each cylinder having an enlarged chamber between its ends, crank-shafts extending into said chambers, pistons in said cylinders connected to said crank-shafts, and a driven member connected to all of said crank-shafts.

8. A motor comprising a series of communicating cylinders forming the sides of a polygon, double-acting pistons in said cylinders, and means for successively effecting explosions in the chambers formed by all the meeting ends of said cylinders.

9. A motor comprising a series of communicating cylinders forming the sides of a polygon, double-acting pistons in said cylinders, means for successively effecting explosions in the chambers formed by the meeting ends of said cylinders, and a common driven member operatively connected to each of said pistons, independently of the others.

10. A motor comprising a series of cylinders forming the sides of a polygon with those cylinders which form the corners of the polygon communicating, double-acting pistons in said cylinders, a common conduit for supplying explosives mixture to the chambers formed by the meeting ends of said cylinders, and a common exhaust-conduit leading from said chambers.

11. A motor comprising four cylinders arranged in the form of a square, double-acting pistons in said cylinders, connections by which the pistons of each pair of adjacent cylinders move in opposite directions, and valve mechanism by which the explosions take place in the four corners of the square in succession.

12. A motor comprising an even number of cylinders arranged to form the sides of a polygon, pistons in said cylinders arranged whereby the pistons in each adjacent pair of cylinders move in opposite directions, a driven shaft, speed-reducing connections between said pistons and said shaft, and means whereby the explosions effect the simultaneous movement of the pistons in each pair of cylinders, successively, so that during each rotation of the shaft, it receives a series of impulses equal in number to the cylinders.

13. A motor comprising communicating cylinders arranged to form the sides of a square, there being an explosion-chamber at each angle of the square, a driven shaft in the center of the square, pistons in said cylinders geared to the shaft, and valve mechanisms including cams on said shaft and valve-rods radiating from the shaft toward the angles of the square.

14. A motor comprising cylinders arranged to form the sides of a square, each cylinder having a chamber intermediate of its ends, a crank-shaft extending into each chamber, plates closing the sides of said chambers, and a frame connecting said cylinders.

15. A motor comprising cylinders arranged to form the sides of a square, double-acting pistons in said cylinders, heads or plates closing the meeting ends of said cylinders, means connecting said cylinders, and heat-dissipating means on said cylinders and heads.

16. A motor comprising two communicating cylinders arranged at an angle to form a chamber between their meeting ends, and a valve-chamber on each side of said first-mentioned chamber and communicating therewith.

17. A two-part motor comprising a plurality of sets of cylinders, each set having the cylinders arranged to form the sides of a polygon, double-acting pistons in said cylinders, and a driven shaft operatively connected to all of said pistons.

18. A two-part motor comprising a plurality of sets of cylinders, each set having the cylinders arranged to form the sides of a polygon, pistons in said cylinders, a series of crank-shafts, each crank-shaft being connected to a piston in each set of cylinders and being located midway between the ends of a cylinder, and a driven shaft connected to all of said crank-shafts.

19. A two-part motor comprising a plurality of sets of cylinders, each set having the cylinders arranged to form the sides of a polygon, double-acting pistons in said cylinders, a series of crank-shafts, each crank-shaft being connected to a piston in each set of cylinders, a driven shaft connected to all of said crank-shafts, and means whereby the explosions occur alternately in said sets of cylinders and successively in the cylinders of each set.

20. A motor comprising a driven shaft, a series of cylinders arranged tangentially to a circle circumscribed about said shaft, each cylinder having an explosion-chamber at each end and a series of double-acting pistons in said cylinders operatively connected to said shaft.

21. A motor comprising a driven shaft, a series of cylinders arranged tangentially to a circle circumscribed about said shaft, a series of pistons in said cylinders operatively connected to said shaft, said adjacent pistons moving in opposite directions, valves for supplying fluid and exhausting the products of combustion from the meeting ends of said cylinders successively, and cams on said shaft for actuating said valves, said cams being arranged in sets and being movable whereby the explosions follow each other in one direction or the other around the shaft to cause the rotation of the shaft in one direction or the other.

22. A motor comprising a driven shaft, a series of cylinders arranged tangentially to a circle circumscribed about said shaft, a series of pistons in said cylinders operatively connected to said shaft, said adjacent pistons moving in opposite directions, valves for supplying fluid and exhausting the products of combustion from the meeting ends of said cylinders successively, cams on said shaft for actuating said valves, said cams being arranged in sets and being movable whereby the explosions follow each other in one direction or the other around the shaft to cause the rotation of the shaft in one direction or the other, and manually-operated means for moving said cams on said shaft.

23. A two-part motor comprising two complemental frames, each having a series of cylinders secured thereto to form the sides of a polygon, pistons in said cylinders, a driven shaft journaled in said frames, crank-shafts journaled in said frames, and each having cranks on both its ends connected to pistons, a gear on the driven shaft, gears on the crank-shafts, and gears supported on the frames and connecting the gear on the driven shaft with the gears on the crank-shaft.

24. An engine comprising a plurality of cylinders, each cylinder communicating at its ends with two adjacent cylinders to form combustion-chambers, double-acting pistons in said cylinders, and a shaft connected to all of said pistons.

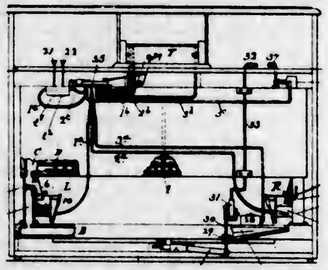
25. An engine comprising a plurality of cylinders, each cylinder communicating at its ends with two adjacent cylinders to form combustion-chambers, double-acting pistons in said cylinders, a series of crank-shafts each located in a line midway between the ends of a cylinder, and a shaft connected to all of said crank-shafts.

26. In internal-combustion engines having a plurality of combustion-chambers and cylinders, the arrangement of cylinders and combustion-chambers in which each cylinder is double-ended, the two ends forming parts of two separate chambers in which different

phases of the Otto cycle are simultaneously taking place, the double cylinders and the combustion-chambers being arranged in a continuous series, so that adjacent ends of adjacent double cylinders are in communication with a common combustion-chamber, substantially as described.

27. In internal-combustion engines having a plurality of combustion-chambers and double cylinders arranged in a continuous series as herein described, the arrangement of the cylinder-pistons in which they are rigidly connected in pairs and each pair coupled to a separate crank, so that the two adjacent ends of adjacent pairs of pistons are performing one phase of the Otto cycle and simultaneously at their opposite ends performing the preceding or the consecutive phase of the same cycle, substantially as described.

808,903. AUTOPNEUMATIC MUSICAL INSTRUMENT. WALTER CHIPPER, New York, N. Y., assignor to Wheox & White Company, Meriden, Conn., a Corporation of Connecticut. Filed June 5, 1905. Serial No. 263,710.



Claim.—1. In an autopneumatic music-playing instrument, the combination with the windway-passage for the air that effects movement of the action-playing pneumatics, said action-playing pneumatics, and a wind-inducing mechanism therefor; of an automatic air-pressure regulator or choker-pneumatic in connection with and forming a by pass to said windway, and having ports opening from and into the windway-trunk, the regulator-valve controlling one of said ports, a normally closed cut-off valve in said windway, intermedial to the regulator-ports, the valve-operating pneumatic and its primary controlling-pneumatics communicating with said windway between the regulator and wind-inducing means and having connection for operating said cut-off valve, and means operating as described for governing said primary and valve-operating pneumatics.

2. In combination, with the tracker, music-sheet, action-playing pneumatics, the wind-chest therefor, exhaust-chamber, and wind-inducing mechanism; the automatic regulator-pneumatic in connection with the windway-trunk between said wind-chest and the exhaust-chamber, said regulator having two ports into said trunk, and a regulator-valve for regulating the air-tension on said action-playing pneumatics, a port and stop-valve in the windway between said regulator-ports, for permitting passage of air to neutralize or modify the regulated air-tension, a pneumatic connected for operating said stop-valve, a tracker-duct pipe controlling said valve-operating pneumatic, the switch-valve in said pipe, the auxiliary air-inlet pipe unitable therewith at said switch-valve, and a finger-depressible entry-valve for said air-inlet.

3. The combination substantially as described, of the tracker, the treble and bass expression-regulators with controlling-pneumatics, the switch-valve seat with triple-arranged ports, tracker-duct pipes from the tracker to said valve-seat, conduit-pipes from the valve-seat to the respective expression-controlling pneumatics, ducts from said valve-seat to external air-inlets, the resiliently-acting inlet-valves closing said inlets, the finger-buttons for individually manually manipulating said inlet-valves, and a sliding switch-valve covering said valve-seat and adapted for uniting the respective pneumatic conduit-pipes with either the tracker-duct pipes or the inlet-valve ducts, in the manner as set forth.

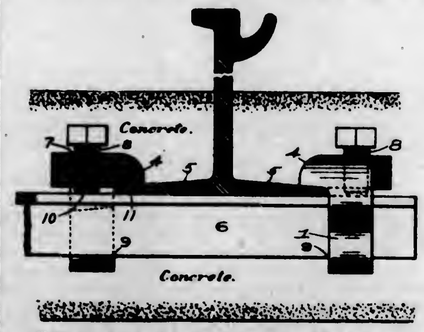
4. In an autopneumatic music-playing instrument, the combination, of the pedal-depressing member 24, the pedal-actuating lever 23 fulcrumed on the frame and its rear end connected for moving said member, the pivotally-supported angle-lever 31, the cranked upright rocker-shaft 33 having a handle for manually moving said angle-lever, the lifter-rod 30 connecting the fore end of the pedal-actuating lever with one arm of said angle-lever, a pneumatic mechanism comprising primary and power pneumatics arranged in connection with the exhaust-chamber, the movable member of its power-pneumatic provided with means for unattached engagement with the lifter-rod, adjustable lugs or nuts arranged on said lifter-rod respectively above said angle-lever and said pneumatic member, the tracker-duct pipe for flushing the primary pneumatic of said mechanism, and means for governing the admittance of air thereinto, all substantially as and for the purposes set forth.

5. In an autopneumatic music-playing instrument, in combination substantially as described, with the series of action-playing pneumatics, the tracker and tracker-ducts leading thereto, the wind-chest for said pneumatics, and the vacuum-chamber communicating with air-exhausting bellows; a break or partition dividing said wind-chest, windway-trunks that directly connect the respective wind-chest divisions with said vacuum-chamber, a normally closed stop-valve in each of the windways, the automatic regulator-pneumatics arranged upon the windway-trunks between said wind-chest and vacuum-chamber, and having ports thereinto above and below said stop-valve, the regulator-valve coacting with one of said parts, expanding tension-springs for the regulator-pneumatics, a pneumatic-box united with the windway below the regulator and carrying primary and power pneumatics, said power-pneumatics connected for operating the stop-valves, flush-pipes for the respective primary pneumatics and means of the character shown for governing the inflow of air thereto, for the purposes set forth.

6. In an autopneumatic music-playing instrument, the combination substantially as described with the tracker-duct pipe, the pedal-actuating lever, primary and power pneumatics connected for moving said pedal-actuating lever, the flushing-pipe 3^{c} for controlling said pneumatics, and an air-inlet pipe or duct 3^{a} communicatable therewith; of the spring-closed piston-disk forming an entry-valve for said air-inlet, and the laterally-swinging cranked handle-lever 37 arranged through the run-board and having an offset that acts against the piston-stem for opening said entry-valve in the manner set forth.

7. In an instrument of the class specified, in combination as described, with the action wind-chest and casing, windways for treble and bass sections, with accentuation means at R and L, comprising a plurality of pneumatic pressure-regulators for choking the windways, and pneumatics controlling said pressure-regulators, and the pedal-controlling pneumatic, the flush-pipes 1^{c}, 2^{c} and 3^{c} severally pertaining to said pneumatics, and the tracker having two supplemental accent-ducts at one end and a forwardly-enlarged supplemental pedal-duct at its other end, the tracker-duct pipes 1^{b}, 2^{b} and 3^{b}, the air-inlet pipes 1^{a}, 2^{a} and 3^{a}, the switch-valve seat arranged upon the action-casing and having an end of each of said pipes exposed therein in triple order, the switch-valve sliding upon said seat, valve-pistons stopping said air-inlet pipes, springs 8 that normally close said valve-pistons, and pressure-buttons on the piston-stems for depressing the pistons to open the air-inlets, all arranged and operating as set forth.

808,904. COMBINATION RAIL AND TIE FASTENER. FRANCIS M. CROSSLEY, Dayton, Ohio. Filed Sept. 21, 1905. Serial No. 279,383.



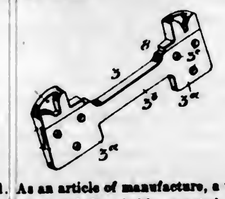
Claim.—1. In a rail-fastener for uniting rails to cross-ties, a clamp having a suitable opening for the tie, a lip projecting from said clamp and embracing the upper surface of the rail-flange, and a screw penetrating the top of said clamp and engaging the upper side of the rail, and effecting three points of contact when the device is rigidly secured in position.

2. A clamp for fastening rails to metallic ties consisting of a member having an opening therein to receive the tie, the lower surface of said opening being of tapering form, a lip projecting from one side of said member and engaging the rail-flange, and a screw penetrating the upper end of said clamp and engaging the tie.

3. In a fastener for rails, a clamp having a suitable opening to receive the tie, a screw passing through the upper portion of said clamp in alinement with the center of the tie-opening, a lip extending on one side of said screw and adapted to project over the rail-flange, the lower surface of the tie-opening in said clamp being of tapering form to provide a bearing-point between the lower side of the tie and the bottom of the clamp which engages said tie at a point between the contact-point of the screw and the tie, and the contact-point of the clamp and the rail-flange.

4. A clamp for securing rails to metallic cross-ties, the same having a T-shaped opening to receive the rail, the lower surface of said opening being of tapering form to engage the bottom of the rail at one side of the clamp, a lip projecting laterally from the upper side of the clamp to engage the rail-flange above the point of contact between the bottom of the tie and the bottom of the clamp, and a screw passing through said clamp and engaging the upper surface of the tie at a point opposite the engagement between the clamp and the rail-flange.

808,905. WALK-OVER CAR-SEAT. SAMUEL M. CURWEN, Philadelphia, Pa., assignor to John A. Brill, Philadelphia, Pa. Filed May 16, 1904. Serial No. 208,121.



Claim.—1. As an article of manufacture, a wall-plate for seats and the like, provided with detachably-mounted socket-pieces.

2. As an article of manufacture, a wall-plate for seats and the like, provided with detachably-mounted socket-pieces which are mortised into said plate, so that the sockets will be in a position to receive extensions from the back when the plate is in use.

3. As an article of manufacture, a wall-plate for seats and the like having mortises of varying depth and socket-pieces fitting said mortises and adapted to receive portions of the back of the seat.

4. As an article of manufacture, a wall-plate for seats and the like provided with mortises, and socket-pieces with recesses formed at one side of their upper portions fitting said mortises.

5. As an article of manufacture, a wall-plate for seats and the like provided with mortises having two horizontal and an upright face, and socket-pieces having corresponding faces for engagement with the said mortises and a recess formed in one side of the upper face of the socket-pieces.

808,906. GRAIN-DOOR FOR CARS. MORTON G. DONEHEW, Russell township, Putnam county, Ind. Filed July 29, 1905. Serial No. 271,748.

Claim.—1. A grain-door including a door-body having at an end thereof an abutment attached movably thereto and provided with a joint-plate movable with the abutment and projectable beyond the adjacent end of the door-body forming an extensible part thereof.

2. A grain-door including a door-body having at an end thereof a joint-plate and an abutment movable together and provided with controlling means carried by the grain-door, a locking-pin carried by the abutment and movable therewith, and a dowel attached to the opposite end of the grain-door.

3. A grain-door including a door-body having at one side of an end thereof a movable joint-plate, an abutment at the opposite side of the door-body provided with a locking-pin projectable beyond the end of the door-body, connecting devices extending through the door-body and connecting the abutment with the joint-plate for the movement thereof, and operating means for moving the abutment.

4. A grain-door including a door-body having at one side of an end thereof a movable joint-plate, an abutment at the opposite side of the door-body connected to the joint-plate and movable therewith, a locking-pin carried by the abutment and projectable beyond the end of the door-body, a screw-head attached fixedly to the door-body, an operating-screw screwed into the screw-head and connected operatively to the abutment for the operation thereof, and a dowel carried by the opposite end of the door-body.

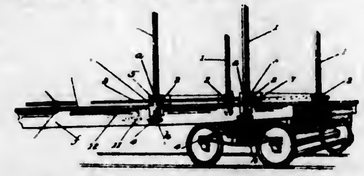
5. An expansible grain-door for cars including a door-body having at an end thereof a joint-plate and an abutment movable together and provided with controlling means carried by the grain-door, the joint-plate and the abutment being capable of engagement with a door-post of a car, and the opposite end of the door-body being adapted to engage an opposite door-post of the car.

6. An expansible grain-door for cars including a door-body having at an end thereof a joint-plate and an abutment movable together with respect to the door-body and provided with controlling means, the abutment having a locking-pin mounted thereon projectable beyond the end of the door-body simultaneously with the movement of the joint-plate, and the opposite end of the door-body having a projecting dowel.

7. A car including a body having a doorway between opposing door-posts, a car-door, a grain-door having an end for coöperation with a door-post and provided with a joint-plate and an abutment movable together at the opposite end of the grain-door, means for attaching the joint-plate and the abutment together and movably with respect to the grain-door body, and an operating device mounted on the grain-door and controlling the abutment.

8. In a car-body, the combination of a pair of opposing door-posts having each a socket therein, a grain-door having a dowel at an end thereof for entering one of the sockets and provided with a locking-pin for entering the other one of the sockets, an operating-screw for operating the locking-pin, and a joint-plate and an abutment connected together as movable parts of the grain-door and controlled by the locking-pin to and from one of the door-posts.

808,907. STANDARD. GEORGE W. DU BOIS, Kansas City, Mo. Filed Mar. 30, 1905. Serial No. 253,971.

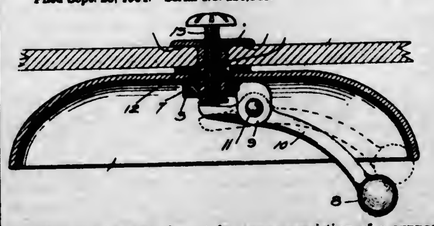


Claim.—1. The combination of the hinged standard provided with a hook, and the rod adjacent thereto and running parallel with the side of the car, and substantially as described.

2. The combination of the hinged standard provided with a hook, a casting provided with a slot, and a rod provided with a cut for engaging the hook, substantially as described.

3. The combination with a car-body, of standards pivoted on the sides of the same, hooks hinged to the standards and adapted to extend inward therefrom, a shaft arranged parallel to the adjacent side of the car-body and having portions with which the said hooks are attached for locking and releasing, and means for rotating and locking the said shaft, substantially as set forth.

808,908. GONG ATTACHMENT. JOHN T. DUFF, Pittsburg, Pa. Filed Sept. 28, 1904. Serial No. 228,345.



Claim.—1. An attachment for gongs consisting of a support adapted to pass through an opening in the supporting structure and provided on one end with a head or flange adapted to bear against said structure, said head being provided with prongs on its lower

face, a gong provided with an unthreaded opening passing over said support, a spacing washer or sleeve between said gong and the supporting structure, a collar secured to the end of said support and serving to clamp the gong and spacing member against the supporting structure, and a hammer and lever hinged to said collar.

2. An attachment for gongs consisting of a support adapted to pass through an opening in the supporting structure and provided on one end with a head or flange adapted to bear against said supporting structure and having its other end threaded, a gong provided with an unthreaded opening passing over said support, a spacing member between said gong and the supporting structure, a nut fitting on the threaded end of the support and serving to clamp the gong and spacing member against the supporting structure, and a hammer-lever hinged to said nut.

3. An attachment for gongs consisting of a hollow support adapted to pass through an opening in the supporting structure and provided on one end with a head or flange adapted to bear against said structure, a gong provided with an unthreaded opening passing over said support, a spacing member between said gong and supporting structure, a collar secured to the end of said support and serving to clamp the gong and spacing member against the supporting structure, a hammer-lever hinged to said collar, and operating means for said hammer passing through the opening in said support.

4. An attachment for foot-gongs comprising a hollow support adapted to pass through an opening in the supporting structure and provided on one end with a head or flange adapted to bear against said structure and having its opposite end threaded, a gong provided with an unthreaded opening passing over said support, a nut fitting on the threaded end of said support and serving to clamp the gong against the supporting structure, a hammer-lever hinged to said nut, and a pin having a sliding fit in the hollow support and arranged to contact with the hammer-lever.

5. An attachment for foot-gongs comprising a hollow bushing adapted to pass through the supporting structure and having a head or flange at its upper end bearing against said structure and having its lower end threaded, a gong provided with an unthreaded opening passing over said support, a spacing member between said gong and supporting structure, a nut fitting on the threaded end of said support and serving to clamp the gong and spacing member against the supporting structure, said nut being provided with ears, a hammer-lever hinged to said ears and having its end extending opposite the opening in the hollow support, and a pin having a sliding fit in said hollow support and arranged to contact with the end of said hammer-lever.

808,909. **INDEX-CARD.** JOSEPH S. DUNCAN and OLOF N. TEVANDER, Chicago, Ill., assignors to Addressograph Company, a Corporation of Illinois. Filed Feb. 13, 1905. Serial No. 245,402.

Claim.—1. The combination of a card provided with a projection extending beyond one edge thereof, and a detachable index-tab for the card adapted to form an interlocking engagement with said projection.

2. The combination of a card having an opening therein, a projection extending beyond an edge of the card, and a tab having a support and a foot, said foot being adapted to enter the opening in the card and said support being adapted to lie in front of the projection.

3. The combination of a card having an opening therein, a projection extending beyond an edge of the card, and a tab having a foot adapted to enter the opening in the card through the back thereof and an offset support adapted to lie in front of the projection.

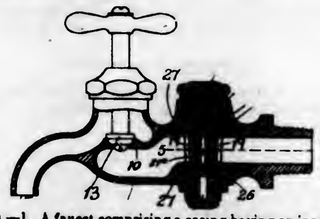
4. The combination of a card having an opening therein, a projection extending beyond an edge of the card, and a tab having an offset support and an offset foot, said foot being adapted to enter the opening in the card and said support being adapted to lie in front of the projection.

5. The combination of a card having an opening therein, a projection extending beyond an edge of the card, and a tab having a foot adapted to enter said opening, a support adapted to lie in front of said projection, and a lip arranged to engage a wall of said opening to lock the tab in place on the card.

6. The combination of a card having a projection thereon cut and stamped out of the card, said projection extending above the upper edge of the card, and a tab cut out to receive the projection and provided with a foot adapted to enter the opening in the card through the back thereof and a support adapted to lie in front of the projection and upon the upper edge of the card.

7. The combination of a card having an opening therein, a projection cut and stamped out of the card and extending above its upper edge, a tab cut out to receive the projection, an offset foot on the tab adapted to enter the opening in the card through the back thereof, and an offset support on the tab adapted to lie in front of the projection and above the upper edge of the card.

808,910. **FAUCET.** FRANK A. DUNHAM, Brockton, Mass. Filed Apr. 11, 1905. Serial No. 255,083.



Claim.—1. A faucet comprising a casing having an inner valve-seat adjacent to the inlet end, and an outer valve-seat adjacent to the outlet end, a valve controlling the outer valve-seat, and a rotary filter-holder formed as a valve seated on the inner valve-seat, and provided with a filter, and with ports which permit the passage of liquid through the filter, the holder being adapted to be adjusted to shut off the liquid from the valve.

2. A faucet comprising a casing having a valve, a socket intersecting the passage between the valve and the inlet end of the casing, a chambered filter-holder adapted to turn in said socket and provided with ports which permit the passage of liquid through the filter, one of the portions of the holder between the ports being closed to shut off the liquid from the valve, while the other portion of the holder between the ports is provided with an opening to permit the entrance of water into the filter for the purpose of cleaning the same, the holder having an outlet at one end and means for closing said outlet.

3. A faucet comprising a casing having a valve, an adjustable holder interposed between the valve and the inlet end of the casing and provided with a filter, and with ports which permit the passage of liquid through the filter, the holder being adapted to be adjusted to shut off the liquid from the valve, and washers surrounding the holder and interposed between the same and the adjacent portions of the casing above and below said ports.

4. An appliance of the character stated, comprising a casing having an inlet, an outlet, and an intermediate socket, a chambered filter-holder adapted to turn in the socket and provided with ports which permit the passage of liquid from the inlet to the outlet through the filter, one of the portions of the holder between the ports being closed to shut off liquid from the casing-outlet, while the other portion of the holder between the ports is provided with an opening to permit the entrance of liquid into the holder and filter, the holder having a waste-outlet extending through the casing, and means for closing the same.

5. An appliance of the character stated, comprising a casing having an inlet, an outlet, and an intermediate socket, a chambered filter-holder adapted to turn in the socket and provided with ports which permit the passage of liquid from the inlet to the outlet through the filter, one of the portions of the holder between the ports being closed to shut off liquid from the casing-outlet, while the other portion of the holder between the ports is provided with an opening to permit the entrance of liquid into the holder and filter, the holder having an opening for the reception of a filter, and a waste opening or outlet, and means for closing said openings.

808,911. **METHOD OF ANNEALING METAL.** WILLIAM R. HAMMER, Reading, Pa., assignor to Joseph T. Williams, Easton, Pa. Filed May 15, 1902. Serial No. 107,480.

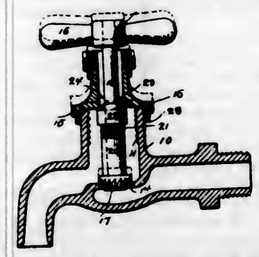
Claim.—1. The method of annealing metal which consists in introducing the metal into a molten bath containing a carbonate of an alkaline base, and a chlorid of an alkaline base, and free from a hardening agent, then removing the metal from the bath and slowly cooling it, as set forth.

2. The method of annealing metal, which consists in introducing metal into a molten bath containing a carbonate of an alkaline base and chlorids of two different alkaline bases, then removing the metal from the bath and slowly cooling it, as set forth.

3. The method of annealing metal, which consists in introducing the metal into a molten bath containing a carbonate of an alkaline base and chlorids of two different alkaline bases and free from a hardening agent, then removing the metal from the bath and slowly cooling it, as set forth.

4. The method of annealing metal, which consists in introducing the metal into a molten bath consisting of sodium chlorid, about three parts, and a carbonate of an alkaline base, about one part, then removing the metal from the bath and slowly cooling it, as set forth.

808,912. **DEVICE FOR REBEATING VALVES AND FAUCETS.** AUGUST EBBALEIN, Bridgeport, Conn. Filed Oct. 5, 1904. Serial No. 227,338.



Claim.—1. A device of the character described comprising a convex cutter a shank therefor and a bearing-piece which slides over the shank, and is tapered at its upper end for engagement with the opening in a valve or faucet cap whereby the cutter is made self-centering on the seat of a valve or faucet.

2. A device of the character described comprising a convex cutter, a shank therefor, a sleeve adapted to slide over the shank and rest upon the cutter, a bearing-piece adapted to slide over the shank and having a taper at its upper end to engage the opening in a valve or faucet cap and washers intermediate the sleeve and bearing-piece whereby the parts may be so adjusted that the cutter will engage centrally the opening in the valve-seat when the cap is in engagement with a valve or faucet body, and turning down of the cap upon the body will force the cutter downward upon the valve-seat as the operation proceeds.

3. A device of the character described comprising a convex rotary cutter, a shank by which it is carried, a bearing-piece adapted to engage the shank and having a taper to engage the cap centrally and means for retaining the bearing-piece in engagement with the cap when the cutter is in engagement with the valve-seat, so that by rotation of the cutter and turning down of the cap upon the body a new concave valve-seat will be formed.

4. A device of the character described comprising a convex cutter, a shank therefor, a sleeve adapted to slide over the shank and rest upon the cutter and a bearing-piece adapted to slide over the shank and having a taper at its upper end to engage the cap centrally and center the cutter upon the valve-seat.

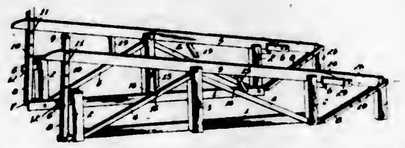
5. A device of the character described comprising a cutter, a shank therefor and a bearing-piece which slides over the shank, and is tapered at its upper end for engagement with the opening in a valve or faucet cap whereby the cutter is made self-centering on the seat of a valve or faucet.

6. A device of the character described comprising a self-centering cutter, a shank therefor, a sleeve adapted to slide over the shank and rest upon the cutter, a bearing-piece adapted to slide over the shank and having a taper at its upper end to engage the opening in the valve or faucet cap, and washers intermediate the sleeve and bearing-piece whereby the parts may be so adjusted that the cutter will engage centrally the opening in the valve-seat when the cap is in engagement with a valve or faucet body, and turning down of the cap upon the body will force the cutter downward upon the valve-seat as the operation proceeds.

7. A device of the character described comprising a self-centering rotary cutter, a shank by which it is carried, a bearing-piece adapted to engage the shank and having a taper to engage the cap centrally and means for retaining the bearing-piece in engagement with the cap when the cutter is in engagement with the valve-seat, so that by rotation of the cutter and turning down of the cap upon the body a new valve-seat will be formed.

8. A device of the character described comprising a self-centering cutter, a shank therefor, a sleeve adapted to slide over the shank and rest upon the cutter and a bearing-piece adapted to slide over the shank and having a taper at its upper end to engage the cap centrally and center the cutter upon the valve-seat.

808,913. **DEVICE FOR REMOVING OR REPLACING HAY-RACKS OR THE LIKE FROM OR TO THEIR RUNNING-GEAR.** GEORGE P. FINCH, Garneill, Mont., assignor of one-third to Alexander M. Hill and one-third to Walter H. Peck, Garneill, Mont. Filed Sept. 19, 1905. Serial No. 279,103.



Claim.—1. In a device of the class described, the combination with tilting tracks or ways, of supplemental skids or tracks for facilitating the unloading of racks or boxes from sleds or low wagons onto the main tracks or ways and the loading thereof from the tracks or ways onto the running-gear.

2. In a device of the class described, the combination with tilting tracks or ways and supporting members therefor adapted to be extended horizontally or engaged with the tilting tracks or ways, of supplemental skids or tracks adapted for engagement with the main tracks or ways and with the supporting members when the said supporting members are extended horizontally for facilitating the unloading of racks or boxes from sleds or low wagons onto the main tracks or ways and the loading thereof from the tracks or ways onto the running-gear.

3. In a device of the class described, the combination with tilting tracks or ways and supporting members therefor adapted to be extended horizontally or engaged with the tilting tracks or ways, of supplemental skids or tracks adapted for detachable engagement with the main tracks or ways and also engageable with the supporting members when the latter are extended substantially horizontally, said supplemental skids being adapted to facilitate the unloading of racks or boxes from sleds or low wagons onto the main tracks or ways and the loading thereof from the tracks or ways onto the running-gear.

4. In a device of the class described, the combination with tilting tracks or ways, of supplemental skids or tracks, said supplemental skids being supported at their lower ends and detachably connected at their upper ends to the main tracks or ways and being adapted for facilitating the unloading of racks or boxes from sleds or low wagons onto the main tracks or ways and the loading thereof from the tracks or ways onto the running-gear.

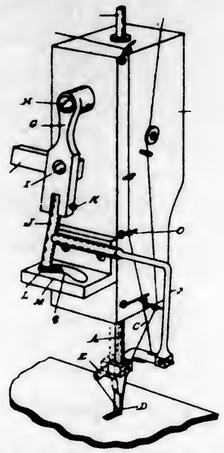
5. In a device of the class described, the combination with tilting tracks or ways, of a wagon running-gear, a box or rack detachably supported thereby, and a member hinged to the wagon box or rack and positioned in front of the bolster of the running-gear for the purpose set forth.

6. In a device of the class described, the combination with tilting tracks or ways, of a wagon running-gear, a cross-piece secured to the bottom of the box or rack, and a member hinged to the cross-piece and adapted to engage the bolster of the running-gear.

808,914. **BUTTONHOLE ATTACHMENT FOR SEWING-MACHINES.** FRANK J. FREMA, Detroit, Mich. Filed Dec. 27, 1904. Serial No. 238,378.

Claim.—1. In a buttonholing-machine, the combination with a reciprocatory needle-bar, of a thread-guide shiftable through a segmental path, to be alternately upon opposite sides of said needle-bar and mechanism for shifting said guide, comprising a vertically-arranged lever mounted on a stationary pivot, said lever having its lower end universally movable in a horizontal plane, a connection between the lower end of said lever and the thread-guide, means for

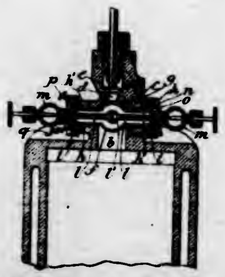
reciprocating said lever and means for guiding the lower end thereof in an angular course.



2. In a buttonholing-machine, the combination with a reciprocatory needle-bar, of a thread-guide shiftable through a segmental path, to be alternately upon opposite sides of said needle-bar and mechanism for shifting said guide comprising a vertically-arranged lever, formed in two sections, the lower section being pivoted to the upper section to swing in a plane transverse to the plane of movement of the lever as a whole, means for reciprocating said lever connected to the upper section thereof, a connection between the lower section of said lever and the thread-guide, and means for guiding the lower end of said lever through an angular course.

3. In a buttonholing-machine, the combination with a reciprocatory needle-bar, of a thread-guide shiftable through a segmental path, to be alternately upon opposite sides of said needle-bar and mechanism for shifting said guide, comprising the reciprocatory rod F, the lever G to which said rod is attached, the lower section J of said lever, pivoted to the upper section to swing in a transverse plane, the arm N connecting the section J with said thread-guide, the slotted guide-plate M and the antifriction-roll L on the section J for engaging the slot in said guide-plate.

808,915. **CARBURETER AND IGNITER FOR HYDROCARBON-ENGINES.** ARTHUR B. GOODSPEED, East Orange, N. J., assignor to Industrial Development Company, New York, N. Y., a Corporation of New York. Filed Mar. 10, 1904. Renewed June 9, 1905. Serial No. 264,531.



Claim.—1. An igniter for internal-combustion engines, &c., comprising a shell for external contact with the charge to be ignited and communicating internally with the external air and a carbureter and burner placed within said shell and comprising alined tubular members connected respectively with a hydrocarbon-supply and an air-supply and terminating centrally within said shell and means for spreading radially the burning gases, substantially as described.

2. An igniter for internal-combustion engines, &c., comprising a shell having a globular enlargement for external contact with the charge to be ignited and communicating internally with the external air, and a carbureter and burner placed within said shell and comprising alined tubular members connected respectively with a hydrocarbon-supply and an air-supply and terminating centrally within said globular enlargement and means for spreading radially the burning gases, substantially as described.

3. An igniter for internal-combustion engines, &c., comprising a shell for external contact with the charge to be ignited and communicating internally with the external air and a carbureter and burner placed within said shell and comprising tubular members connected respectively with a hydrocarbon-supply and an air-supply and terminating centrally and end to end within said shell whereby the burning gases are spread radially within the shell, substantially as described.

4. An igniter for internal-combustion engines, &c., comprising a shell having a globular enlargement for external contact with the charge to be ignited and communicating internally with the external air and a carbureter and burner placed within said shell and comprising alined tubular members connected respectively with a hydrocarbon-supply and an air-supply and terminating centrally and end to end within said globular enlargement whereby the burning gases are spread radially within said globular enlargement, substantially as described.

5. An igniter for internal-combustion engines, &c., comprising a shell for external contact with the charge to be ignited and communicating internally with the external air and a carbureter and burner placed within said shell and comprising alined tubular members connected respectively from opposite directions with a hydrocarbon-supply and an air-supply and enlarged and perforated at their opposing ends to form a burner-chamber centrally within said shell, substantially as described.

6. The combination with a cylinder of an internal-combustion engine having a chamber and an inlet for the charge, of an igniter comprising a shell having a globular enlargement located within said chamber to spread and ignite the charge admitted through said inlet and communicating internally with the external air and a carbureter and burner placed centrally within said shell and provided with means for spreading radially the burning gases, substantially as described.

7. The combination with a cylinder of an internal-combustion engine of an igniter comprising a shell subjected externally to the pressure within the cylinder and open for communication with the external air, and a hydrocarbon-burner within said shell, and means to regulate the escape of gases and the admission of air from and to the interior of said shell, substantially as described.

8. The combination with a cylinder of an internal-combustion engine having a chamber and an inlet for the charge, of an igniter comprising a shell having a globular enlargement located within said chamber to spread and ignite the charge admitted through said inlet, and communicating internally with the external air and a carbureter and burner placed centrally within said shell, substantially as described.

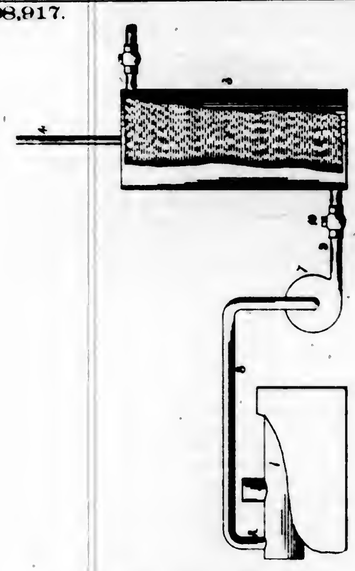
808,916. **DRAPER.** WALTER T. GORDON, Juniper, Oreg. Filed Apr. 12, 1905. Serial No. 255,344.

Claim.—In a draper or the like, the combination of a belt, a slat, and a slat-holder or clip comprising a base interposed between the slat and the belt and fixed with respect to the latter, and arms having inwardly-directed teeth on their edges throughout the length of the said edges; the said teeth being embedded in opposite sides of the slat.

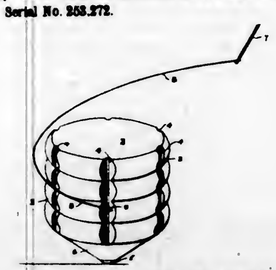
808,917. **SMOKE-CONSUMER.** JAMES R. GORMLEY, Chicago, and JOHN GORMLEY and PATRICK CORLEY, Rockford, Ill. Filed Aug. 16, 1904. Serial No. 220,963.

Claim.—A smoke-consumer comprising a closed tank, a water-supply to the tank, an overflow to the tank provided with a relief-valve, a blower, a pipe connection between the blower and tank, and provided with a check-valve, and a pipe connection between the blower and boiler or other coal-consuming apparatus.

808,917.



808,918. **TOP.** JOHN W. GRATTAN, Watertown, N. Y. Filed Apr. 1, 1905. Serial No. 253,272.



Claim.—1. A top of the class described, comprising a wooden body portion, a series of horizontal grooves or corrugations formed in the surface of said body, vertical grooves formed across the horizontal grooves and adapted to engage a knot on the end of a whip-lash, substantially as described.

2. A top of the class described, comprising a wooden body having one flat end and one cone-shaped end, a plurality of annular corrugations or grooves formed in the surface of said body, a plurality of grooves formed lengthwise of said body adapted to engage a knot or like part formed on the end of a whip-lash, substantially as described.

3. A top of the class described, comprising a cylindrical body having one flat, and one cone-shaped end, annular rings or corrugations formed around said body, and grooves formed lengthwise of said body adapted to provide a purchase or hold for a knot formed on the end of a whip-lash.

808,919. **RED AZO DYE AND PROCESS OF MAKING SAME.** JOHN HAGENBACH, Basle, Switzerland, assignor to Aniline Colour and Extract Works, formerly John R. Geigy, Basle, Switzerland. Filed June 20, 1905. Serial No. 267,676. (Specimens.)

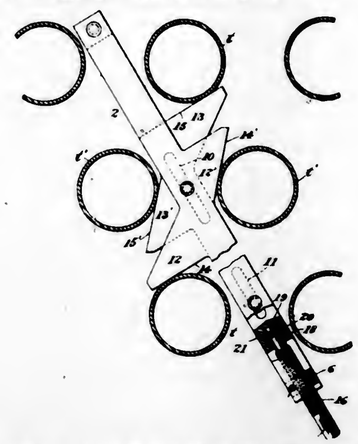
Claim.—1. The process for producing red azo dyestuffs by combining the diazo derivatives of ortho amidonaphthol sulfonic acids with 1-phenyl-5-pyrazolones capable to combine in position four, substantially as set forth.

2. The process for producing a red azo dyestuff by combining the diazo derivative of 1-amido-2-naphthol-4-sulfonic acid with 1-phenyl-3-methyl-5-pyrazolone substantially as set forth.

3. The herein-described new azo dyestuffs produced by combining the diazo derivatives of ortho amidonaphthol sulfonic acids with 1-phenyl-5-pyrazolones capable to combine in position four, forming dark-brown powders with slight metallic luster, soluble in water with an orange-yellow to reddish-brown color, turning into yellowish red to bluish red by addition of acetic acid, soluble in concentrated sulfuric acid with a bright orange to red color and yielding on wool from acid-bath yellowish-brown to violet-brown shades, changing into yellowish red to bluish red when treated after dyeing with chromium compounds substantially as set forth.

4. The herein-described new azo dyestuffs produced by combining the diazo derivative from 1-amido-2-naphthol-4-sulfonic acid with 1-phenyl-3-methyl-5-pyrazolone, forming a dark-brown shiny powder, soluble in water with an orange-yellow color, turning into a brilliant red by addition of acetic acid, soluble in concentrated sulfuric acid with magenta color and yielding on wool from acid-bath reddish-brown-yellow shades changing into crimson-red when treated after dyeing with chromium compounds substantially as set forth.

808,920. **TOOL FOR SPREADING THE TUBES OF WATER-TUBE BOILERS.** PATRICK HEELY and JOHN KERR, New York, N. Y. Filed July 7, 1905. Serial No. 268,723.



Claim.—1. A tool for spreading the tubes of water-tube boilers, embodying a carrier, a pair of tube-spreading members for spreading a plurality of tubes relatively to one another, and means for moving said tube-spreading members toward and from each other.

2. A tool for spreading the tubes of water-tube boilers, embodying a carrier, a pair of tube-spreading members for spreading a plurality of tubes relatively to one another, said tube-spreading members having parallel working faces, and means for moving said tube-spreading members toward and from each other and maintaining said working faces in parallelism.

3. A tool for spreading the tubes of water-tube boilers, embodying a carrier, a pair of tube-spreading members for spreading a plurality of tubes relatively to one another, and means for moving said tube-spreading members toward and from each other and for holding them in any position to which they may be shifted.

4. A tool for spreading the tubes of water-tube boilers, embodying a two-part carrier the two parts of which are adjustable relatively to each other, and a pair of tube-spreading members for spreading a plurality of tubes relatively to one another, said tube-spreading members being secured respectively to the two parts of the carrier.

5. A tool for spreading the tubes of water-tube boilers, embodying a two-part carrier the two parts of which are connected by screw-threads and are adjustable thereby relatively to each other, and a pair of tube-spreading members for spreading a plurality of tubes relatively to one another, said tube-spreading members being secured respectively to the two parts of the carrier and movable toward and from each other.

6. A tool for spreading the tubes of water-tube boilers, embodying a two-part carrier the two parts of which are connected by screw-threads and are adjustable thereby relatively to each other, and a pair of tube-spreading members for spreading a plurality of tubes relatively to one another, said tube-spreading members being secured

respectively to the two parts of the carrier and movable toward and from each other and having parallel working faces.

7. A tool for spreading the tubes of water-tube boilers, embodying a two-part carrier forming a rod one part of which constitutes a guide and the other part a slide movable along said guide, means for adjusting said slide on said guide and for holding it in its adjusted position, and a pair of tube-spreading members secured respectively to the two parts of the carrier.

8. A tool for spreading the tubes of water-tube boilers, embodying a two-part carrier forming a rod one part of which constitutes a guide and the other part a slide movable along said guide, means for adjusting said slide on said guide and for holding it in its adjusted position, and a pair of tube-spreading members secured respectively to the two parts of the carrier and having working faces extending in parallelism and at an acute angle to the axis of the carrier.

9. A tool for spreading the tubes of water-tube boilers, embodying a carrier having more than two tube-spreading members, and means for moving said tube-spreading members away from and toward each other to spread and release more than two tubes.

10. A tool for spreading the tubes of water-tube boilers, embodying a carrier, two pairs of tube-spreading members, and means for moving the members of one pair away from and toward each other in one direction and for moving the members of the other pair away from and toward each other in a direction transverse thereto to spread and release two pairs of tubes.

11. A tool for spreading the tubes of water-tube boilers, embodying a carrier, two pairs of tube-spreading members the working faces of each pair being parallel, and means for moving the members of one pair away from and toward each other in one direction and for moving the members of the other pair away from and toward each other in a direction transverse thereto to spread and release two pairs of tubes.

12. A tool for spreading the tubes of water-tube boilers, embodying a rod-like carrier, two pairs of tube-spreading members the working faces of each pair being parallel and the working faces of one pair being disposed at an acute angle to the axis of the carrier, and means for moving the members of one pair away from and toward each other in the direction of the length of the carrier and for moving the members of the other pair away from and toward each other in a direction transverse thereto to spread and release two pairs of tubes.

13. A tool for spreading the tubes of water-tube boilers, embodying a two-part carrier the two parts of which are adjustable relatively to each other, and two pairs of tube-spreading members one member of each pair being secured to one part of the carrier and the other member of each pair being secured to the other part of the carrier and the working faces of members of different pairs being disposed at different angles.

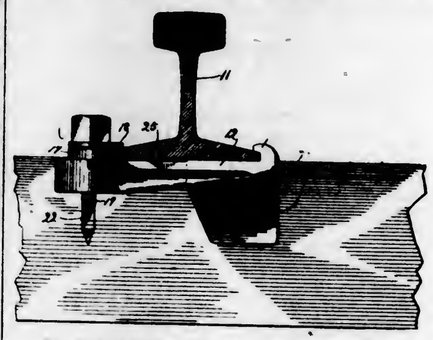
14. A tool for spreading the tubes of water-tube boilers, embodying a two-part carrier the two parts of which are adjustable relatively to each other, and two pairs of tube-spreading members one member of each pair being secured to one part of the carrier and the other member of each pair being secured to the other part of the carrier and the working faces of members of different pairs being disposed substantially at a right angle to the carrier and the members of the other pair having parallel working faces disposed substantially at an acute angle to the carrier.

15. A tool for spreading the tubes of water-tube boilers, embodying a two-part carrier the two parts of which are connected by screw-threads and are adjustable thereby relatively to each other, two pairs of tube-spreading members one member of each pair being secured to one part of the carrier and the other member of each pair being secured to the other part of the carrier and the working faces of members of different pairs being disposed at different angles.

16. A tool for spreading the tubes of water-tube boilers, embodying a two-part carrier one part of which has a fixed nut and the other part of which is slidable along the first, an adjusting-screw working in said nut of the first part of the carrier and swiveled to the other part of said carrier, and a pair of tube-spreading members secured respectively to the two parts of the carrier and movable toward and from each other.

17. A tool for spreading the tubes of water-tube boilers, embodying a two-part carrier one part of which has a fixed nut and the other part of which is slidable along the first, an adjusting-screw working in said nut of the first part of the carrier and swiveled to the other part of said carrier, and two pairs of tube-spreading members one member of each pair being secured to one part of the carrier and the other member of each pair being secured to the other part of the carrier and the working faces of members of different pairs being disposed at different angles.

808,921. RAILWAY-RAIL STAY. THOMAS D. HENDERSON, Chicago, Ill. Filed May 8, 1905. Serial No. 259,265.



Claim.—1. A railway-stay comprising in combination, a body having a rail-flange-engaging hook at one end and a flange-gripping device at the opposite end; a shank projecting laterally from the hooked end of the bar; and a flange depending from the outer end of the shank, the face of the flange being inclined toward the remote end of the body of the stay.

2. In a railway-rail stay, in combination, a body having a rail-flange-engaging hook at one end and a transverse aperture at the opposite end; and a plug rotatably seated in the aperture and having a cam-rib for engaging the edge of the rail-flange.

3. In a railway-rail stay, in combination, a body having a rail-flange-engaging hook at one end and a transverse aperture at the opposite end; and a plug rotatably seated in the aperture and having a cam-rib for engaging the edge of the rail-flange, a key-seat being formed in the aperture-wall and the body of the plug.

4. In a railway-rail stay, in combination, a body having a flange-engaging hook at one end and a transverse aperture at the other end; a plug rotatably seated in the aperture and having a lateral foot engaging the under face of the body, and a top flange having its lower face beveled for engaging the top of the flange.

808,922. PIPE-COUPLING. AUSTIN T. HERRICK, Bradford, Pa. Filed Sept. 15, 1904. Serial No. 224,521.

Claim.—1. In a pipe-coupling, the combination of the sleeve and the collar, each having a bore to fit the outer circumference of a pipe, one of said parts being provided with a packing-receiving bore, and a packing fitting in said bore and provided with a V-shaped annular groove; the other part being provided with an annular projection, the outer end of which is larger than the base of the groove in the packing to cause an extreme compression on the inner and outer faces of the packing adjacent the base of the groove.

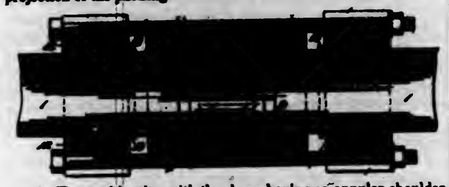
2. The combination with the sleeve and the collar, each having a bore fitting the outer circumference of the pipe, one of said parts having an enlarged packing-receiving bore, of a packing for said bore, having a V-shaped groove; the other of said parts having an annular projection with parallel inner and outer walls and its edge wider than the base of the V-shaped groove.

3. In a pipe-coupling, a packing-ring provided with a V-shaped groove extending from the top to a point near the bottom and having an enlargement at the bottom.

4. In a pipe-coupling, the combination with the sleeve having an enlarged bore; of a packing-ring adapted for insertion in said enlarged bore and provided with an annular V-shaped groove having an enlargement at its bottom; and a collar provided with an annular flange having an annular enlargement, and adapted to enter the annular groove of the packing-ring.

808,923. PIPE-COUPLING. AUSTIN T. HERRICK, Bradford, Pa. Filed Sept. 15, 1904. Serial No. 224,522.

Claim.—1. The combination with a sleeve having an interior annular projection having seats at its ends, of pipes fitted within the ends of the sleeves having greater diameters than the bore of the annular projection, packings adapted to receive the ends of the pipes and surround the same and having annular projections fitting between the seat and the end of the pipe, and means separable from the pipe for gripping the pipes and forcing them against the annular projection of the packing.



2. The combination with the sleeve having an annular shoulder therein, of a packing adapted to receive the end of a pipe of greater diameter than the bore of the annular shoulder, and having an annular projection adapted to extend between the shoulder and the end of the pipe, and means separable from the pipe adapted to grip a pipe and force it against the projecting portion of the packing.

3. In a pipe-coupling, a sleeve having a central bore enlarged at each end, a square seat and a wedge-shaped groove formed at the juncture of the central and enlarged bores.

4. In a pipe-coupling, the combination with a sleeve having a square seat and a wedge-shaped groove formed in its interior, of a packing-ring comprising an annular rectangular projection and beveled portions extending each side of the projection, said ring adapted to fit within said sleeve.

5. In a pipe-coupling, a packing-ring comprising a rectangular portion and wedge-shaped portions of different lengths extending from each side of the rectangular portion the outer faces of the wedge-shaped portions being in alinement.

6. In a pipe-coupling, the combination with a sleeve having a central and enlarged end portions, square seats and wedge-shaped grooves formed at the juncture of said bores, packing-rings each having a central rectangular portion and wedge-shaped portions of different length extending from each side of the rectangular portion, the shorter of the beveled portions being adapted to be seated in the wedge-shaped groove formed within the sleeve, of collars having a tapering bore and slips adapted to fit within said tapering bore and provided with wickers upon their inner faces.

7. The combination with the sleeve, of an annular shoulder or seat therein, provided with an annular groove, and a packing adapted to receive the end of a pipe and surround the same, having a portion adapted to enter the annular groove, and an annular portion adapted to extend between the end of the pipe and the seat or shoulder.

8. The combination with the sleeve having an annular shoulder therein; of a packing abutting against the shoulder and having a tapering pipe-receiving bore to receive the end of a pipe, and an annular projection at the smaller end of the bore; and means for forcing the pipe in the packing.

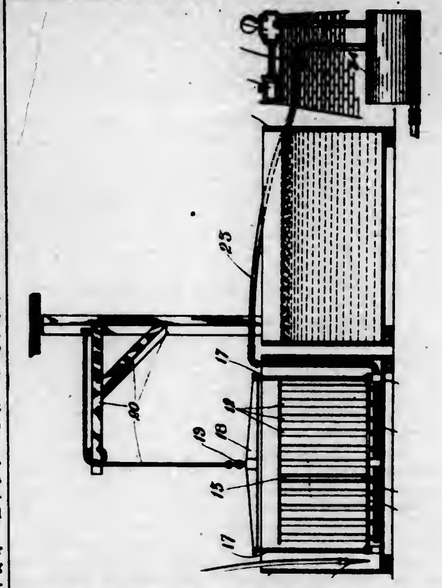
9. In a pipe-coupling, the combination with a member having a cylindrical bore; of a packing having a cylindrical portion to fit the bore of said member, a tapering bore, and a shoulder at the smaller end of the bore; a second member adapted to fit within the tapering bore of the packing and abut against the shoulder; and means for forcing the second member within the tapering bore of the packing to cause the packing to be pressed against the cylindrical bore of the first member.

808,924. FILTERING SYSTEM. HENRY L. HOLLIS, Chicago, Ill. Filed July 2, 1904. Serial No. 214,600.

Claim.—1. In a system of exhaust filtration, the combination with a receptacle containing the material to be filtered, of a filter-chamber in said receptacle, a pervious cloth adjacent to the outer surface of the filter-wall, and means for detachably securing said pervious cloth in place.

2. In a system of filtration, the combination with a filter-chamber, a detachable pervious screen adjacent to the surface of a filter-wall of said chamber, means for supplying material to be filtered to one side of the wall of said chamber, and means for reducing the pressure upon the other side of said wall.

3. In a system of filtration, the combination with a filter-chamber, a detachable pervious screen adjacent to the surface of a filter-wall of said chamber, means for supplying material to be filtered to one side of the wall of said chamber, and means for withdrawing fluid from said filter-chamber.



4. In a system of exhaust filtration, the combination with a suitable receptacle containing the material to be filtered, of a filter-chamber in said receptacle, a detachable pervious screen adjacent to the outer surface of a filter-wall of said chamber, means for withdrawing the fluid from the interior of said filter-chamber, and means for removing said filter-chamber from the receptacle.

5. In a system of exhaust filtration, the combination with a suitable receptacle containing the material to be filtered, of a filter-chamber in said receptacle, a detachable pervious screen adjacent to the outer surface of a filter-wall of said chamber, means for withdrawing the fluid from the interior of said filter-chamber, means for removing said filter-chamber from the receptacle, and means for agitating the material within said receptacle.

6. In a system of filtration, the combination with a receptacle containing the material to be filtered, a filter proper in said receptacle, a detachable screen adjacent to a filter-wall of said filter, a pump for producing a suction to cause the passage of fluid successively through said screen and said filter-wall, means for collecting the filtered fluid, a second receptacle containing water for washing purposes, and means for moving said filter proper from one receptacle to the other.

7. In a system of filtration, the combination with a suitable filter proper, of a detachable screen adjacent to a filter-wall of said filter, and means for causing a difference in pressure on the two sides of said filter-wall.

8. In a system of filtration, the combination with a suitable filter proper, of a detachable screen adjacent to a filter-wall of said filter, and means for causing a decrease in the pressure on the opposite side of the filter-wall from that upon which the detachable screen is placed.

9. In a filtering system, the combination with a filter-wall, of a detachable screen covering the outer surface of the filter-wall, and means for reducing the pressure on the inner side of the filter-wall.

10. In a system of exhaust filtration, the combination with a receptacle containing the material to be filtered, of a second receptacle containing water for washing purposes, a filter proper comprising a plurality of filter-chambers each having suitable canvas filter-walls, a detachable gauze-like cloth adjacent to the outer surface of each of said filter-walls, means for holding said cloths in place during the filtering operation, means for withdrawing air and fluid from the interior of said filter-walls, and means for transferring said filter proper from one receptacle to the other and for removing it from both, whereupon said gauze-like cloths may be changed, substantially as described.

11. In a system of exhaust filtration, the combination with a receptacle containing the material to be filtered, of a filter proper comprising a plurality of filter-chambers each having suitable canvas filter-walls, a detachable gauze-like screen adjacent to the outer surface of each of said filter-walls, means for holding said cloths in place during the filtering operation and prior to immersion in the material to be filtered, and means for creating suction within the filter-chambers.

12. In a system of exhaust filtration, the combination with a receptacle containing the material to be filtered, of a second receptacle containing water for washing purposes, a filter proper comprising a plurality of filter-chambers each having suitable filter-walls, a detachable gauze-like cloth adjacent to the outer surface of each of said filter-walls, means for holding said cloths in place during the filtering operation, means for withdrawing air and fluid from the interior of said filter-walls, and means for transferring said filter proper from one receptacle to the other and for removing it from both, whereupon said gauze-like cloths may be changed, substantially as described.

13. In a system of exhaust filtration, the combination with a receptacle containing the material to be filtered, of a filter proper comprising a plurality of filter-chambers each having suitable filter-walls, a detachable gauze-like screen adjacent to the outer surface of each of said filter-walls, means for holding said cloths in place during the filtering operation and prior to immersion in the material to be filtered, and means for creating suction within the filter-chambers.

14. In a system of exhaust filtration, the combination with a receptacle containing the material to be filtered, of a second receptacle containing water for washing purposes, a filter proper comprising a plurality of filter-chambers each having suitable filter-walls, a detachable gauze-like screen adjacent to the outer surface of each filter-wall, a reservoir, a flexible tube connecting said reservoir with the chambers of said filter proper, a pump for exhausting the air from said reservoir, and means for transferring said filter proper from one receptacle to the other and for removing it from both, whereupon said gauze-like screens may be renewed.

15. In a filtering system, the combination with a tank containing the material to be filtered, of a filtering medium, means for alternately introducing said medium into and removing the same from said tank, means for drawing the contained material through said filtering medium while in the tank, and a screen outside of the filtering medium for removing the solid material from said filtering medium, while said medium is outside the tank.

16. In a filtering system, the combination with a tank for containing the material to be filtered and a water-tank, of a filter, means for introducing and removing the same into and from each of said tanks alternately, and means for drawing the contents of said tanks through the filtering medium into detachable cloth provided with fine meshes external to said filtering medium for removing the solid material from said filtering medium.

17. In a filter, the combination with a filtering medium, of a pipe extending into said medium, a pump connected therewith for intermittently producing a drawing action, and a fine-meshed detachable screen for removing the solid material from said filtering medium, substantially as described.

18. In a filtering system, the combination with a tank for containing the material to be filtered and a tank for containing a cleansing liquid; of a filter, means for introducing and removing the same into and from the first-mentioned tank and for introducing and removing same into and from the second-mentioned tank, means for drawing the material contained in the first-mentioned tank through the filtering medium while the filter is within the tank and for drawing the liquid from the second-mentioned tank through the filter while therein, and a detachable screen for removing the solid material from the filter.

19. In a filtering system, the combination with a suitable filtering medium, of a tube communicating with the interior thereof, a pump for producing an intermittent drawing action within said tube, and a detachable cloth adjacent to the filtering medium to entangle and engage the solid material and for removing the same from the surface of the filtering medium.

20. In a filtering system, the combination with a tank for containing the material to be filtered and a cleansing-fluid tank, of a filter, means for introducing and removing the same into and from said tanks alternately, means for drawing the contents of said tanks through said filter, and a fine-meshed screen for removing foreign substances from the surface of said filter after its removal from the tank containing the cleansing fluid.

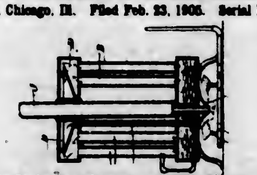
21. In a filter, the combination with a suitable receptacle for the material to be filtered, of a filter proper, means for introducing the same into and removing the same from said receptacle, means for producing a drawing action through said filter while in the receptacle, and a detachable fine-meshed screen outside of the filter through which the fluid must pass before reaching the filtering medium, means for removing said screen with the solid material engaged thereby, and a second screen for substitution in place of that removed.

22. In a filtering system, the combination with a suitable tank for containing the material to be filtered, of a filter comprising a plurality of plates, filtering means carried thereby, a tube communicating with the interior of said filtering means, means for introducing and removing said filter proper into and from said tank, means for drawing the material contained in said tank through said filtering medium and through said tube, and a bodily-removable cleansing-screen outside of said filtering means through which the fluid must be drawn in passing from the tank through said filtering means.

23. In a system of filtration, the combination with a receptacle containing the material to be filtered, of a filter-chamber in said receptacle having pervious stationary side walls, means for creating suction in said filter-chamber, additional pervious side walls for said filter-chamber, and hooks from which said additional walls may be suspended and from which said walls may be readily detached to remove therefrom the accumulated material after filtration.

24. In a system of exhaust filtration, the combination with a receptacle containing the solution to be filtered, of a filter-chamber in said receptacle, said filter-chamber consisting of a frame to the sides of which are permanently secured walls of pervious material, hooks extending from the sides of said frame, and additional side walls of pervious material stretched between said hooks and readily detachable therefrom, whereby the material accummulated on said additional walls after filtration may be removed from the filter-chamber.

808,925. **INDEPENDENT STEAM-HEAT RADIATOR.** WILLIAM HOLSTEIN, Chicago, Ill. Filed Feb. 23, 1905. Serial No. 247,033.



Claim.—1. In independent steam-heat radiators the combination of two receptacles integrally connected by tubes and a funnel-shaped disk in the upper receptacle, a tube connected with said disk said tube extending down and entering said lower receptacle to a point near the bottom thereof, said lower receptacle supplied with water, a heating device placed under said lower receptacle, said lower receptacle supplied with a water-gage, an air-valve connected with one of the connecting-tubes, substantially as described.

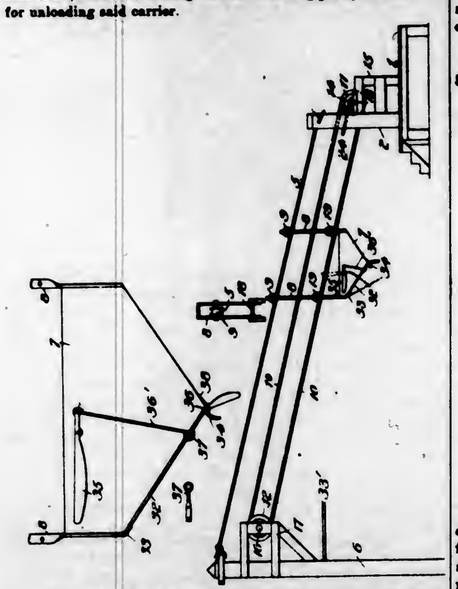
2. An independent steam-radiator comprising an upper receptacle and a lower receptacle joined by tubes, the upper receptacle containing a funnel-shaped disk, a condensation-tube connecting the said disk with the lower receptacle, the lower receptacle adapted to contain water, a heater below the lower receptacle, and a flue for the heater, substantially as described.

808,926. **WOOD-CONVEYER.** GEORGE G. HUSH, Fort Worth, Tex. Filed Oct. 11, 1905. Serial No. 282,936.

Claim.—1. A wood-conveyor comprising a traveling conveyer-box, a trolley-cable having one end elevated above the other, hangers attached to said box and provided with pulley-wheels engaging said cable, a driving-cable attached to said hangers, gearing for driving said driving-cable, said hangers having pulley-wheels engaging said cable, said box having an inclined hinged bottom piece, weighted latches for holding said bottom piece in place, a tripping device in the path of said latches, and weighted levers for bringing said hinged bottom piece back to its normal position.

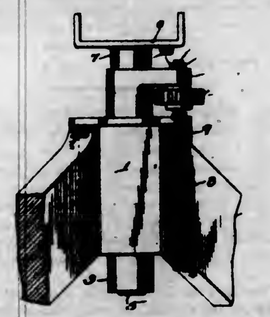
2. A wood-conveyor comprising a traveling carrier, an inclined track for said carrier, means for moving said carrier, said carrier having a bottom consisting of two inclined portions meeting at a line transverse to the movement of the carrier and one of said bottom portions being hinged, weighted latches attached to the other bottom portion for holding said hinged portion in its normal position, a tripping device in the path of said latches, and weighted levers fulcrumed on the side of said carrier and having pivotal connections with said hinged bottom portion.

3. A wood-conveyor comprising a traveling carrier, an inclined track for said carrier, hangers in two sections pivotally connected together and attached to said carrier and provided with pulleys engaging said track, a driving-cable attached to said hangers at the pivotal connections of said hangers, pulleys for said driving-cable, said hangers having pulleys engaging the lower traveling part of said cable, means for driving said cable-driving pulleys, and means for unloading said carrier.



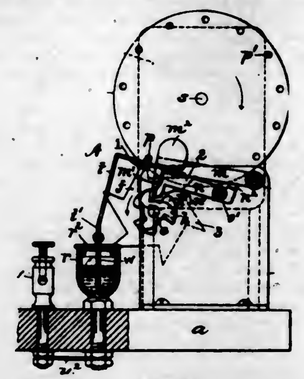
4. A wood-conveyor comprising a traveling carrier, an inclined track for said carrier consisting of a cable attached to a fixed object at one end, a spool at the other end thereof for regulating the tension thereof, means for rotating said spool, a ratchet-wheel and dog for holding said spool against rotation after suitable tension has been obtained, hangers in two sections pivotally connected together, the lower sections being attached to said carrier and the upper sections being provided with trolley-wheels engaging said track, a driving-cable attached to the pivotal connections of said hangers, pulleys for mounting and driving said cable, shafts for said pulleys, one of said shafts being a driving-shaft, the pulley mounted on said driving-shaft having a clutch formed on the hub thereof, a sprocket-wheel having a cooperating clutch formed on the hub thereof and adapted to engage the clutch of said driving-pulley, means for throwing said sprocket-wheel in and out of mesh with said driving-pulley, means for unloading said carrier, and means for regulating the speed of said carrier when returning to its normal position.

808,927. **ADJUSTING-SCREW FOR REVOLVING CHAIRS.** HOWARD G. HUSH, New York, N. Y. Filed Apr. 4, 1905. Serial No. 253,861.



Claim.—An article of the class described comprising a leg-supporting head provided with a longitudinal smooth bore and a threaded offset, an internally and externally smooth sleeve engaging the orifice and having an arm constituting a bearing, an adjusting-screw in engagement with the threaded offset and having one end mounted for rotation in the arm, a stop secured to the upper end of the adjusting-screw and bearing upon the arm to hold the screw against disconnection therefrom, and an externally-smooth seat-supporting spindle mounted within the sleeve.

808,928. **MECHANICAL MOVEMENT.** ARTHUR W. HUTCHINS, Providence, R. I. Filed Dec. 29, 1904. Serial No. 238,708.



Claim.—1. In a device or mechanism of the class described, the combination with a revoluble star-wheel and lifting-cams and means for simultaneously actuating said wheel and cams intermittingly, of a pair of self-dropping coacting pawls having their normal movements controlled by said cams, and having one of the pawls arranged to be tilted upwardly by the action of the fellow pawl when the latter is depressed, as in dropping from its cam.

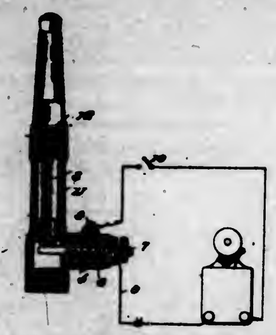
2. In a device or mechanism of the class described, the combination with a revoluble star-wheel, a pair of lifting-cams concurrently movable with said star-wheel and a continuously-movable disk or member provided with means for operating the wheel and cams in an intermittent manner, of a pair of self-dropping pawls normally actuated by and in substantially continuous engagement with said cams and with each other, one of the pawls when released from its cam acting to quickly elevate the other pawl, and a member or element secured to the last-named pawl whereby intermittent reciprocating movements are imparted to said member.

3. In a device or mechanism of the class described, the combination of a revoluble lifting-cam, a self-dropping or primary pawl in substantially continuous engagement therewith, a revoluble second cam, a secondary pawl adapted to engage the last-named cam and also in engagement with the primary pawl, a member connected with the secondary pawl by means of which member the movements of the latter pawl are utilized, and means for simultaneously imparting an intermittent rotary movement to the cams.

4. In a device or mechanism of the class described, a primary self-dropping swinging pawl m, a revoluble cam for elevating said pawl, a secondary self-dropping movement-transmitting pawl n arranged with respect to and in engagement with pawl m whereby the action of the latter in falling automatically elevates the other pawl, a revoluble check-cam for holding the last-named pawl in position while the primary pawl itself is moving upwardly, and means for simultaneously imparting an intermittent rotary movement to both the said pawl-lifting cams.

5. In a device or mechanism of the class described, the combination with a revoluble star-wheel and lifting-cams mounted and arranged to work in unison, of a continuously-revoluble disk provided with pins located in the path of the teeth of said star-wheel for engaging the latter and rotating it and said cams together in an intermittent manner, a pair of coacting self-dropping swinging pawls in engagement with and having their movements controlled by said cams, and having one of the pawls provided with a member or element through which the movements of the pawl are utilized, substantially as described.

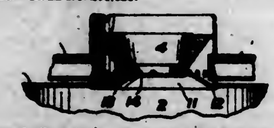
808,929. AUTOMATIC GAS RANGE-SIGNAL. FREDUS A. KNUDSEN, Cedar, Ohio. Filed May 31, 1904. Renewed June 6, 1905. Serial No. 264,815.



Claim.—1. In a pressure-alarm, the combination of a hollow body having a passage for the fluid or liquid, an electric alarm-circuit, a pin forming one terminal of said circuit and extending into the hollow body, a valve mounted to reciprocate within the hollow body and to close the aforesaid passage thereof and constituting in effect the other terminal of the alarm-circuit to close the same under abnormal conditions by coming in contact with the said pin, the latter also serving to support the valve and limit its downward movement and a spring for normally holding said valve in contact with the pin, substantially as set forth.

2. In a pressure-alarm, the combination of a hollow body having a passage for the fluid or liquid, an electric alarm-circuit, a pin forming one terminal of said circuit and extending into the hollow body, a valve mounted to reciprocate within the hollow body and to close the aforesaid passage thereof and constituting in effect the other terminal of the alarm-circuit to close the same under abnormal conditions by coming in contact with the said pin, a spring for normally holding said valve in contact with the pin, and a disk nut having screw-thread connections with the hollow body for regulating the tension of said spring and having an opening for reception of a tool and to provide an escape, substantially as set forth.

808,930. BURNER DEVICE FOR TUBULAR LANTERNS. DAVID C. KLINE, Rochester, N. Y., assignor to The Pritchard-Stong Company, Rochester, N. Y., a Corporation of New York. Filed July 21, 1905. Serial No. 270,033.



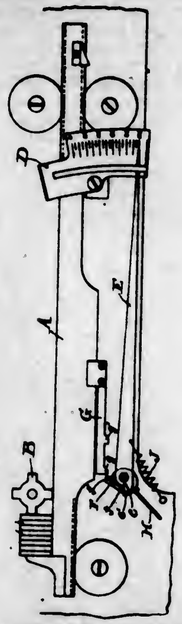
Claim.—1. In a burner device for tubular lanterns, a gallery-tube, an oil-pot having a central orifice within said gallery-tube, a burner-support having an orifice corresponding to said central orifice, a perforated diaphragm-plate having its outer edge fitting the gallery-tube and its inner edge registering with the oil-pot orifice, and means for holding said parts together.

2. In a burner device for tubular lanterns, a gallery-tube, an oil-pot having a central orifice within said gallery-tube, a burner-support having an orifice corresponding to said central orifice, a perforated diaphragm-plate having its outer edge fitting the gallery-tube and its inner edge registering with the oil-pot orifice, and a metal annulus in said orifices and compressed upon the adjacent edges of the oil-pot and of the burner-support.

808,931. ATTACHMENT FOR LINOTYPE-MACHINES. JOHN H. W. ELSOM, Philadelphia, Pa. Filed Oct. 1, 1903. Serial No. 175,722.

Claim.—1. In a linotype-machine, in combination, mechanism to assemble a line of matrices—a magnifying indicating-needle, and intermediate means, especially adapted to operate said indicating-needle.

2. In a linotype-machine, in combination, mechanism to assemble a line of matrices—a magnifying indicating-needle, one or more independent movable projections especially adapted with intermediate mechanism to operate upon said indicating-needle, and carried by said assembling mechanism.



3. In a linotype-machine, in combination, mechanism to assemble a line of matrices—a magnifying indicating-needle, a scale on which a small portion of an inch is divided into a number of enlarged equal parts, these parts being numbered, and these numbers corresponding to one or more space-matrices especially provided.

4. In a linotype-machine, in combination, mechanism to assemble a line of matrices, a magnifying indicator, a corresponding scale, a series of space-matrices, especially sized and numbered to correspond with said scale, and to be used in connection therewith.

5. In a linotype-machine, in combination with the assembler-slide, one or more independent movable frames having a projection thereon, especially adapted to act in combination with intermediate mechanism upon a magnifying indicator, a pivoted pawl especially adapted to act, when struck by said projection, upon said indicator, and operatively connected therewith, and means to move said pawl into and out of line of movement of said projection.

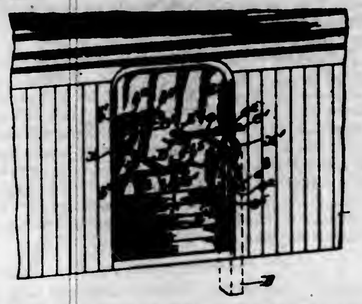
6. In a linotype-machine, in combination, a magnifying indicator, a corresponding scale, one or more independent movable frames having a projection carried by said assembler-slide, especially adapted to act upon a pivoted pawl especially provided to act upon said indicating-needle, and a rod adapted to move said pawl into and out of alinement with said movable projection.

7. In a linotype-machine, in combination, an enlarged scale, a magnifying indicator coacting with said scale, a pin on which said indicator is pivoted, a pawl on said pin, operative connection between said pawl and indicator, a rod mounted on said pin, a spring around said pin, connected to said rod and pawl, said rod being especially adapted to move said pawl out of and into alinement with said movable projection.

808,932. MAIL-TRANSFERRING DEVICE. CHARLES KEEPS, Chicago, Ill. Filed Mar. 23, 1905. Serial No. 251,559.

Claim.—1. In a mail catching and delivering device, arms engaged upon the sides of the car adjacent a door, transverse arms or bars at the outer ends thereof adapted to extend parallel with the car when swung outwardly, a forwardly-directed spring-yoke on one of said bars, rearwardly-directed means on each of the same adapted to support a mail-bag or the like in position to be engaged by a corresponding device adjacent the track and adapted to deliver a bag to said jaws.

2. In a device of the class described, complemental means supported on the car and adjacent the track, comprising respectively, upper and lower longitudinal bars for supporting a mail-bag or the like in vertical position and oppositely-directed yokes having resilient sides and each adapted to engage and receive the bag supported upon the other.



3. A device of the class described, a hinged arm adapted to be swung parallel with the car, a forwardly-directed spring-yoke pivoted horizontally on one end thereof, a rearwardly-directed support on the other end and a complemental device adapted to be supported adjacent the track, each of said devices acting to receive from and to deliver to the other a package, thereby affording an exchange.

4. A catching-yoke for the purpose specified comprising a bar adapted to be supported in engaging position, a transverse head at the end of said bar, an open annular spring projecting beyond the head and outwardly-curved jaws at the end of the said spring adapted to receive a mail-bag or the like between the same and a guard limiting the outward movement of the yoke arm or jaws.

5. In a device of the class described, a catching head comprising a bar, a transverse curved head thereon, oppositely-disposed leaf-springs pivoted on said bar and projecting slightly beyond the head and outwardly-curved jaws on the end of each spring acting to receive between the same, the articles to be engaged.

6. In a device of the class described, complemental members adapted to be engaged upon a car and upon a post adjacent a track and each adapted to support a mail-bag or the like in position to be engaged by the other, resilient engaging jaws carried on each in position to engage the mail-bag each upon the other centrally, whereby said devices are adapted to effect exchange of packages each with the other during the passage of a train and means limiting the spreading movement of said jaws.

7. In a device of the class described, the combination with upper and lower arms supported longitudinally of the car of a cross-head on one of said arms, a guide therein, a resilient yoke pivoted on said arm adjacent said head and projecting forwardly beneath said guide.

8. In a device of the class described the combination with a pair of longitudinal arms supported on a car and provided with rearwardly-directed reduced ends, a spring-clamp adapted to coact with said reduced ends to support a mail-bag in vertical position, a cross-head pivotally engaged at the opposite end of one of said arms and a resilient yoke on said arm and head adapted to receive a mail-bag from a similar device adjacent the track.

808,933. RUBBER HORSESHOE. ABRAM LANG, Bronx, N. Y. Filed Aug. 16, 1905. Serial No. 274,303.

Claim.—1. A horseshoe, comprising a rubber tread-plate provided with recesses, an anchor-rod embedded in said plate and extending across said recesses, a strap adapted to engage the horse's hoof, and connecting members attached at their upper ends to said strap and at their lower ends to the portions of the anchor-rod arranged in said recesses, substantially as set forth.

2. A horseshoe, comprising a rubber tread-plate provided in its edge with recesses, an anchor-rod embedded in the plate and extending across said recesses, an attaching-strap adapted to embrace the horse's hoof, and clips having their lower ends arranged in said recesses and pivoted to said anchor-rod and provided at their upper ends with loops through which said strap passes, substantially as set forth.

3. A horseshoe, comprising a rubber tread-plate, separate anchor-rods embedded in said plate and arranged along opposite sides thereof, said rods being provided at their front ends with transverse branches embedded in the toe portion of the plate, an attaching device adapted to engage the horse's hoof, and means for connecting said attaching device with said anchor-rods, substantially as set forth.

4. A horseshoe, comprising a rubber plate provided with recesses, an anchor-rod embedded therein and composed of a piece of wire doubled upon itself and extending across said recesses, an attaching device adapted to embrace the horse's hoof, and clips connected at one end to said attaching device and at their opposite ends to the portions of said anchor-rod arranged in said recesses, substantially as set forth.

5. A horseshoe, comprising a rubber plate provided with recesses, separate anchor-rods embedded lengthwise in said plate near opposite edges thereof and each composed of a piece of wire doubled upon itself and extending across said recesses, the free ends of said doubled wires being arranged transversely in the toe portion of the plate, an attaching-strap, and clips connecting said strap with the portions of the anchor-rods arranged in said recesses, substantially as set forth.

6. A horseshoe, comprising a rubber plate provided with recesses, an anchor-rod embedded therein and composed of a piece of wire doubled upon itself and extending across said recesses, a tie-rod extending lengthwise of the anchor-rod and engaging the end portions thereof, an attaching device adapted to embrace the horse's hoof, and clips connected at one end to said attaching device and at their opposite ends to the portions of said anchor-rod arranged in said recesses, substantially as set forth.

7. A horseshoe, comprising a rubber plate provided with recesses, separate anchor-rods embedded lengthwise in said plate near opposite edges thereof and each composed of a piece of wire doubled upon itself and extending across said recesses, a tie-rod arranged lengthwise between the members or branches of each anchor-rod and connecting the end portions thereof, an attaching-strap, and clips connecting said strap with the portions of the anchor-rods arranged in said recesses, substantially as set forth.

8. A horseshoe, comprising a rubber plate provided with recesses, separate anchor-rods embedded lengthwise in said plate near opposite edges thereof and each composed of a piece of wire doubled upon itself and extending across said recesses, a tie-rod arranged lengthwise between the members or branches of each anchor-rod and connecting the end portions thereof, a band surrounding the intermediate portions of the branches and the tie-rod of each anchor-rod, an attaching-strap, and clips connecting said strap with the portions of the anchor-rods arranged in said recesses, substantially as set forth.

808,934. BOTTLE-STOPPER. HENRY B. LABARRE, Chicago, Ill., assignor of one-half to Isaac A. Levinson, Chicago, Ill. Filed Sept. 5, 1905. Serial No. 277,600.

Claim.—1. In a bottle-stopper the combination of a cork piece, a disk thereon, and an additional piece formed up to obtain a top and a cylindrical wall, such cylindrical wall arranged to be forced inward into close contact with the neck of a bottle, and such top cut to obtain a thumb-piece, arranged to be bent into position to be seized and thereby a strip torn from the top and cylindrical wall-piece to release it from the bottle-neck, and such thumb-piece provided with a raised rib, tending to maintain the thumb-piece in the same plane as the remainder of the top; substantially as described.

2. The combination of a bottle-stopper and the neck of a bottle, the neck of the bottle provided with an annular rib and the bottle-stopper consisting of a cork piece, a disk thereon, and an additional

piece formed up to obtain a top and a cylindrical wall, such cylindrical wall arranged to be forced inward into close contact with the neck of the bottle and under the annular rib thereon and such top cut to obtain a thumb-piece, arranged to be bent into position to be seized and thereby a strip torn from the top and cylindrical wall of the additional piece to release it from the bottle-neck, and such thumb-piece provided with a raised rib tending to maintain the thumb-piece in the same plane as the remainder of the top; substantially as described.

808,935. HANDLE FOR DENTAL FLASKS. THEODORE G. LEWIS, Buffalo, N. Y., assignor to Buffalo Dental Manufacturing Company, Buffalo, N. Y., a Corporation of New York. Filed Aug. 26, 1905. Serial No. 275,570.

Claim.—1. A handle for a dental flask, comprising a body provided with means constructed to embrace the projecting upper end of a clamping-bolt of the flask and below said means with a member adapted to engage the side of the flask, substantially as set forth.

2. A handle for a dental flask provided with an eye or loop adapted to fit over one of the clamping-bolts of the flask and below the eye with arms or horns adapted to engage the side of the flask, substantially as set forth.

3. A handle for a dental flask, comprising a substantially horizontal body having a downwardly-curved front end, an eye or loop projecting forwardly from the curved portion of the handle and adapted to fit over one of the clamping-bolts of the flask, and a pair of horns projecting forwardly from said curved portion below the eye or loop and adapted to engage the side of the flask, substantially as set forth.

4. A handle for a dental flask, comprising a substantially horizontal body having a downwardly-curved front end, an eye or loop projecting forwardly from the curved portion of the handle and adapted to fit over one of the clamping-bolts of the flask, and a pair of diverging horns extending forwardly from said curved portion below the eye or loop and adapted to engage the side of the flask, substantially as set forth.

5. A handle for a dental flask, comprising a body having a downwardly-curved front portion provided at its end with a headed stud, a hub applied to said stud and carrying a pair of forwardly-extending horns, and an eye or loop projecting forwardly from the handle above said horns, substantially as set forth.

6. A handle for a dental flask, comprising a body having a downwardly-curved front portion provided at its end with a headed stud, a hub applied to said stud and provided with a pair of forwardly-extending horns and upwardly-projecting lips bearing against opposite sides of the handle, and an eye or loop projecting forwardly from the handle above said horns, substantially as set forth.

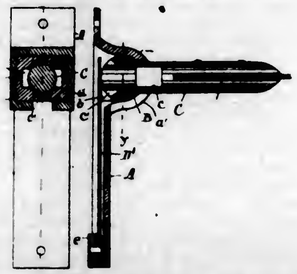
808,936. PHOTOGRAPHIC PLATE AND FILM LIFTER. JULES J. LEVY, Hoboken, N. J. Filed Sept. 20, 1904. Serial No. 224,430.

Claim.—1. The combination, with a pair of holding-jaws provided with a longitudinally-disposed groove in the inner edge of each, of a handle composed of two arms or rods bent with the inner end of each bent at an angle to the plane of the said handle and having one of such holding-jaws pivoted directly on each of them inner bent ends, whereby to be capable of a rotary movement around the same, substantially as described.

2. The combination, with a handle constructed of resilient material and having a loop in its outer end and with two arms or members disposed across each other, and the inner end portion of each bent at an angle to the plane of the said handle, of a holding-jaw pivoted directly upon the inner bent end of each of these arms or members, whereby to be capable of rotation around the same, and provided with a longitudinally-disposed groove in its inner edge, substantially as described.

3. The combination, with a handle constructed of resilient material and having a loop in its outer end with two arms or members crossing each other and bent at their inner ends at an angle to their respective body portions, and a holding-jaw pivoted directly upon the inner bent end of each of these arms or members whereby to be rotatable around the same, and provided with a longitudinally-disposed groove in its inner edge, of a supporting-plate adapted to be gripped and supported between such jaws and provided with means at its end or ends through which the finger of the operator may pass to raise the end of a film or paper supported upon such plate, substantially as described.

808,937. CAR-SIGNAL. ANDREW S. MACREADIE, South Portland, Me. Filed Mar. 27, 1905. Serial No. 252,116.



Claim.—1. In a car-signaling device the combination of a hollow casing, means for securing said casing to the car, a block held within said casing and adapted to turn therein, a rod pivoted in said block and a signal-target on the end of said rod.

2. In a car-signaling device, the combination of a hollow casing, a block secured within said casing and adapted to turn therein, a rod pivoted to said block, a spring adapted to press against the back of said block to prevent its rattling and a signal-target on the end of said rod.

3. In a car-signaling device, the combination of a hollow casing, having an opening in the rear and a block within said casing and adapted to turn therein, a rod pivoted in said block, a signal-target on the lower end of said rod, said casing having a horizontal opening in front large enough to allow said rod to turn and a smaller vertical slot extending downward from said opening, a portion of said rod being cut away to fit said slot and a flat spring acting against the back of said block to prevent its rattling.

4. In a car-signaling device, the combination of a hollow casing, having an opening in the rear and a block within said casing and adapted to turn therein, a rod pivoted in said block and adapted to be withdrawn therefrom, a signal-target on the lower end of said rod, said casing having a horizontal opening in front large enough to allow said rod to turn and a smaller vertical slot extending downward from said opening, a portion of said rod being cut away to fit said slot and a flat spring acting against the back of said block to prevent its rattling.

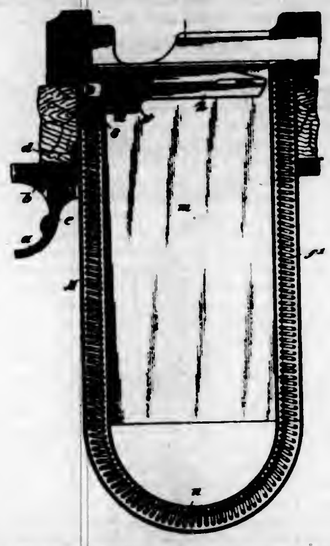
808,938. MAGAZINE FOR SMALL-ARMS. PAUL MAUSER, Oberndorf-on-the-Neckar, Germany. Filed July 28, 1903. Serial No. 167,543.

Claim.—1. In a magazine for firearms, a chamber for cartridges, and a spring for feeding the cartridges therein, extended in part around the exterior of said cartridge-chamber.

2. A magazine for firearms having a cartridge-chamber providing a substantially straight path for the cartridges, and a spring for feeding said cartridges extending in part around the lower portion of said chamber.

3. A magazine for firearms having a cartridge-chamber, and a spring for feeding the cartridges therein, said spring extending in part along an end of said chamber and exterior to the same, beyond the path of movement of the cartridges, and being curved at the lower part of said chamber.

4. A magazine for firearms having a chamber adapted to contain cartridges, and a spring for feeding said cartridges, arranged at the exterior of said chamber and extended around the lower part of said chamber and on both sides thereof.



5. A magazine for firearms, having a cartridge-chamber providing a substantially straight path for the cartridges, a guide extending at front and at rear of said path and around the bottom thereof, and a spring in said guide adapted to feed said cartridges toward the top of said chamber.

6. In a magazine for firearms, a casing, a feeder in said casing, a guide extending around the lower end of said casing, and on both sides thereof, and a spiral spring in said guide for moving said feeder.

7. A magazine for firearms, comprising a substantially flat casing having a cartridge-chamber extending from bottom to top thereof, a guide extending along the front and rear ends of said casing, and around the bottom thereof, a feeder for said cartridges adapted to move in said chamber, a spring having one end bearing against one end of said guide, and its other end bearing against said feeder to move the latter.

8. In a magazine for firearms, a casing, a feeder in said casing, a guide extending around the lower end of said casing in a semicircular direction, and on both sides of said casing, said guide on one side having a slot opening into the interior of said casing, a slide adapted to move in said guide, and connected to said feeder through said slot, and a spiral spring one end of which engages said slide, and the other end of which bears against a fixed part on the other side of said guide.

9. In a magazine for firearms, a casing, a slide, a spring for moving said slide, a feeder pivoted at its end to said slide, and means for preventing said feeder from swinging downwardly around its pivot.

10. In a magazine for firearms, a casing, a slide, a spring for moving said slide, a feeder pivoted to said slide, and means for yieldingly holding said feeder in an oblique position in said casing.

11. In a magazine for firearms, a casing, a slide, a spring for moving said slide, a feeder pivoted to said slide, and means for yieldingly holding said feeder in an oblique position in said casing comprising a spring acting against said slide.

12. In a magazine for firearms, a casing having a guide, a slide having rollers moving along said guide, a spring for moving said slide, and a feeder pivoted to said slide.

13. A magazine adapted to be attached to and detached from a firearm, said magazine having an opening in its upper part, through which the cartridges are fed to the breech of said firearm, a sliding lip adapted to extend over said opening to retain the cartridges in said magazine when the latter is detached from the firearm, means adapted to engage a portion of the firearm to move said lip out of such position when the magazine is attached to the firearm, and a separate spring for automatically returning said lip to its operative position when the magazine is detached from the firearm.

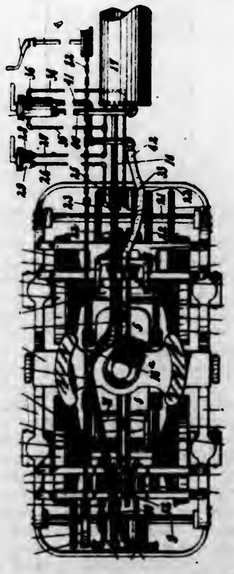
14. A magazine adapted to be attached to and detached from a firearm, said magazine having an opening in its upper part, through which the cartridges are fed to the breech of said firearm, a sliding lip adapted to extend over said opening to retain the cartridges in said magazine when the latter is detached from the firearm, said lip having means for engaging a portion of the firearm whereby the lip is moved out of position when the magazine is attached to the firearm, and a separate spring adapted to move said lip upwardly into its operative position when the magazine is detached.

15. A magazine adapted to be attached to and detached from a firearm, said magazine having an opening in its upper part, through which the cartridges are fed to the breech of said firearm, two sliding lips normally extending over said opening from opposite sides of the magazine, and separate springs for moving said lips upwardly to their operative positions when the magazine is detached.

16. A magazine adapted to be attached to and detached from a firearm, said magazine having an opening in its upper part, through which the cartridges are fed to the breech of said firearm, loosely-mounted sliding lips, and separate springs for yieldingly holding said lips over said opening, in combination with a firearm having projections adapted to engage said lips to move the same out of the path of the cartridges when the magazine is attached thereto.

17. A magazine adapted to be attached to and detached from a firearm, said magazine having an opening in its upper part, through which the cartridges are fed to the breech of said firearm, two lips *l* adapted to slide longitudinally of the magazine, and springs *k* yieldingly holding said lips over said opening.

808,939. CAR STARTING AND STOPPING DEVICE. ROBERT MAW, Montreal, Canada. Filed Sept. 9, 1905. Serial No. 277,701.



Claim.—1. In a car starting and stopping device, the combination of a plurality of air-compressors, chain-gearing connecting the compressors to the axles of the truck, a reservoir adapted to contain compressed air, a pipe connecting the compressors and the reservoir, an air-meter geared to the truck-axles, a pipe connecting the reservoir with the air-meter, a controlling-valve in said pipe clutches mounted on the truck-axles for throwing the compressor and the air-meter in and out of gear, means for actuating the clutches, and means for controlling said actuating means, substantially as described.

2. In a car starting and stopping device, the combination of a plurality of water-jacketed air-compressors, a reducing-gear connecting the compressors to the truck-axles, a reservoir adapted to contain compressed air, a flexible pipe connecting the compressors

and the reservoir, an air-motor, a reducing-gear connecting the air-motor to the truck-axles, a pipe connecting the air-motor and the reservoir, a controlling-valve in said pipe, clutches mounted on the axles adapted to throw the compressors and air-motor in and out of gear, an air-actuated system of tension-rods and levers for operating said clutches, and means for controlling said air-actuated system, substantially as described.

3. In a car starting and stopping device, the combination of a plurality of air-compressors geared to the truck-axles, a plurality of clutches, mounted on the axles, adapted to throw the air-compressors in and out of gear, a reservoir connected to the air-compressors, a reversible air-motor connected to the reservoir, clutches, mounted on the axles, adapted to throw the air-motor in and out of gear, a system of tension-rods and levers adapted to operate the clutches, air-actuated means for operating said tension-rods and levers, valves for controlling said air-actuated means, and an emergency-brake connected to the gearing of the air-compressor, substantially as described.

4. In a car starting and stopping device, the combination of a pair of compressor-pumps, sprocket-wheels mounted on one end of the truck-axles and connected to the compressor-pumps by chain-gearing, clutches attached to said sprocket-wheels adapted to throw the compressor-pumps in and out of gear, a reservoir connected to the compressor-pumps, a reversible air-motor, sprocket-wheels mounted on the opposite end of the truck-axles and connected to the air-motor by chain-gearing, a second series of clutches adapted to throw the air-motor in and out of gear, a pipe connecting the reservoir and the air-motor, a controlling-valve mounted in said pipe, tension-rods and levers adapted to operate said clutches, air-actuated pistons for operating said tension-rods and levers, valves for controlling said air-actuated pistons, and an emergency band-brake connected to the gearing of the air-compressor, substantially as described.

808,940. COMBINATION ADJUSTABLE TRESTLE. JOHN W. KEMER, Bureau county, Ill. Filed July 10, 1905. Serial No. 269,000.

Claim.—1. A trestle comprising legs consisting of a plurality of sections and couplings for uniting said sections whereby the trestle is adjustable in height by using a greater or less number of said sections, a cross-bar consisting of a plurality of sections and couplings uniting said sections whereby the trestle is adjustable longitudinally by using a greater or less number of said sections and a coupling consisting of two members for uniting said legs and cross-bar, each of said members having a longitudinal bore therein in which said legs are adjustable, said cross-bar constituting an axis for said members, said members being adjustable to different radii upon said axis, substantially as described.

2. A trestle comprising legs consisting of a plurality of sections and couplings for uniting said sections, a cross-bar consisting of a plurality of sections and couplings uniting said sections whereby the trestle is adjustable longitudinally by using a greater or less number of said sections, and a coupling consisting of two members for uniting said legs and cross-bar, each of said members having a longitudinal bore therein in which said legs are adjustable, said bores being disposed out of plane with each other, said members having a transverse bore therein, in which said cross-bar is adjustable, said cross-bar constituting an axis for said members, said members being adjustable to different radii upon said axis and means carried by said members for securing said legs and said cross-bar in adjusted position, substantially as described.

3. A trestle comprising legs consisting of a plurality of sections and couplings for uniting said sections, a cross-bar consisting of a plurality of sections and couplings uniting said sections, said cross-bar being adjustable longitudinally by using a greater or less number of said sections and a coupling consisting of two members for uniting said legs and cross-bar, each of said members having a longitudinal bore therein, in which said legs are adjustable, said bores being disposed out of plane with each other, said members having interlocking lugs through which said cross-bar is adapted to pass, said cross-bar constituting an axis for said members upon which said members are adjusted to different radii, substantially as described.

4. A trestle comprising outwardly-inclined, extensible legs and extensible cross-bar, a coupling consisting of two members for uniting said legs and cross-bar, each of said members having a longitudinal bore therein in which said legs are adjustable, said bores being disposed out of plane with each other, said members having interlocking lugs, through which said cross-bar is adapted to pass, said cross-bar constituting an axis for said members upon which said members are adjustable to different radii, substantially as described.

808,941. RACKING APPARATUS. HENRY G. MILLER and GEORGE R. LAWRENCE, Cleveland, Ohio. Filed Feb. 27, 1905. Serial No. 247,446.

Claim.—1. In a racking apparatus, the combination of a sealing tube and head, a filling-tube sliding within said tube, means for raising and lowering each of said tubes, and controlling-means for actuating said raising and lowering means and connected to be positively operated to first actuate the sealing-tube-lowering means and then the filling-tube-lowering means and a chamber communicating with the sealing-head to receive the overflow from the filled package, and a float device in said chamber and connected to actuate both raising means when lifted by the overflow.

2. In a racking apparatus, the combination with a liquid-supply receptacle having a counter-pressure supply above the liquid, of a filling-tube entering the package, a counter-pressure-supply tube communicating to the package above the liquid-level, and means for cutting off the liquid-supply before the counter-pressure supply and for withdrawing the filling-tube before the supply-tube, whereby the liquid is held under counter-pressure until immediately preceding the closing of the package.

3. In a racking apparatus, the combination of a sealing tube and head, a filling-tube sliding within said tube and provided with means for opening it by contact with the bottom of the package and for closing it by withdrawal from the same, fluid-pressure cylinders and pistons connected to said tubes to raise and lower the same, valves for admitting and exhausting the fluid-pressure at the opposite ends of said cylinders and having means for automatically actuating them into the raising positions and said valves connected to be moved together into their lowering positions, a handle for moving one of said valves into the lowering position, a catch for retaining said handle in such position, and a float actuated by the rising of the liquid in the package and connected to said catch to release the same when maximum level is attained in the package.

4. In a racking apparatus, the combination with a filling-tube and a sealing tube and head having suitable fluid-counter-pressure supply and means for independently raising and lowering each of said tubes, the structure composed of said elements being suspended to swing in a vertical plane, of fluid-pressure actuating means connected to said structure to swing the same and having its controlling means connected to be actuated by the raising means at the end of their operative movements.

5. In a racking apparatus, the combination with a filling-tube and a sealing tube and head having suitable fluid-counter-pressure supply and means for independently raising and lowering each of said tubes, the structure composed of said elements being suspended to swing in a vertical plane, of means connected to said structure to swing the same, controlling means for actuating said raising and lowering means and connected to be positively operated to first actuate the sealing-tube-lowering means and then the filling-tube-lowering means and to be automatically operated by the filling of the package to actuate both raising means, and controlling means for the tilting device and connected to be operated from the filling-tube-raising means at the extreme raised position of said tube to actuate the swinging means to tilt the structure out of operative position and to be operated by the positive lowering-controlling means to swing the structure into operative position.

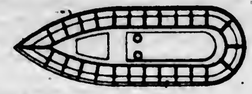
6. In a racking apparatus, the combination of a sealing tube and head, a filling-tube sliding within said tube, fluid-pressure cylinders and pistons connected to said tubes to raise and lower the same, valves for admitting and exhausting the fluid-pressure at the opposite ends of said cylinders and having means for automatically actuating them into the raising positions and said valves connected to be moved together into their lowering positions, a handle for moving one of said valves into the lowering position, a catch for retaining said handle in such position, a float actuated by the rising of the liquid in the package and connected to said catch to release the same when maximum level is attained in the package, a fluid-pressure cylinder connected to tilt the foregoing structure into and out of operative position, and a valve for admitting and exhausting fluid-pressure into said cylinder and having operative means projecting into the filling-tube-actuating cylinder to be operated by the piston in the same

7. In a racking apparatus, the combination with a sealing tube and head, a filling-tube, and fluid-pressure means for raising and lowering the same, of valve mechanism controlling the fluid-pressure for such means, a hand-lever actuating such controlling mechanism, a detent for retaining said lever in its position for lowering the tubes, a float-chamber and float connected to the sealing-head, and means connected to be actuated by the rising of said float and connected to the detent to release the same by such rising of the float.

8. In a racking apparatus, the combination of a sealing tube and head, a filling-tube sliding within said tube and head, a cylinder and piston connected to the sealing-tube to raise and lower the same, a cylinder and piston above said other cylinder and connected to the filling-tube to raise and lower the same, pivotal support for said filling tube cylinder, a horizontal cylinder and piston connected to said latter cylinder to swing it in a vertical plane, a valve for controlling inlet and exhaust of motive fluid into and out of said horizontal cylinder a stem projecting into the filling-tube cylinder to be engaged and moved by the rising piston in the same and having means for forcing it against such piston and connected to the valve to operate the same, an extensible and contractible connection between the sealing-tube cylinder and the filling-tube cylinder and having stops for limiting the longitudinal movement of the former in its relation to the latter, a valve controlling the inlet and exhaust from both ends of the sealing-tube cylinder, a hand-lever for said valve and connected to the same to place it in position to admit motive fluid to the upper end of the cylinder when moved into a horizontal position, means for retaining said lever in such position, a valve-controlling inlet and exhaust of motive fluid into and out of both ends of the filling-tube cylinder, an arm connected to operate said valve and to place the valve in position to admit motive fluid to the lower end of the cylinder when in its uppermost position and to admit motive fluid into the upper end of the cylinder when in its middle position and to connect both ends to the cylinder when in its lowermost position, and a flexible connection between the hand-lever and said arm.

9. In a racking apparatus, the combination of a sealing tube and head, a piston upon said tube, a cylinder surrounding said tube and having the piston sliding within it, a filling-tube sliding within the sealing-tube and having a piston, a cylinder surrounding the filling-tube and having its piston sliding within it and provided with lateral trunnions, supports for said trunnions, a horizontal cylinder and piston connected to the upper end of the filling-tube cylinder to tilt the same in a vertical plane, a valve controlling admission and exhaust of motive fluid to and from said horizontal cylinder, a bar sliding in the upper end of the filling-tube cylinder to be slid by the piston at the upper extreme of its stroke and having a spring forcing it against said piston and connected to the valve of the horizontal cylinder, the valve 39 for the sealing-tube cylinder and having the hand-lever 45, detent mechanism for said hand-lever, the float 63 and chamber 33 connected to the sealing-head, the reloading means actuated by the rising of said float and connected to the detent, the rods 19 having the stops 20 and 21 and sliding in the cars 18, the valve-casing 66 having the distributing ports and passages 64 and 65 and inlet and outlet 68, the valve 70 having the passage 71 and recess 72 and passages 73 and 74, the stop 76, the valve-arm 75, and the chain 78 attached to said valve-arm and to the hand-lever.

808,942. MARINE-TORPEDO GUARD. JOHN NEUMANN, Milwaukee, Wis., assignor of one-half to George L. Boldenz, Milwaukee, Wis. Filed July 6, 1905. Serial No. 268,410.



Claim.—1. In a device for capturing marine torpedoes as they approach a vessel, the combination with the vessel sides of a series of torpedo-receiving chambers having converging walls adapted to contact with the converging walls of an approaching torpedo and stop the same and means for supporting said chambers beneath the surface of the water at a distance from the vessel.

2. In a device for capturing marine torpedoes as they approach a vessel, the combination with the vessel sides of a series of torpedo-receiving chambers having converging walls adapted to contact with the converging walls of an approaching torpedo and stop the same; means for supporting said chambers beneath the surface of the water at a distance from the vessel and means for adjusting the walls of the receiving-chambers at any desired angle to the surface of the water.

3. In a device for capturing marine torpedoes as they approach a vessel, the combination with the vessel sides of a series of torpedo-receiving chambers having converging walls adapted to contact with the converging walls of an approaching torpedo and stop the same; means for supporting said chambers beneath the surface of the water at a distance from the vessel; means for adjusting the walls of the receiving-chambers at any desired angle to the surface of the water and means for automatically tilting the receiving-chamber and throwing the rear end of the torpedo above the surface of the water.

4. In a device for capturing marine torpedoes as they approach a vessel, the combination with the vessel sides of a series of torpedo-receiving chambers having converging walls adapted to contact with the converging walls of an approaching torpedo and stop the same; means for supporting said chambers beneath the surface of the water at a distance from the vessel; means for adjusting the walls of the receiving-chambers at any desired angle to the surface of the water; means for automatically tilting the receiving-chamber and throwing the rear end of the torpedo above the surface of the water and means actuated by the approaching torpedo for closing an electric circuit between a battery and a signal, whereby notice will be given in a vessel when a torpedo is captured.

5. In a device for capturing marine torpedoes as they approach a vessel, the combination with the vessel sides of a series of torpedo-receiving chambers having converging walls adapted to contact with the converging walls of an approaching torpedo and stop the same; means for supporting said chambers beneath the surface of the water at a distance from the vessel and means for automatically tilting the receiving-chamber as a torpedo enters, consisting in an air-receiving sack; an air-duct communicating from an air-reservoir; an air-controlling valve; a link communicating between one of the movable walls of the receiving-chamber and said valve, whereby, as a torpedo enters said chamber, said valve will be opened, said sack inflated, said receiver tilted and the rear end of the torpedo thrown above the surface of the water. substantially as set forth.

808,948. APPARATUS FOR FORMING SERPENTINE HOLLOW BODIES. KENNEDY PARK, Mansfield, Ohio. Filed Mar. 30, 1905. Serial No. 253,303.

Claim.—1. An apparatus of the character stated, comprising rotary or oscillatory dies adapted to externally form a serpentine hollow body, an oscillatory, expansible and contractible support for the interior of said body, and means for intermittently and positively expanding said support.

2. An apparatus of the character stated, comprising rotary or oscillatory dies adapted to externally form a serpentine hollow body, an expansible oscillatory mandrel adapted to occupy the interior of

and the reservoir, an air-motor, a reducing-gear connecting the air-motor to the truck-axles, a pipe connecting the air-motor and the reservoir, a controlling-valve in said pipe, clutches mounted on the axles adapted to throw the compressors and air-motor in and out of gear, an air-actuated system of tension-rods and levers for operating said clutches, and means for controlling said air-actuated system, substantially as described.

3. In a car starting and stopping device, the combination of a plurality of air-compressors geared to the truck-axles, a plurality of clutches, mounted on the axles, adapted to throw the air-compressors in and out of gear, a reservoir connected to the air-compressors, a reversible air-motor connected to the reservoir, clutches, mounted on the axles, adapted to throw the air-motor in and out of gear, a system of tension-rods and levers adapted to operate the clutches, air-actuated means for operating said tension-rods and levers, valves for controlling said air-actuated means, and an emergency-brake connected to the gearing of the air-compressor, substantially as described.

4. In a car starting and stopping device, the combination of a pair of compressor-pumps, sprocket-wheels mounted on one end of the truck-axles and connected to the compressor-pumps by chain-gearing, clutches attached to said sprocket-wheels adapted to throw the compressor-pumps in and out of gear, a reservoir connected to the compressor-pumps, a reversible air-motor, sprocket-wheels mounted on the opposite end of the truck-axles and connected to the air-motor by chain-gearing, a second series of clutches adapted to throw the air-motor in and out of gear, a pipe connecting the reservoir and the air-motor, a controlling-valve mounted in said pipe, tension-rods and levers adapted to operate said clutches, air-actuated pistons for operating said tension-rods and levers, valves for controlling said air-actuated pistons, and an emergency band-brake connected to the gearing of the air-compressor, substantially as described.

808,940. COMBINATION ADJUSTABLE TRESTLE. JOHN W. MIMMS, Bureau county, Ill. Filed July 10, 1905. Serial No. 269,000.

Claim.—1. A trestle comprising legs consisting of a plurality of sections and couplings for uniting said sections whereby the trestle is adjustable in height by using a greater or less number of said sections, a cross-bar consisting of a plurality of sections and couplings uniting said sections whereby the trestle is adjustable longitudinally by using a greater or less number of said sections and a coupling consisting of two members for uniting said legs and cross-bar, each of said members having a longitudinal bore therein in which said legs are adjustable and having a transverse bore therein in which said cross-bar is adjustable, said cross-bar constituting an axis for said members, said members being adjustable to different radii upon said axis, substantially as described.

2. A trestle comprising legs consisting of a plurality of sections and couplings for uniting said sections, a cross-bar consisting of a plurality of sections and couplings uniting said sections whereby the trestle is adjustable longitudinally by using a greater or less number of said sections, and a coupling consisting of two members for uniting said legs and cross-bar, each of said members having a longitudinal bore therein in which said legs are adjustable, said bores being disposed out of plane with each other, said members having a transverse bore therein, in which said cross-bar is adjustable, said cross-bar constituting an axis for said members, said members being adjustable to different radii upon said axis and means carried by said members for securing said legs and said cross-bar in adjusted position, substantially as described.

3. A trestle comprising legs consisting of a plurality of sections and couplings for uniting said sections, a cross-bar consisting of a plurality of sections and couplings uniting said sections, said cross-bar being adjustable longitudinally by using a greater or less number of said sections and a coupling consisting of two members for uniting said legs and cross-bar, each of said members having a longitudinal bore therein, in which said legs are adjustable, said bores being disposed out of plane with each other, said members having interlocking lugs through which said cross-bar is adapted to pass, said cross-bar constituting an axis for said members upon which said members are adjusted to different radii, substantially as described.

4. A trestle comprising outwardly-inclined, extensible legs and extensible cross-bar, a coupling consisting of two members for uniting said legs and cross-bar, each of said members having a longitudinal bore therein in which said legs are adjustable, said bores being disposed out of plane with each other, said members having interlocking lugs, through which said cross-bar is adapted to pass, said cross-bar constituting an axis for said members upon which said members are adjustable to different radii, substantially as described.

808,941. RACKING APPARATUS. HERBERT G. MILLER and GEORGE R. LAWRENCE, Cleveland, Ohio. Filed Feb. 27, 1905. Serial No. 247,446.

Claim.—1. In a racking apparatus, the combination of a sealing tube and head, a filling-tube sliding within said tube, means for raising and lowering each of said tubes, and controlling means for actuating said raising and lowering means and connected to be positively operated to first actuate the sealing-tube-lowering means and then the filling-tube-lowering means and a chamber communicating with the sealing-head to receive the overflow from the filled package, and a float device in said chamber and connected to actuate both raising means when lifted by the overflow.

2. In a racking apparatus, the combination with a liquid-supply receptacle having a counter-pressure supply above the liquid, of a filling-tube entering the package, a counter-pressure-supply tube communicating to the package above the liquid-level, and means for cutting off the liquid-supply before the counter-pressure supply and for withdrawing the filling-tube before the supply-tube, whereby the liquid is held under counter-pressure until immediately preceding the closing of the package.

3. In a racking apparatus, the combination of a sealing tube and head, a filling-tube sliding within said tube and provided with means for opening it by contact with the bottom of the package and for closing it by withdrawal from the same, fluid-pressure cylinders and pistons connected to said tubes to raise and lower the same, valves for admitting and exhausting the fluid-pressure at the opposite ends of said cylinders and having means for automatically actuating them into the raising positions and said valves connected to be moved together into their lowering positions, a handle for moving one of said valves into the lowering position, a catch for retaining said handle in such position, and a float actuated by the rising of the liquid in the package and connected to said catch to release the same when maximum level is attained in the package.

4. In a racking apparatus, the combination with a filling-tube and a sealing tube and head having suitable fluid-counter-pressure supply and means for independently raising and lowering each of said tubes, the structure composed of said elements being suspended to swing in a vertical plane, of fluid-pressure actuating means connected to said structure to swing the same and having its controlling means connected to be actuated by the raising means at the end of their operative movements.

5. In a racking apparatus, the combination with a filling-tube and a sealing tube and head having suitable fluid-counter-pressure supply and means for independently raising and lowering each of said tubes, the structure composed of said elements being suspended to swing in a vertical plane, of means connected to said structure to swing the same, controlling means for actuating said raising and lowering means and connected to be positively operated to first actuate the sealing-tube-lowering means and then the filling-tube-lowering means and to be automatically operated by the filling of the package to actuate both raising means, and controlling means for the tilting device and connected to be operated from the filling-tube-raising means at the extreme raised position of said tube to actuate the swinging means to tilt the structure out of operative position and to be operated by the positive lowering-controlling means to swing the structure into operative position.

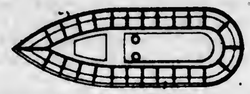
6. In a racking apparatus, the combination of a sealing tube and head, a filling-tube sliding within said tube, fluid-pressure cylinders and pistons connected to said tubes to raise and lower the same, valves for admitting and exhausting the fluid-pressure at the opposite ends of said cylinders and having means for automatically actuating them into the raising positions and said valves connected to be moved together into their lowering positions, a handle for moving one of said valves into the lowering position, a catch for retaining said handle in such position, a float actuated by the rising of the liquid in the package and connected to said catch to release the same when maximum level is attained in the package, a fluid-pressure cylinder connected to tilt the foregoing structure into and out of operative position, and a valve for admitting and exhausting fluid-pressure into said cylinder and having operative means projecting into the filling-tube-actuating cylinder to be operated by the piston in the same

7. In a racking apparatus, the combination with a sealing tube and head, a filling-tube, and fluid-pressure means for raising and lowering the same, of valve mechanism controlling the fluid-pressure for such means, a hand-lever actuating such controlling mechanism, a detent for retaining said lever in its position for lowering the tubes, a float-chamber and float connected to the sealing-head, and means connected to be actuated by the rising of said float and connected to the detent to release the same by such rising of the float.

8. In a racking apparatus, the combination of a sealing tube and head, a filling-tube sliding within said tube and head, a cylinder and piston connected to the sealing-tube to raise and lower the same, a cylinder and piston above said other cylinder and connected to the filling-tube to raise and lower the same, pivotal support for said filling tube cylinder, a horizontal cylinder and piston connected to said latter cylinder to swing it in a vertical plane, a valve for controlling inlet and exhaust of motive fluid into and out of said horizontal cylinder a stem projecting into the filling-tube cylinder to be engaged and moved by the rising piston in the same and having means for forcing it against such piston and connected to the valve to operate the same, an extensible and contractible connection between the sealing-tube cylinder and the filling-tube cylinder and having stops for limiting the longitudinal movement of the former in its relation to the latter, a valve controlling the inlet and exhaust from both ends of the sealing-tube cylinder, a hand-lever for said valve and connected to the same to place it in position to admit motive fluid to the upper end of the cylinder when moved into a horizontal position, means for retaining said lever in such position, a valve-controlling inlet and exhaust of motive fluid into and out of both ends of the filling-tube cylinder, an arm connected to operate said valve and to place the valve in position to admit motive fluid to the lower end of the cylinder when in its uppermost position and to admit motive fluid into the upper end of the cylinder when in its middle position and to connect both ends to the exhaust when in its lowermost position, and a flexible connection between the hand-lever and said arm.

9. In a racking apparatus, the combination of a sealing tube and head, a piston upon said tube, a cylinder surrounding said tube and having the piston sliding within it, a filling-tube sliding within the sealing-tube and having a piston, a cylinder surrounding the filling-tube and having its piston sliding within it and provided with lateral trunnions, supports for said trunnions, a horizontal cylinder and piston connected to the upper end of the filling-tube cylinder to tilt the same in a vertical plane, a valve controlling admission and exhaust of motive fluid to and from said horizontal cylinder, a bar sliding in the upper end of the filling-tube cylinder to be slid by the piston at the upper extreme of its stroke and having a spring forcing it against said piston and connected to the valve of the horizontal cylinder, the valve 30 for the sealing-tube cylinder and having the hand-lever 45, detent mechanism for said hand-lever, the float 63 and chamber 33 connected to the sealing-head, the releasing means actuated by the rising of said float and connected to the detent, the rods 19 having the stops 20 and 21 and sliding in the cars 18, the valve-casing 66 having the distributing ports and passages 64 and 65 and inlet and outlet 68, the valve 70 having the passage 71 and recess 72 and passages 73 and 74, the stop 76, the valve-arm 75, and the chain 78 attached to said valve-arm and to the hand-lever.

808,942. MARINE-TORPEDO GUARD. JOHN NEUMAIER, Milwaukee, Wis., assignor of one-half to George L. Baldauf, Milwaukee, Wis. Filed July 6, 1905. Serial No. 268,416.



Claim.—1. In a device for capturing marine torpedoes as they approach a vessel, the combination with the vessel sides of a series of torpedo-receiving chambers having converging walls adapted to contact with the converging walls of an approaching torpedo and stop the same and means for supporting said chambers beneath the surface of the water at a distance from the vessel.

2. In a device for capturing marine torpedoes as they approach a vessel, the combination with the vessel sides of a series of torpedo-receiving chambers having converging walls adapted to contact with the converging walls of an approaching torpedo and stop the same; means for supporting said chambers beneath the surface of the water at a distance from the vessel and means for adjusting the walls of the receiving-chambers at any desired angle to the surface of the water.

3. In a device for capturing marine torpedoes as they approach a vessel, the combination with the vessel sides of a series of torpedo-receiving chambers having converging walls adapted to contact with the converging walls of an approaching torpedo and stop the same; means for supporting said chambers beneath the surface of the water at a distance from the vessel; means for adjusting the walls of the receiving-chambers at any desired angle to the surface of the water and means for automatically tilting the receiving-chamber and throwing the rear end of the torpedo above the surface of the water.

4. In a device for capturing marine torpedoes as they approach a vessel, the combination with the vessel sides of a series of torpedo-receiving chambers having converging walls adapted to contact with the converging walls of an approaching torpedo and stop the same; means for supporting said chambers beneath the surface of the water at a distance from the vessel; means for adjusting the walls of the receiving-chambers at any desired angle to the surface of the water; means for automatically tilting the receiving-chamber and throwing the rear end of the torpedo above the surface of the water and means actuated by the approaching torpedo for closing an electric circuit between a battery and a signal, whereby notice will be given in a vessel when a torpedo is captured.

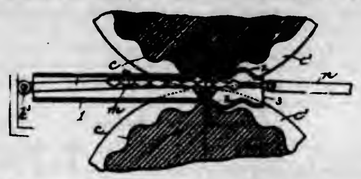
5. In a device for capturing marine torpedoes as they approach a vessel, the combination with the vessel sides of a series of torpedo-receiving chambers having converging walls adapted to contact with the converging walls of an approaching torpedo and stop the same; means for supporting said chambers beneath the surface of the water at a distance from the vessel and means for automatically tilting the receiving-chamber as a torpedo enters, consisting in an air-receiving sack; an air-duct communicating from an air-reservoir; an air-controlling valve; a link communicating between one of the movable walls of the receiving-chamber and said valve, whereby, as a torpedo enters said chamber, said valve will be opened, said sack inflated, said receiver tilted and the rear end of the torpedo thrown above the surface of the water. substantially as set forth.

808,943. APPARATUS FOR FORMING SERPENTINE HOLLOW BODIES. KENNEDY PARK, Mansfield, Ohio. Filed Mar. 20, 1905. Serial No. 251,203.

Claim.—1. An apparatus of the character stated, comprising rotary or oscillatory dies adapted to externally form a serpentine hollow body, an oscillatory, expansible and contractible support for the interior of said body, and means for intermittently and positively expanding said support.

2. An apparatus of the character stated, comprising rotary or oscillatory dies adapted to externally form a serpentine hollow body, an expansible oscillatory mandrel adapted to occupy the interior of

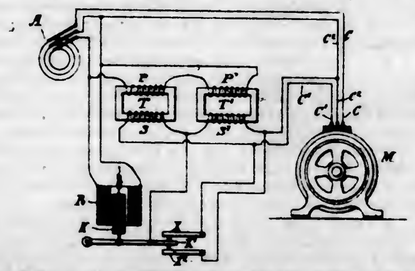
a hollow body between said dies, means for moving the dies in unison, and means for intermittently and positively expanding the mandrel.



3. In apparatus of the character stated, comprising rotary or oscillatory dies adapted to externally form a serpentine hollow body, a mandrel composed of separable sections each hinged to a fixed support, an expanding and contracting device interposed between said sections, and means for moving said device and the dies simultaneously.

4. An apparatus of the character stated, comprising rotary or oscillatory dies adapted to externally form a serpentine hollow body, a mandrel composed of separable sections each hinged to a fixed support, a filling-piece interposed between said sections, said filling-piece having alternating projections and recesses, and means for simultaneously moving the dies and filling-piece.

808,944. **ALTERNATING-CURRENT-MOTOR REVERSER.** EDWIN H. FOSTER and BURLEIGH CURRIER, Philadelphia, Pa. Filed Mar. 20, 1905. Serial No. 250,615.



Claim.—1. The combination of a source of alternating-current energy, a motor connected with and adapted to operate from said source of energy having a plurality of energizing-circuits, part of which energizing-circuits is supplied with two opposing alternating electromotive forces in series and means for automatically varying one or both the opposing electromotive forces so that their sum is greater or less than zero, as desired, substantially as described.

2. The combination of a source of alternating-current energy, a motor connected with and adapted to operate from said source of energy having a plurality of energizing-circuits, part of which energizing-circuits is supplied with two equal opposing electromotive forces in series and means for automatically varying one or both the opposing electromotive forces so that their sum is either greater or less than zero, substantially as described.

3. The combination of a source of alternating-current energy, a motor connected with and adapted to operate from said source of energy, having a plurality of energizing-circuits, part of which energizing-circuits is supplied with an alternating electromotive force that is a variable resultant of two alternating opposing equal electromotive forces in series, one or both of which are automatically varied to produce the said resultant alternating electromotive force and means for varying the opposing electromotive forces, substantially as described.

4. The combination of a source of alternating-current energy, a motor connected with and adapted to operate from said source of energy, having a plurality of independent energizing-circuits, part of which energizing-circuits is supplied with an alternating electromotive force that is a variable resultant of two alternating opposing equal electromotive forces in series, one or both of which are automatically varied to produce the desired resultant electromotive force and means for varying said opposing electromotive forces, substantially as described.

5. The combination of a source of alternating-current energy, a motor connected with and adapted to operate from said source of energy, having a plurality of independent energizing-circuits, each of which is supplied with an alternating electromotive force that is a variable resultant of two alternating opposing electromotive forces in series, one of which is short-circuited to produce the desired resultant electromotive force and means for short-circuiting either of said opposing electromotive forces, substantially as described.

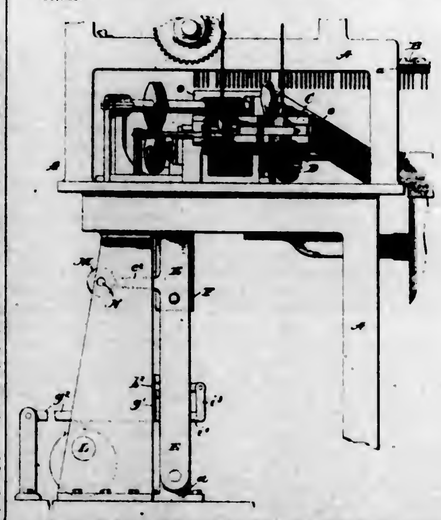
6. The combination of a source of alternating-current energy, a motor connected with and adapted to operate from said source of energy, having a plurality of independent energizing-circuits, each of which is supplied with an alternating electromotive force that is a variable resultant of two alternating opposing electromotive forces in series, one of which is short-circuited to produce the desired resultant electromotive force and means for short-circuiting either of said opposing electromotive forces, substantially as described.

7. The combination of a multiphase source of alternating-current energy, a multiphase motor, having a plurality of independent energizing-circuits energized by said source, pairs of transformers having their secondaries opposed and in series with each independent energizing-circuit, primaries of each pair of said transformers in series and connected to said source of alternating-current energy and means for short-circuiting the secondary of either transformer of each pair, substantially as described.

8. The combination of a multiphase source of alternating-current energy, a multiphase motor, having a plurality of independent energizing-circuits energized from said source, two transformers having their secondaries opposed in series and connected to one of said energizing-circuits, their primaries also in series and connected to said source of energy and means for short-circuiting the secondary of either transformer.

9. The combination of a multiphase source of alternating-current energy, a multiphase motor having a plurality of energizing-circuits energized by said source, part of said energizing-circuits supplied with alternating electromotive forces each of which is a variable resultant of two opposing alternating electromotive forces in series, one or both of which are automatically varied to produce said resultant, and means for automatically varying either or both of said opposing electromotive forces, substantially as described.

808,945. **MATCH-MAKING MACHINE.** EDWIN J. PRINDLE, Washington, D. C., assignor to The Diamond Match Company, New York, N. Y., a Corporation of Illinois. Filed Apr. 15, 1901. Serial No. 56,045.



Claim.—1. In a match-machine, the combination with a carrier, of a splint-cutter, an air-trunk, and a splint-holder that engages the splint on the side next the inlet to the air-trunk and prevents the splint being carried toward the inlet said cutter being situated between the holder and the carrier.

2. In a match-machine, the combination with a carrier, of a splint-cutter, and a splint-holder supplemental to and separate from the cutter that surrounds the splint and holds it from lateral movement in any direction, the splint-cutter being situated between the carrier and the holder.

3. In a match-machine, the combination with a carrier, of a splint-cutter, means for reciprocating the same toward and from the carrier, a holder for the splints, means for reciprocating said holder toward and from the carrier, means for inserting the splints into the carrier while the carrier is in motion, and means for moving the said holder with the carrier during the insertion of the splints.

4. In a match-machine, the combination with a carrier, of a splint-cutter, and a holder for the splint, means for inserting the splint into the carrier while the splint is held both by said cutter and such holder, and means for moving said cutter and such holder with the carrier during the insertion of the splint, substantially as and for the purpose described.

5. In a match-machine, the combination with a continuously-moving carrier, of a splint-cutter, and a holder for the splint, means for inserting the splint into the carrier while the splint is held both by said cutter and such holder, and means for moving said cutter and such holder with the carrier during the insertion of the splint, substantially as and for the purpose described.

6. In a match-machine, the combination with a carrier constructed to hold and transport splints, of a splint-cutter, and a holder for the splint supplemental to and separate from the cutter, said cutter being located between the holder and the carrier means for inserting the splint into the carrier while the splint is held both by said cutter and such holder, and means for preventing the withdrawal of the splint from the carrier during the disengagement of the cutter and the holder from the splint, substantially as and for the purpose described.

7. In a match-machine, the combination with a carrier constructed to hold and transport splints, of a splint-cutter, and a holder supplemental to and separate from the cutter that surrounds the splint, said cutter being located between the holder and the carrier, means for inserting the splint into the carrier while the splint is held both by said cutter and such holder, and means for preventing the withdrawal of the splint from the carrier during the disengagement of the cutter and the holder from the splint, substantially as and for the purpose described.

8. In a match-machine, the combination with a carrier constructed to hold and transport splints, of a splint-cutter that surrounds the splint, a holder that surrounds the splint, supplemental to and separate from the cutter, said cutter being located between the holder and the carrier, means for inserting the splint into the carrier while the splint is held both by said cutter and by such holder, and means for preventing the withdrawal of the splint from the carrier during the disengagement of the cutter and the holder from the splint, substantially as and for the purpose described.

9. In a match-machine, the combination with a carrier constructed to hold and transport splints, of a splint-cutter that surrounds the splint, a holder that surrounds the splint supplemental to and separate from the cutter, said cutter being located between the holder and the carrier, means for inserting the splint into the carrier while the splint is held both by said cutter and by such holder, and for withdrawing said cutter and holder from the splint longitudinally thereof, and means for preventing the withdrawal of the splint from the carrier during the disengagement of the cutter and the holder from the splint, substantially as and for the purpose described.

10. In a match-machine, the combination with a carrier constructed to hold and transport splints, of a splint-cutter, and a holder supplemental to and separate from the cutter that surrounds the splint and is laterally immovable with relation to the cutter, said cutter being located between the holder and the carrier, means for inserting the splint into the carrier while the splint is held both by said cutter and by such holder, and means for preventing the withdrawal of the splint from the carrier during the disengagement of the cutter and the holder from the splint, substantially as and for the purpose described.

11. In a match-machine, the combination with a carrier, of a splint-cutter and a holder for the splint, means for inserting the splint into the carrier while the splint is held both by said cutter and such holder, means for moving said cutter and such holder with the carrier during the insertion of the splint, and means for preventing the withdrawal of the splint from the carrier during the disengagement of the cutter and the holder from the splint, substantially as and for the purpose described.

12. In a match-machine, the combination with a continuously-moving carrier, of a splint-cutter, and a holder for the splint, means for inserting the splint into the carrier while the splint is held both by said cutter and such holder, means for giving said cutter and such holder a movement with the carrier during the insertion of the splint, and means for preventing the withdrawal of the splint from the carrier during the disengagement of the cutter and the holder from the splint, substantially as and for the purpose described.

13. In a match-machine, the combination with a carrier constructed to hold and transport splints, of a tubular splint-cutter, and a tubular holder for the splint supplemental to and separate from the cutter, said cutter being located between the holder and the carrier, means for inserting the splint into the carrier while the splint is held both by said cutter and such holder, and means for preventing the withdrawal of the splint from the carrier during the disengagement of the cutter and the holder from the splint, substantially as and for the purpose described.

14. In a match-machine, the combination with a carrier, of a tubular splint-cutter, and a tubular holder for the splint supplemental to and separate from the cutter, means for inserting the splint into the carrier while the splint is held both by said cutter and such holder, and a pin which is adapted to bear upon the end of the splint while the cutter and the holder are disengaged from the splint, substantially as and for the purpose described.

15. In a match-machine, the combination with a carrier, of a tubular splint-cutter, and a tubular holder for the splint supplemental to and separate from the cutter, means for inserting the splint into the carrier while the splint is held both by said cutter and such holder, a pin which is adapted to bear upon the end of the splint, and means for moving said cutter and such holder along the splint and over such pin, substantially as and for the purpose described.

16. In a match-machine, the combination with a carrier, of a tubular splint-cutter, and a tubular holder for the splint, means for inserting the splint into the carrier while the splint is held both by said cutter and such holder, and means for giving said cutter and such holder a movement with the carrier during the insertion of the splint, substantially as and for the purpose described.

17. In a match-machine, the combination with a carrier, of a tubular splint-cutter, and a tubular holder for the splint, means for inserting the splint into the carrier while the splint is held both by said cutter and such holder, a pin which is adapted to bear upon the end of the splint, means for moving said cutter and such holder along the splint and over such pin, and means for giving said cutter, holder, and pin a movement with the carrier during the insertion of the splint, substantially as and for the purpose described.

18. In a match-machine, the combination with a carrier, of means movable in the direction of motion of the carrier for inserting a splint into such carrier, and an air-conduit adjacent thereto, said conduit having a portion in the path of the inserting means that is movable in the direction of travel of the carrier.

19. In a match-machine, the combination with a carrier, of a guide for the material from which the splint is formed, an air-conduit between said carrier and such guide, and means movable in the direction of motion of the carrier for inserting the splint into the carrier, said conduit having a portion yielding in the direction of movement of the carrier to permit movement of such means, substantially as and for the purpose described.

20. In a match-machine, the combination with a carrier, of a guide for the material from which the splint is formed, an air-conduit between said carrier and such guide, and means movable in the direction of motion of the carrier for forming the splint and inserting it into the carrier, said conduit having a portion yielding in the direction of movement of the carrier to permit movement of such means, substantially as and for the purpose described.

21. In a match-machine, the combination with a continuously-moving carrier of a guide for the material from which the splint is formed, an air-conduit between such carrier and said guide, means for inserting the splint into the carrier, and means for moving such inserting means with the carrier during the insertion of the splint into the carrier, said conduit having a portion yielding in the direction of movement of the carrier to permit movement of such splint-inserting means, substantially as and for the purpose described.

22. In a match-machine, the combination with a carrier, of means for inserting splints into the carrier, means for moving such inserting means with the carrier during the insertion of the splints therein, and an air-conduit having a portion in the path of the inserting means that is movable in the direction of travel of the carrier.

808,946. **RATCHET MECHANISM.** MICHAEL REISCH, Buffalo, N. Y., assignor to Rudy Reisch, Buffalo, N. Y. Filed May 24, 1905. Serial No. 262,106.

Claim.—1. The combination of a supporting-frame, an arbor

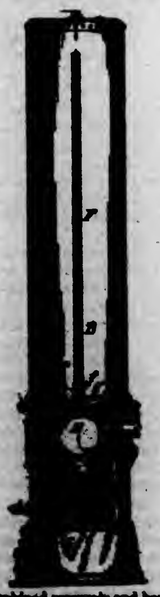
A A new article of manufacture, an overshoe having a neat-

held in the same against rotation and provided with a fixed holding-tooth having an inclined face and an abrupt back, an oscillatory actuating-casing mounted on said arbor, a ratchet mechanism actuated by said casing, and a return-spring having its outer end attached to said casing and its inner end provided with a holding-lip which engages the abrupt back of said tooth under the working strain and is free to move away from said tooth when the spring is strained in the opposite direction, substantially as set forth.

2. The combination of a supporting-frame, a removable arbor held therein against rotation, a sleeve having a holding-tooth and having a bore for the insertion of the arbor, said arbor and sleeve being provided with means for preventing the sleeve from turning on the arbor, an oscillatory actuating-casing mounted on said arbor, a ratchet mechanism actuated by said casing, and a return-spring having its outer end attached to said casing and its inner end provided with a holding-lip which engages said holding-tooth under the working strain and is free to move away from said tooth when the spring is strained in the opposite direction, substantially as set forth.

3. The combination of a supporting-frame having arbor-seats, one of which is flat-sided, an arbor adapted to be inserted into said seats and having a flat-sided end portion engaging in said flat-sided seat, a sleeve provided with a holding-tooth and having a flat-sided bore fitting the flat-sided portion of said arbor, an oscillatory actuating-casing mounted on said arbor, a ratchet mechanism actuated by said casing, and a return-spring having one end attached to said casing and the other end provided with a holding-lip which engages the tooth of said sleeve, substantially as set forth.

808,947. COMBINED WATER-HEATER AND PRESSURE-RESERVOIR. FRANK L. RAND, Chicago, Ill., assignor to James B. Clow & Son's, Chicago, Ill., a Corporation of Illinois. Filed Oct. 26, 1903. Serial No. 178,898.

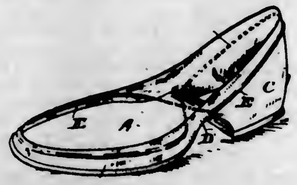


Claim.—1. A combined reservoir and heater comprising a casing, a reservoir which rises from and is supported on the casing, a combustion-chamber within the casing, which forms with the latter a water-leg, communicating at its top with the reservoir, a water-chamber within the combustion-chamber, a delivery-pipe which rises from the water-chamber through the reservoir and discharges into the top of the latter, said delivery-pipe communicating at its lower end with said water-chamber through an opening in the top wall of the combustion-chamber, and an inlet-pipe which passes through a smooth hole in the side wall of the combustion-chamber, enters an aperture in the side wall of the water-chamber, and communicates at its outer end with the water-leg, said delivery and inlet pipes being provided with removable packing means for making tight joints between the same and the top and side walls of the combustion-chamber.

2. A combined reservoir and heater comprising a casing, a reservoir which rises from and is supported on the casing, a combustion-chamber within the casing which forms with the latter a water-leg communicating at its top with the reservoir, a water-chamber located within the combustion-chamber, a delivery-pipe which leads from the water-chamber upwardly through the reservoir and discharges at its upper end into the latter, said delivery-pipe extending at its lower end downwardly through the top wall of the combustion-chamber and having screw-threaded connection with the top of the water-chamber, and an inlet-pipe which extends horizontally through the side wall of the combustion-chamber, communicates at its outer end with the water-leg, and has screw-threaded connection with the water-chamber; said water-chamber being provided at its top and side walls with annular, outwardly-facing shoulders which surround the delivery and inlet pipes and are adapted to bear against the inner faces of the top and side walls of the combustion-chamber, and the said delivery and inlet pipes being provided outside of said top and side walls with nuts and with gaskets interposed between the said nuts and the outer faces of said top and side walls.

3. A combined reservoir and heater comprising a casing, a reservoir which rises from and is supported on the casing, a combustion-chamber within the casing which forms with the latter a water-leg communicating at its top with the reservoir, a water-chamber located in the combustion-chamber, said water-chamber having a downwardly-convexed bottom and an integral, outwardly-directed branch forming an inlet-passage at the level of the lowermost part of the said chamber, an inlet-pipe which extends horizontally through the side wall of the combustion-chamber, is in communication at its outer end with the water-leg and is connected with said outwardly-directed branch inside of the combustion-chamber, the casing-wall being provided in line with the said inlet-pipe with an opening provided with a removable closure, and a discharge-pipe which communicates at its lower end with the top of the water-chamber, extends through the upper wall of the combustion-chamber, and discharges at its upper end at the top of the reservoir.

808,948. OVERSHOE. ALBERT B. ROGERS, Norwalk, Ohio, assignor to Hezekiah P. Bowler, Cleveland, Ohio. Filed Apr. 18, 1904. Serial No. 203,549.



Claim.—1. As a new article of manufacture, an overshoe provided with longitudinally-elastic side shanks and with loops restraining the heel and the front portions of the upper.

2. An overshoe having a non-elastic band passing around both its front and rear part and deflected at the shank to prevent the band restraining the elasticity of the side shanks.

3. An overshoe having a non-elastic band vulcanized in the overshoe and passing around the front portion and then deflecting into the sole of the shank portion, and a non-elastic band passing around the heel portion and deflecting inwardly into the shank.

4. In an overshoe having a relatively high heel portion and a relatively low front portion, a non-elastic band vulcanized in the upright walls of the overshoe except at the shank portion, and at this portion passing into the sole of the overshoe and there vulcanized in place.

5. An overshoe having a relatively high heel portion and a relatively low front portion, a non-elastic loop vulcanized in the overshoe and passing around the front portion and then into the sole of the shank portion, and a non-elastic loop passing around the heel portion high up on the heel portion to take above the rearmost bulge of the inserted shoe.

6. As a new article of manufacture, an overshoe having a non-elastic band vulcanized in the side walls of the front and heel portion of the overshoe, and crossing itself within the sole of the shank portion.

7. As a new article of manufacture, an overshoe having a non-elastic band vulcanized in the side walls of the front and heel portion of the overshoe and crossing itself within the sole of the shank portion, said band on the heel portion leading diagonally upward from the sole to near the top of the heel, the band being vulcanized in place throughout.

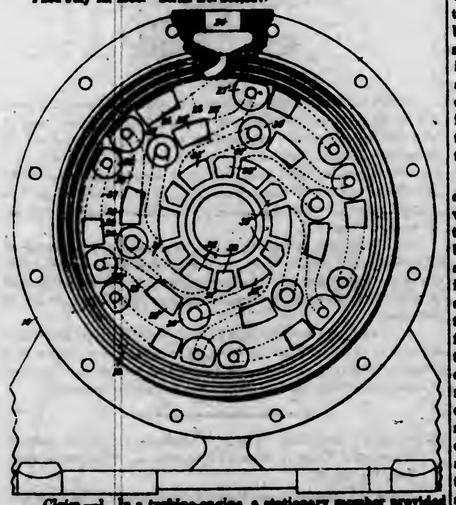
8. As a new article of manufacture, an overshoe having two non-elastic loops, one vulcanized into the side walls of the front of the overshoe, and the other vulcanized into the side walls of the heel of the overshoe, and both vulcanized into the sole of the overshoe at the shank.

808,949. MOLD FOR THE MANUFACTURING OF HAIR-PINS. THEOPHILUS REED, Newark, N. J. Filed May 15, 1905. Serial No. 260,495.

Claim.—1. The combination with a mold composed of an upper and lower die for simultaneously pointing the opposite ends of a number of hair-pin blanks in horizontal position, of an empty templet or guide-bar adapted to be temporarily placed upon the lower die of said mold to assist in placing the blanks into proper position for pointing and to be then exchanged for the upper die.

2. The combination with a mold composed of an upper and lower die for simultaneously pointing the opposite ends of a number of hair-pin blanks in horizontal position, of an empty templet or guide-bar adapted to be temporarily placed upon the lower die of said mold and provided with recesses or notches adapted to guide said blanks into their proper positions upon the lower die, said templet to be then exchanged for the upper die.

808,950. TURBINE-ENGINE. HENRY SCHELLE, Milwaukee, Wis. Filed July 12, 1905. Serial No. 269,217.



Claim.—1. In a turbine-engine, a stationary member provided with active faces on opposite sides, a movable member formed in sections each having an active face coöperating with one of the active faces of the stationary member, a sleeve on one section of the movable member projecting into an opening in the stationary member, and a boss on the other section of the movable member also projecting into said opening and threaded in the sleeve to join the two sections of the movable member and cause the end thrust of each section to counteract the end thrust of the other section and thus balance the end pressures of the movable member.

2. In a turbine-engine, a stationary member and a movable member having active faces coöperating with each other, a pressure-nozzle discharging through one active face, a series of blades supported on the other active face to receive pressure fluid from the nozzle, said blades comprising strips of metal angular in cross-section with one side longer than the other side to form a base engaging one end in a groove in their support, and a securing-strip fastened to said support and having a shoulder to engage the opposite end of the base of the blades.

3. A turbine member having an active face, a plurality of concentric series of blades in said active face comprising strips of sheet metal angular in cross-section with the portion in one plane longer than the portion in the other plane to form a base with end projections, said blades being embedded in a recess in the active face of the turbine member with one end projection of the outer and inner series of blades extending into grooves of the turbine member, and securing rings or strips countersunk in the recess of the turbine member and having shoulders to engage the other end projections of the outer and inner series of blades and also the end projections of the intermediate series of blades, the outer edges of the blades and the securing rings or strips being in the same plane with the active face of the turbine member.

4. In a turbine-engine, a stationary member and a movable member having coöperating active faces, concentric series of buckets on one active face, and pressure-nozzles on the other active face; said pressure-nozzles comprising a nozzle discharging into one series of buckets, another nozzle receiving the pressure fluid from said series of buckets and transferring it to another series of buckets, and a third nozzle connecting the first-mentioned series of buckets with the buckets of the same series farther in advance.

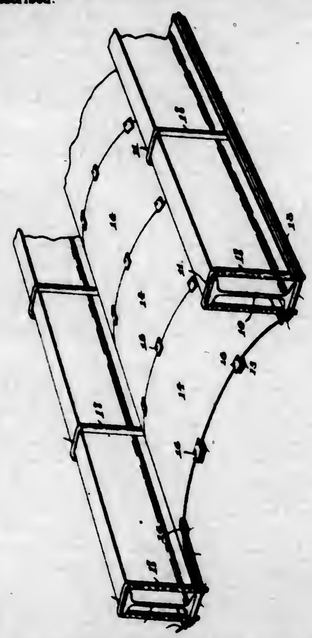
5. In a turbine-engine, a stationary member and a movable member having coöperating active faces, concentric series of buckets on one active face, and pressure-nozzles on the other active face; said pressure-nozzles comprising a nozzle discharging into one series of buckets, a set of nozzles receiving the pressure fluid from said series of buckets and transferring it to another series of buckets, and another set of nozzles connecting the first-mentioned series of buckets with the buckets of the same series farther in advance in the direction of rotation of the movable member.

6. In a turbine-engine, a stationary member having active faces on opposite sides, a movable member having active faces to coöperate with the active faces of the stationary member, a number of concentric series of buckets formed in each active face of the movable member, there being an inlet-chamber and an exhaust-chamber for pressure fluid in the stationary member, a pair of diverging nozzles leading from the inlet-chamber to each of the active faces of the stationary member and discharging into the outer series of buckets, and sets of transfer-nozzles in the active faces of the stationary member leading from each series of buckets to the inner series of buckets next thereto, the innermost series of buckets being adapted to discharge the pressure fluid through ports of the said exhaust-chamber.

7. In a turbine-engine, a stationary member having active faces on opposite sides, a movable member having active faces to coöperate with the active faces of the stationary member, a number of concentric series of buckets formed in each active face of the movable member, there being an inlet-chamber and an exhaust-chamber in the stationary member for pressure fluid, a pair of diverging nozzles leading from the inlet-chamber to each of the active faces of the stationary member and discharging into the outer series of buckets, sets of transfer-nozzles in the active faces of the stationary member leading from each series of buckets to the inner series of buckets next thereto, the innermost series of buckets being adapted to discharge the pressure fluid through ports of the said exhaust-chamber, other sets of nozzles in the active faces of the stationary member adapted to receive the remainder of the pressure fluid from the first-mentioned series of buckets after they pass by the transfer-nozzles and carry it to other buckets in the same series close to the next succeeding transfer-nozzle, pressure-tight connections between the movable member and the stationary member beyond the outer series of blades, and pressure-tight casings connected to the stationary member and inclosing the movable member.

808,951. CENTERING FOR ARCHES. LAWRENCE SCHILLER, Chicago, Ill. Filed Mar. 6, 1903. Serial No. 146,899.

Claim.—1. In a centering-support, the combination with hangers adapted to be hung over the floor-beams, of channels underlying the latter parallel therewith and suspended by said hangers, horizontal supports secured to the side walls of said channels, and centering-plates stopped at their ends on said horizontal supports, substantially as described.



2. In a centering-support, the combination with inverted-U-shaped hangers adapted to be hung over the floor-beams, of channels underlying the latter parallel therewith and suspended on the lower ends of said hangers, angle-irons secured to the side walls of said channels, and centering-plates stopped at their ends on said angle-irons, substantially as described.

3. In a centering-support, the combination with supporting members suspended from the floor-beams, of a series of centering-plates rested at their ends on adjacent supporting means, said centering-plates being provided on one edge thereof with guides adapted to receive the adjacent edge of the adjacent centering-plate, whereby to facilitate the alinement of the series of centering-plates, substantially as described.

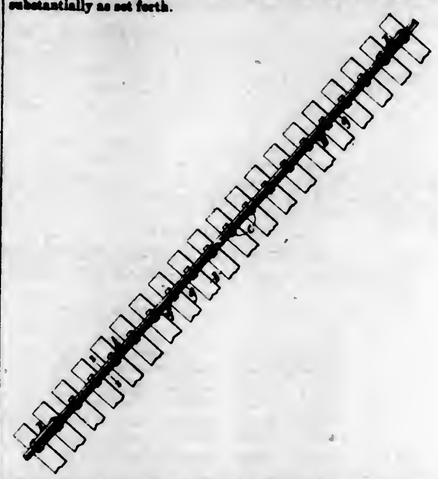
4. In a centering-support, the combination with inverted-U-shaped hangers adapted to be hung over the floor-beams, of channels underlying the latter parallel therewith and suspended on the lower ends of said hangers, angle-irons secured to the side walls of said channels, and metal arch-plates stopped at their ends on said angle-irons, substantially as described.

808,952. **ANTICREEPER FOR RAILWAYS.** JOHN O. SULLIVAN, Winnipeg, Canada. Filed July 3, 1905. Serial No. 268,893.

Claim.—1. The combination of the rails, the ties or supports thereof, a stop member secured to the rails, and a longitudinal anticreeper-bar secured to a plurality of said supports and abutting endwise against said stop member, whereby the longitudinal strains received by the rails are transmitted to and distributed over a number of the ties or supports by the anticreeper-bar, substantially as set forth.

2. The combination of a pair of adjoining rails, the ties or supports thereof, plates connecting the adjoining ends of the rails, and a longitudinal anticreeper-bar fastened to a plurality of the rail-supports and abutting at its end against said connecting-plate, substantially as set forth.

3. The combination of a series of rails, the ties or supports thereof, plates connecting the adjoining ends of the rails, and a longitudinal anticreeper-bar secured to a plurality of the ties, said bar extending from the connecting-plate of one rail-joint to the connecting-plate of the next joint and abutting at its ends against said plates, substantially as set forth.



4. The combination of a pair of adjoining rails, the ties or supports thereof, plates connecting the adjoining ends of the rails, a longitudinal anticreeper-bar fastened to a plurality of the rail-supports and abutting at its end against said connecting-plate, and means for fastening the anticreeper-bar to the portions of the rails between the ties, substantially as set forth.

5. The combination of a pair of adjoining rails, the ties or supports thereof, plates connecting the adjoining ends of the rails, and longitudinal anticreeper-bars arranged on opposite sides of the rails and secured to a plurality of the ties and abutting at their ends against said connecting-plates, substantially as set forth.

808,953. **FEED-GAGE.** LA ROY B. TAFT, Redcloud, Nebr. Filed May 25, 1905. Serial No. 262,296.

Claim.—1. A feed-gage consisting of upper and lower members, a lever mounted in a pair of upturned projections formed integral with said upper member, substantially as shown, a spring mounted on the rear portion of said upper member and engaging said lever, a lug also formed integral with said upper member and adapted to limit the action of said spring-pressure, said lever being adapted to engage the gripper-bar of a printing-press, substantially as and for the purpose described.

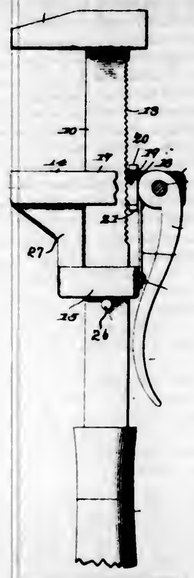
2. A feed-gage having upper and lower members, said members being adapted to receive a tympan-sheet between them, a sheet-metal clamp bent upon itself, having upper and lower members and adapted to receive said first-named members between them, substantially as described.

3. A feed-gage having a clamp provided with a shank, said shank being pivoted to the inner face of said feed-gage and capable of a horizontal swinging movement, whereby it is brought into and out of engagement with the feed-gage, substantially as described.

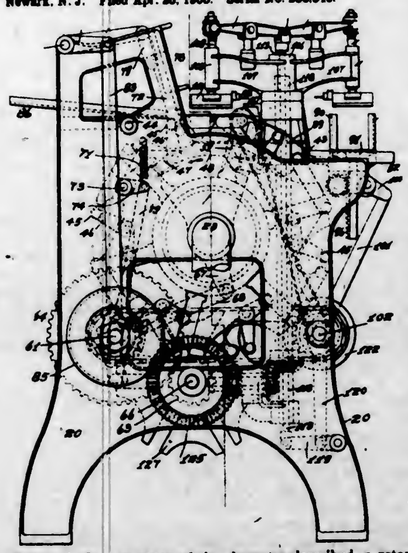
808,954. **WRENCH.** HARLIN T. THOMPSON, Floville, Ga., assignor of one-half to William D. Gibson, Fayetteville, Ga. Filed Sept. 20, 1904. Serial No. 225,261.

Claim.—A wrench consisting of a stock having spaced teeth in the rear face and with a handle at one end and a laterally-extending jaw at the other end, a movable jaw having spaced sides extending rearwardly of the same and slidably disposed upon opposite sides of the stock and projecting rearwardly of the same, a brace member depending from said movable jaw, a band extending from said brace member and inclosing said stock, a block slidably disposed between

the spaced sides of said movable jaw and with guide-ribs bearing above and below said sides, said block having spaced teeth for engaging the teeth of said stock, a cam pivoted between the projecting portions of the spaced sides of said movable jaw, and a spring connected to said block and operating to maintain the same yieldably out of engagement with said stock when released by the withdrawal of the cam.



808,955. **MACHINE FOR APPLYING LABELS AND THE LIKE TO BOTTLES AND OTHER ARTICLES.** BENJAMIN W. TUCKER, Newark, N. J. Filed Apr. 20, 1905. Serial No. 256,546.



Claim.—1. In a machine of the character described, a rotary frame carrying a series of independent rolling-beds spaced apart, and means for imparting intermittent motion to the same, combined with a stationary rolling belt or apron with which each of said beds in series coöperates and which is normally sufficiently slack to permit a loop to be formed therein to receive the article to be treated, the series of movable rollers carried by said frame for coöperation with said beds and belt or apron, means supporting said rollers, and means for holding said rollers in their closed position to maintain said loop during the rolling action; substantially as set forth

2. In a machine of the character described, a rotary frame carrying a series of rolling-beds, and means for imparting intermittent motion to the same, combined with a rolling belt or apron with which each of said beds in series coöperates and which is normally sufficiently slack to permit a loop to be formed therein to receive the article to be treated, means for forming said loop, means for applying a label or the like upon said belt or apron in advance of said loop, and means for maintaining said loop during the rolling action; substantially as set forth.

3. In a machine of the character described, a rotary frame carrying a series of rolling-beds, and means for imparting intermittent motion to the same, combined with a rolling belt or apron with which each of said beds in series coöperates and which is normally sufficiently slack to permit a loop to be formed therein to receive the article to be treated, means for forming said loop, means for holding a stack of labels or the like, a carrier adapted to convey said labels from said stack to said rolling belt or apron, means in the path of said carrier for applying a layer of paste thereto on its movement to said stack, means for detaching the label from the carrier when the same is to be taken by said belt or apron, and means for maintaining said loop during the rolling action; substantially as set forth.

4. In a machine of the character described, a rotary frame carrying a series of rolling-beds, and means for imparting intermittent motion to the same, combined with a rolling belt or apron with which each of said beds in series coöperates and which is normally sufficiently slack to permit a loop to be formed therein to receive the article to be treated, means for forming said loop, means for holding a stack of labels or the like, a carrier adapted to convey said labels from said stack to said rolling belt or apron, means in the path of said carrier for applying a layer of paste thereto on its movement to said stack, and pneumatic means for detaching the label from the carrier when the same is to be taken by said belt or apron, and means for maintaining said loop during the rolling action; substantially as set forth.

5. In a machine of the character described, a rotary frame carrying a series of rolling-beds, and means for imparting intermittent motion to the same, combined with a rolling belt or apron with which each of said beds in series coöperates and which is normally sufficiently slack to permit a loop to be formed therein to receive the article to be treated, means for forming said loop, means for holding a stack of labels or the like, a carrier adapted to convey said labels from said stack to said rolling belt or apron, means in the path of said carrier for applying a layer of paste thereto on its movement to said stack, and pneumatic means for detaching the label from the carrier when the same is to be taken by said belt or apron, and means for maintaining said loop during the rolling action, said carrier being formed of sections to be opened from one another when the label is to be removed therefrom so as to aid in the detachment of the label; substantially as set forth.

6. In a machine of the character described, a rotary frame carrying a series of rolling-beds, and means for imparting intermittent motion to the same, combined with a rolling belt or apron with which each of said beds in series coöperates and which is normally sufficiently slack to permit a loop to be formed therein to receive the article to be treated, the crank-arms carried by said frame for each bed and carrying a roller for closing the loop in the belt or apron, means for firmly holding said roller in its closed position to maintain the loop during the rolling action, and means for moving said roller to its open position at the conclusion of the rolling action; substantially as set forth.

7. In a machine of the character described, a rotary frame carrying a series of rolling-beds, and means for imparting intermittent motion to the same, combined with a rolling belt or apron with which each of said beds in series coöperates and which is normally sufficiently slack to permit a loop to be formed therein to receive the article to be treated, the crank-arms carried by said frame for each bed and carrying a roller for closing the loop in the belt or apron, a cam for locking said roller in its closed position to maintain the loop during the rolling action, and a cam for moving said roller to its open position at the conclusion of the rolling action; substantially as set forth.

8. In a machine of the character described, a rotary frame carrying a series of rolling-beds, and means for imparting intermittent motion to the same, combined with a rolling belt or apron with which each of said beds in series coöperates and which is normally sufficiently slack to permit a loop to be formed therein to receive the arti-

cle to be treated, the crank-arms carried by said frame for each bed and carrying a roller for closing the loop in the belt or apron, means for firmly holding said roller in its closed position to maintain the loop during the rolling action, means for moving said roller to its open position at the conclusion of the rolling action, and means for then forming the succeeding loop at the receiving end of said belt or apron and thus effecting the straightening out of the other end of said belt or apron and the discharge of the article therefrom; substantially as set forth.

9. In a machine of the character described, a rotary frame carrying a series of rolling-beds, and means for imparting intermittent motion to the same, combined with a rolling belt or apron with which each of said beds in series coöperates and which is normally sufficiently slack to permit a loop to be formed therein to receive the article to be treated, the crank-arms carried by said frame for each bed and carrying a roller for closing the loop in the belt or apron, a cam for locking said roller in its closed position to maintain the loop during the rolling action, a cam for moving said roller to its open position at the conclusion of the rolling action, and means for then forming the succeeding loop at the receiving end of said belt or apron and thus effecting the straightening out of the other end of said belt or apron and the discharge of the article therefrom; substantially as set forth.

10. In a machine of the character described, a rotary frame carrying a series of rolling-beds, and means for imparting intermittent motion to the same, combined with a rolling belt or apron with which each of said beds in series coöperates and which is normally sufficiently slack to permit a loop to be formed therein to receive the article to be treated, the crank-arms carried by said frame for each bed and carrying a roller for closing the loop in the belt or apron, springs connected with said crank-arms for drawing said rollers toward their respective rolling-beds, the toe and its actuating means for moving the roller of the bed below the belt or apron outwardly to permit the formation of said loop, a cam for locking said roller in its closed position to maintain the loop during the rolling action, a cam for moving said roller to its open position at the conclusion of the rolling action, and means for forming the loop in the belt or apron as the beds become successively positioned; substantially as set forth.

11. In a machine of the character described, a rotary frame carrying a series of rolling-beds, and means for imparting intermittent motion to the same, combined with a rolling belt or apron with which each of said beds in series coöperates and which is normally sufficiently slack to permit a loop to be formed therein to receive the article to be treated, means for maintaining said loop during the rolling action, and means for applying pneumatic pressure against the label or the like placed upon said belt or apron for holding the same during the rolling action; substantially as set forth.

12. In a machine of the character described, a rotary frame carrying a series of rolling-beds, and means for imparting intermittent motion to the same, combined with a rolling belt or apron with which each of said beds in series coöperates and which is normally sufficiently slack to permit a loop to be formed therein to receive the article to be treated, means for maintaining said loop during the rolling action, and means for applying air suction through the rolling beds and belt or apron for holding the label during the rolling action; substantially as set forth.

13. In a machine of the character described, a rotary frame carrying a series of rolling-beds, and means for imparting intermittent motion to the same, combined with a rolling belt or apron with which each of said beds in series coöperates and which is normally sufficiently slack to permit a loop to be formed therein to receive the article to be treated, means for maintaining said loop during the rolling action, and means for applying air suction through the rolling beds and belt or apron for holding the label during the rolling action, said belt or apron being perforated and said bed slotted; substantially as set forth.

14. In a machine of the character described, a rotary frame carrying a series of rolling-beds, and means for imparting intermittent motion to the same, combined with a rolling belt or apron with which each of said beds in series coöperates and which is normally sufficiently slack to permit a loop to be formed therein to receive the article to be treated, means for maintaining said loop during the rolling action, and means for applying air suction through the rolling beds and belt or apron for holding the label during the rolling action, said belt or apron and said beds having openings in them to permit the air suction action and the front edges of said tables having bellow rulers which also have air-openings; substantially as set forth.

15. In a machine of the character described, a rotary frame carrying a series of rolling-beds, and means for imparting intermittent motion to the same, combined with a rolling belt or apron with which each of said beds in series coöperates and which is normally sufficiently slack to permit a loop to be formed therein to receive the article to be treated, means for maintaining said loop during the rolling action, means for applying air suction through the belt or apron and the rolling-beds as the latter becomes successively positioned below said belt or apron for holding the label on the latter during the rolling action, and means for excluding the air suction from the beds until they become thus positioned; substantially as set forth.

16. In a machine of the character described, a rotary frame carrying a series of rolling-beds, and means for imparting intermittent motion to the same, combined with a rolling belt or apron with which each of said beds in series coöperates and which is normally sufficiently slack to permit a loop to be formed therein to receive the article to be treated, means for forming the loop in said belt or apron, means for depositing the label on said belt or apron in advance of said loop, means for maintaining said loop during the rolling action, and means for applying air suction through the belt or apron and the rolling-beds as successively positioned below the same for holding the label during the rolling action; substantially as set forth.

17. In a machine of the character described, a rotary frame carrying a series of rolling-beds, and means for imparting intermittent motion to the same, combined with a rolling belt or apron with which each of said beds in series coöperates and which is normally sufficiently slack to permit a loop to be formed therein to receive the article to be treated, means for forming the loop in said belt or apron, means for applying air suction through the belt or apron and the rolling-beds as successively positioned below the same for holding the label during the rolling action, the crank-arms carried by said frame for each bed and carrying a roller for closing the loop in the belt or apron, means for firmly holding said roller in its closed position to maintain the loop during the rolling action, and means for moving said roller to its open position at the conclusion of the rolling action; substantially as set forth.

18. In a machine of the character described, a rotary frame carrying a series of rolling-beds, and means for imparting intermittent motion to the same, combined with a rolling belt or apron with which each of said beds in series coöperates and which is normally sufficiently slack to permit a loop to be formed therein to receive the article to be treated, means for forming the loop in said belt or apron, means for applying air suction through the belt or apron and the rolling-beds as successively positioned below the same for holding the label during the rolling action, the crank-arms carried by said frame for each bed and carrying a roller for closing the loop in the belt or apron, a cam for locking said roller in its closed position to maintain the loop during the rolling action, and a cam for moving said roller to its open position at the conclusion of the rolling action; substantially as set forth.

19. In a machine of the character described, a rotary frame carrying a series of rolling-beds, and means for imparting intermittent motion to the same, combined with a rolling belt or apron with which each of said beds in series coöperates and which is normally sufficiently slack to permit a loop to be formed therein to receive the article to be treated, means for applying air suction through the belt or apron and the rolling-beds as successively positioned below the same for holding the label during the rolling action, the crank-arms carried by said frame for each bed and carrying a roller for closing the loop in the belt or apron, means for firmly holding said roller in its closed position to maintain the loop during the rolling action, means for moving said roller to its open position at the conclusion of the rolling action, and means for then forming the succeeding loop at the receiving end of said belt or apron and thus effecting the straightening out of the other end of said belt or apron and the discharge of the article therefrom; substantially as set forth.

20. In a machine of the character described, a rotary frame carrying a series of rolling-beds, and means for imparting intermittent motion to the same, combined with a rolling belt or apron with which each of said beds in series coöperates and which is normally sufficiently slack to permit a loop to be formed therein to receive the article to be treated, means for applying air suction through the belt or apron and the rolling-beds as successively positioned below the same for holding the label during the rolling action, the crank-arms carried by said frame for each bed and carrying a roller for closing the loop in the belt or apron, a cam for locking said roller in its closed position to maintain the loop during the rolling action, means for moving said roller to its open position at the conclusion of the rolling action, and means for then forming the succeeding loop at the receiving end of said belt or apron and thus effecting the straightening out of the other end of said belt or apron and the discharge of the article therefrom; substantially as set forth.

21. In a machine of the character described, a rotary frame carrying a series of rolling-beds, and means for imparting intermittent motion to the same, combined with a rolling belt or apron with which each of said beds in series coöperates and which is normally sufficiently slack to permit a loop to be formed therein to receive the article to be treated, means for supplying air suction through the belt or apron and the rolling-beds as successively positioned below the same for holding the label during the rolling action, the crank-arms carried by said frame for each bed and carrying a roller for closing the loop in the belt or apron, springs connected with said crank-arms for drawing said rollers toward their respective rolling-beds, the toe and its actuating means for moving the roller of the bed below the belt or apron outwardly to permit the formation of said loop, a cam for locking said roller in its closed position to maintain the loop during the rolling action, a cam for moving said roller to its open position at the conclusion of the rolling action, and means for forming the loop in the belt or apron as the beds become successively positioned; substantially as set forth.

22. In a machine of the character described, a rotary frame carrying a series of rolling-beds having openings therein and said frame being hollow and having a hub and containing partitions whereby air-chambers are provided for said beds, said hub being apertured for each of said chambers, a chambered sleeve supporting said frame and upon which it rotates and having an aperture to successively communicate with said chambers as said rolling-beds are successively positioned, means for exhausting the air through said chambered sleeve and said air-chambers as the latter are successively brought into communication with the chamber of said sleeve, and means for imparting intermittent rotary motion to said frame, combined with a perforated rolling belt or apron with which each of said beds successively coöperates and which is normally sufficiently slack to permit a loop to be formed therein to receive the article to be treated, and means for maintaining said loop during the rolling action; substantially as set forth.

23. In a machine of the character described, a rotary frame carrying a series of rolling-beds having openings therein and said frame being hollow and having a hub and containing partitions whereby air-chambers are provided for said beds, said hub being apertured for each of said chambers, a chambered sleeve supporting said frame and upon which it rotates and having an aperture to successively communicate with said chambers as said rolling-beds are successively positioned, means for exhausting the air through said chambered sleeve and said air-chambers as the latter are successively brought into communication with the chamber of said sleeve, and means for imparting intermittent rotary motion to said frame, combined with a perforated rolling belt or apron with which each of said beds successively coöperates and which is normally sufficiently slack to permit a loop to be formed therein to receive the article to be treated, means for forming said loop, means for applying a label or the like upon said belt or apron in advance of said loop, and means for maintaining said loop during the rolling action; substantially as set forth.

24. In a machine of the character described, a rotary frame carrying a series of rolling-beds having openings therein and said frame being hollow and having a hub and containing partitions whereby air-chambers are provided for said beds, said hub being apertured for each of said chambers, a chambered sleeve supporting said frame and upon which it rotates and having an aperture to successively communicate with said chambers as said rolling-beds are successively positioned, means for exhausting the air through said chambered sleeve and said air-chambers as the latter are successively brought into communication with the chamber of said sleeve, and means for imparting intermittent rotary motion to said frame, combined with a perforated rolling belt or apron with which each of said beds successively coöperates and which is normally sufficiently slack to permit a loop to be formed therein to receive the article to be treated, means for forming said loop, means for holding a stack of labels or the like, a carrier adapted to convey said labels from said stack to said rolling belt or apron, means in the path of said carrier for applying a layer of paste thereto on its movement to said stack, and means for maintaining said loop during the rolling action; substantially as set forth.

25. In a machine of the character described, a rotary frame carrying a series of rolling-beds having openings therein and said frame being hollow and having a hub and containing partitions whereby air-chambers are provided for said beds, said hub being apertured for each of said chambers, a chambered sleeve supporting said frame and upon which it rotates and having an aperture to successively communicate with said chambers as said rolling-beds are successively positioned, means for exhausting the air through said chambered sleeve and said air-chambers as the latter are successively brought into communication with the chamber of said sleeve, and means for imparting intermittent rotary motion to said frame, combined with a perforated rolling belt or apron with which each of said beds successively coöperates and which is normally sufficiently slack to permit a loop to be formed therein to receive the article to be treated, means for forming said loop, means for holding a stack of labels or the like, a carrier adapted to convey said labels from said stack to said rolling belt or apron, means in the path of said carrier for applying a layer of paste thereto on its movement to said stack, and means for maintaining said loop during the rolling action, said carrier being formed of sections to be opened from one another when the label is to be removed therefrom; substantially as set forth.

26. In a machine of the character described, a rotary frame carrying a series of rolling-beds having openings therein and said frame being hollow and having a hub and containing partitions whereby air-chambers are provided for said beds, said hub being apertured for each of said chambers, a chambered sleeve supporting said frame and upon which it rotates and having an aperture to successively communicate with said chambers as said rolling-beds are successively positioned, means for exhausting the air through said chambered sleeve and said air-chambers as the latter are successively brought into communication with the chamber of said sleeve, and means for imparting intermittent rotary motion to said frame, combined with a perforated rolling belt or apron with which each of said beds successively coöperates and which is normally sufficiently slack to permit a loop to be formed therein to receive the article to be treated, the crank-arms carried by said frame for each bed and carrying a roller for closing the loop in the belt or apron, means for firmly holding said roller in its closed position to maintain the loop during rolling action, and means for moving said roller to its open position at the conclusion of the rolling action; substantially as set forth.

27. In a machine of the character described, a rotary frame carrying a series of rolling-beds having openings therein and said frame being hollow and having a hub and containing partitions whereby air-chambers are provided for said beds, said hub being apertured for each of said chambers, a chambered sleeve supporting said frame and upon which it rotates and having an aperture to successively communicate with said chambers as said rolling-beds are successively positioned, means for exhausting the air through said chambered sleeve and said air-chambers as the latter are successively brought into communication with the chamber of said sleeve, and means for imparting intermittent rotary motion to said frame, combined with a perforated rolling belt or apron with which each of said beds successively coöperates and which is normally sufficiently slack to permit a loop to be formed therein to receive the article to be treated, the crank-arms carried by said frame for each bed and carrying a roller for closing the loop in the belt or apron, a cam for locking said roller in its closed position to maintain the loop during the rolling action, and a cam for moving said roller to its open position at the conclusion of the rolling action; substantially as set forth.

28. In a machine of the character described, a rotary frame carrying a series of rolling-beds having openings therein and said frame being hollow and having a hub and containing partitions whereby air-chambers are provided for said beds, said hub being apertured for each of said chambers, a chambered sleeve supporting said frame and upon which it rotates and having an aperture to successively communicate with said chambers as said rolling-beds are successively positioned, means for exhausting the air through said chambered sleeve and said air-chambers as the latter are successively brought into communication with the chamber of said sleeve, and means for imparting intermittent rotary motion to said frame, combined with a perforated belt or apron with which each of said beds successively coöperates and which is normally sufficiently slack to permit a loop to be formed therein to receive the article to be treated, the crank-arms carried by said frame for each bed and carrying a roller for closing the loop in the belt or apron, means for firmly holding said roller in its closed position to maintain the loop during the rolling action, means for moving said roller to its open position at the conclusion of the rolling action, and means for then forming the succeeding loop at the receiving end of said belt or apron and thus effecting the straightening out of the other end of said belt or apron and the discharge of the article therefrom; substantially as set forth.

29. In a machine of the character described, a rotary frame carrying a series of rolling-beds having openings therein and said frame being hollow and having a hub and containing partitions whereby air-chambers are provided for said beds, said hub being apertured for each of said chambers, a chambered sleeve supporting said frame

and upon which it rotates and having an aperture to successively communicate with said chambers as said rolling-beds are successively positioned, means for exhausting the air through said chambered sleeve and said air-chambers as the latter are successively brought into communication with the chamber of said sleeve, and means for imparting intermittent rotary motion to said frame, combined with a perforated rolling belt or apron with which each of said beds successively coöperates and which is normally sufficiently slack to permit a loop to be formed therein to receive the article to be treated, the crank-arms carried by said frame for each bed and carrying a roller for closing the loop in the belt or apron, a cam for locking said roller in its closed position to maintain the loop during the rolling action, a cam for moving said roller to its open position at the conclusion of the rolling action, and means for then forming the succeeding loop at the receiving end of said belt or apron and thus effecting the straightening out of the other end of said belt or apron and the discharge of the article therefrom; substantially as set forth.

30. In a machine of the character described, a rotary frame carrying a series of rolling-beds having openings therein and said frame being hollow and having a hub and containing partitions whereby air-chambers are provided for said beds, said hub being apertured for each of said chambers, a chambered sleeve supporting said frame and upon which it rotates and having an aperture to successively communicate with said chambers as said rolling-beds are successively positioned, means for exhausting the air through said chambered sleeve and said air-chambers as the latter are successively brought into communication with the chamber of said sleeve, and means for imparting intermittent rotary motion to said frame, combined with a perforated rolling belt or apron with which each of said beds successively coöperates and which is normally sufficiently slack to permit a loop to be formed therein to receive the article to be treated, the crank-arms carried by said frame for each bed and carrying a roller for closing the loop in the belt or apron, springs connected with said crank-arms for drawing said rollers toward their respective rolling-beds, the toe and its actuating means for moving the roller of the bed below the belt or apron outwardly to permit the formation of said loop, a cam for locking said roller in its closed position to maintain the loop during the rolling action, a cam for moving said roller to its open position at the conclusion of the rolling action, and means for forming the loop in the belt or apron as the beds become successively positioned; substantially as set forth.

31. In a machine of the character described, a rolling-bed, a rolling belt or apron, and means for maintaining the loop in said belt or apron during the rolling action, combined with carrier mechanism for depositing the labels, one after another, on said belt or apron, said mechanism comprising a turn-table frame having a laterally-extending arm, a plunger-rod mounted in said arm and having the carrier on its lower end, a pivoted lever connected at one end with said plunger for imparting vertical movement to the same, a rod connected with the other end of said lever with means for imparting vertical movement to the same, and means for turning said frame whereby to move the said carrier from the stack of labels to said belt or apron and then back to said stack; substantially as set forth.

32. In a machine of the character described, a rolling-bed, a rolling belt or apron, and means for maintaining the loop in said belt or apron during the rolling action, combined with carrier mechanism for depositing the labels, one after another, on said belt or apron, said mechanism comprising a turn-table frame having laterally-extending arms, plunger-rods mounted in said arms and having carriers on their lower ends, pivoted levers connected at their outer ends with said plungers for imparting simultaneous vertical movement to the same, an actuating-rod connected with the inner ends of said levers for operating the same, and means for turning said frame whereby to move one of said carriers from the stack of labels to said rolling belt or apron and the other carrier to said stack of labels; substantially as set forth.

33. In a machine of the character described, a rolling-bed, a rolling belt or apron, and means for maintaining the loop in the belt or apron during the rolling action, combined with a carrier composed of separable sections for conveying the labels, one after another, to and depositing the same upon said belt or apron, means for moving said carrier horizontally and also vertically, pasting means in the path of said carrier for applying a layer of paste thereto before it engages the label, and means for separating said sections at the time of the deposit of the label on the belt or apron for aiding in the detachment of the label; substantially as set forth.

34. In a machine of the character described, a rolling-bed, a rolling belt or apron, and means for maintaining the loop in the belt or apron during the rolling action, combined with a carrier composed of separable sections for conveying the labels, one after another, to and depositing the same upon said belt or apron, means for moving said carrier horizontally and also vertically, pasting means in the path of said carrier for applying a layer of paste thereto before it engages the label, means for separating said sections at the time of the deposit of the label on the belt or apron, and means for creating pneumatic pressure against said label for detaching the same from said carrier and holding the same against said belt or apron; substantially as set forth.

35. In a machine of the character described, a rolling-bed, a rolling belt or apron, and means for maintaining the loop in the belt or apron during the rolling action, combined with a carrier composed of separable sections for conveying the labels, one after another, to and depositing the same upon said belt or apron, means for moving said carrier horizontally and also vertically, pasting means in the path of said carrier for applying a layer of paste thereto before it engages the label, means for separating said sections at the time of the deposit of the label on the belt or apron, and means for creating air suction through said bed and belt or apron for drawing said label from said carrier and holding it upon said belt or apron, said belt or apron and said bed having openings therein to permit the suction action against said label; substantially as set forth.

36. In a machine of the character described, a rolling-bed, a rolling belt or apron, and means for maintaining the loop in said belt or apron during the rolling action, combined with a label-carrier having hinged sections geared together for conveying the labels, one after another, to and depositing the same upon said belt or apron, means for moving said carrier horizontally and also vertically, pasting means in the path of said carrier for applying a layer of paste thereto before it engages the label, an actuating-arm on one of said hinged sections, a fixed arm in the path of said actuating-arm when the carrier is lowered upon the belt or apron to engage the same and turn said hinged sections outwardly, and means for creating pneumatic pressure against said label for detaching the same from said carrier and holding the same against said belt or apron; substantially as set forth.

37. In a machine of the character described, a rolling-bed, a rolling belt or apron, and means for maintaining the loop in said belt or apron during the rolling action, combined with a label-carrier for conveying the labels to and depositing the same upon said belt or apron, means in the path of said carrier for applying a layer of paste thereto before it engages a label, and means for creating pneumatic pressure for detaching said label from the carrier and holding it upon said belt or apron; substantially as set forth.

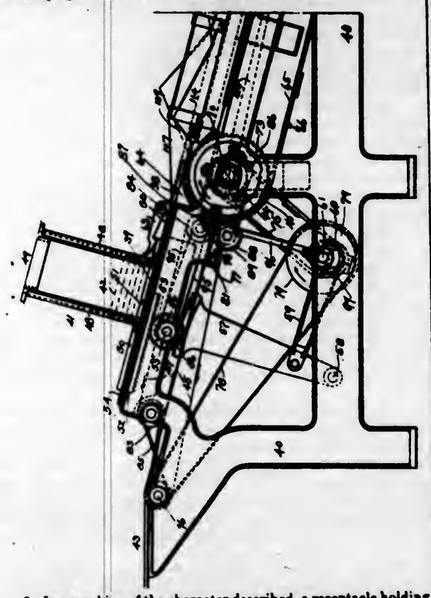
38. In a machine of the character described, a rolling-bed, a rolling belt or apron, and means for maintaining the loop in said belt or apron during the rolling action, combined with a label-carrier for conveying the labels to and depositing the same upon said belt or apron, means in the path of said carrier for applying a layer of paste thereto before it engages a label, and means for creating air suction through said belt or apron and bed for drawing the label from said carrier and holding it upon said belt or apron, said belt or apron and said bed having openings therein to permit the suction action against said label; substantially as set forth.

39. In a machine of the character described, a rolling-bed having openings therein, a hollow roller at the receiving end of said bed and having openings in its walls, a perforated rolling belt or apron upon said bed, and means for creating air suction through said bed, roller and apron, combined with means for forming a loop in said belt or apron adjacent to said hollow roller, means for closing said loop around the article to be treated, and means for maintaining said loop during the rolling action; substantially as set forth.

40. In a machine of the character described, a rolling-bed having openings therein, a hollow roller at the receiving end of said bed and having openings in its walls, a perforated rolling belt or apron upon said bed, and means for creating air suction through said bed, roller and apron, combined with means for forming a loop in said belt or apron adjacent to said hollow roller, means for closing said loop around the article to be treated, means for maintaining said loop during the rolling action, and means for opening said loop at the conclusion of such action; substantially as set forth.

808,956. MACHINE FOR APPLYING WRAPPERS TO MAGAZINES, BOOKS, AND THE LIKE. BENJAMIN W. TUCKER, Newark, N. J. Filed Aug. 23, 1905. Serial No. 275,268.

Claim.—1. In a machine of the character described, means for feeding the books, and means for feeding the wrappers thereto, combined with a set of folders in the path of the book and wrapper, means for moving the book and wrapper along said path and against said folders, and means for applying paste to one edge of the wrapper during such passage, said folders comprising means for opening the book, means for folding the short flap of the wrapper into the open book, means for folding the long flap of the wrapper across the book, and means for folding the projecting end of said long flap around under and up against the book; substantially as set forth.



2. In a machine of the character described, a receptacle holding a stack of the books, a sliding bottom therefor for pushing the books one after another from the bottom of the stack, means for feeding the wrappers to the books pushed from the stack, and means for insuring the registry of the wrappers with relation to the books, combined with a set of folders in the path of the book and wrapper, means for moving the book and wrapper along said path and against said folders, and means for applying paste to one edge of the wrapper during such passage, said folders comprising means for opening the book, means for folding the short flap of the wrapper into the open book, means for folding the long flap of the wrapper across the book, and means for folding the projecting end of said long flap around under and up against the book; substantially as set forth.

3. In a machine of the character described, a receptacle for holding a stack of the books, a sliding bottom therefor having a shoulder on its upper surface to engage and push a book from the bottom of the stack, means for stripping such book from said bottom on the return of the latter, a table for supporting such book after leaving said bottom and along which the book may be pushed by the end of said bottom on its next succeeding outward movement, and means for feeding the wrappers to the books pushed to position by the end of said bottom, combined with a set of folders in the path of the book and wrapper, means for moving the book and wrapper along said path and against said folders, and means for applying paste to one edge of the wrapper during such passage, said folders comprising means for opening the book, means for folding the short flap of the wrapper into the open book, means for folding the long flap of the wrapper across the book, and means for folding the projecting end of said long flap around under and up against the book; substantially as set forth.

4. In a machine of the character described, a receptacle for holding a stack of the books, a sliding bottom therefor having a shoulder on its upper surface to engage and push a book from the bottom of the stack, a pair of pivoted dogs for engaging the book at said shoulder and stripping the same from said bottom on the return of the latter, a table for supporting such book after leaving said bottom and along which the book may be pushed by the end of said bottom on its next succeeding outward movement, and means for feeding the wrappers to the books pushed to position by the end of said bottom, combined with a set of folders in the path of the book and wrapper, means for moving the book and wrapper along said path and against said folders, and means for applying paste to one edge of the wrapper during such passage, said folders comprising means for opening the book, means for folding the short flap of the wrapper into the open book, means for folding the long flap of the wrapper across the book, and means for folding the projecting end of said long flap around under and up against the book; substantially as set forth.

5. In a machine of the character described, means for feeding the books, means for feeding the wrappers to a registry position, a suction-drum for conveying the wrappers as registered to said books, and means for delivering the wrappers as registered to said drum, combined with a set of folders in the path of the book and wrapper, means for moving the book and wrapper along said path and against said folders, and means for applying paste to one edge of the wrapper during such passage, said folders comprising means for opening the book, means for folding the short flap of the wrapper into the open book, means for folding the long flap of the wrapper across the book, and means for folding the projecting end of said long flap around under and up against the book; substantially as set forth.

6. In a machine of the character described, means for feeding the books, the upper and lower series of belts for feeding the wrappers, the registry-dogs upon which the wrappers are fed, a pair of rollers for closing against the wrappers on said dogs, means for moving said dogs to release the wrappers when said rollers act, an inclined table upon which said rollers move the wrappers as registered, and a suction-drum which takes the wrappers from said table and conveys them to said books, combined with a set of folders in the path of the book and wrapper, means for moving the book and wrapper along said path and against said folders, and means for applying paste to one edge of the wrapper during such passage, said folders comprising means for opening the book, means for folding the short flap of the wrapper into the open book, means for folding the long flap of the wrapper across the book, and means for folding the projecting end of said long flap around under and up against the book; substantially as set forth.

7. In a machine of the character described, means for feeding the books, and a suction-drum for conveying the wrappers in accurate registry to said books, combined with a set of folders in the path of the book and wrapper, means for moving the book and wrapper along said path and against said folders, and means for applying paste to one edge of the wrapper during such passage, said folders comprising means for opening the book, means for folding the short flap of the wrapper into the open book, means for folding the long flap of the wrapper across the book, and means for folding the projecting end of said long flap around under and up against the book; substantially as set forth.

8. In a machine of the character described, a suction-drum for conveying the wrappers to the books as the latter are positioned, said drum having means for cutting off the air suction from the wrapper as the latter reaches a certain point, combined with a set of folders in the path of the book and wrapper, means for moving the book and wrapper along said path and against said folders, and means for applying paste to one edge of the wrapper during such passage, said folders comprising means for opening the book, means for folding the short flap of the wrapper into the open book, means for folding the long flap of the wrapper across the book, and means for folding the projecting end of said long flap around under and up against the book; substantially as set forth.

9. In a machine of the character described, a suction-drum for conveying the wrappers to the books as the latter are positioned, said drum containing the partitions which confine the air suction to a limited section of said drum represented by the travel of the wrappers, combined with a set of folders in the path of the book and wrapper, means for moving the book and wrapper along said path and against said folders, and means for applying paste to one edge of the wrapper during such passage, said folders comprising means for opening the book, means for folding the short flap of the wrapper into the open book, means for folding the long flap of the wrapper across the book, and means for folding the projecting end of said long flap around under and up against the book; substantially as set forth.

10. In a machine of the character described, a suction-drum for conveying the wrappers to the books as the latter are positioned, and sprocket-chains mounted to travel on said drum and having toes to engage the rear edge of the book and wrapper and effect the passage of the same together through the machine, combined with a set of folders in the path of the book and wrapper, and means for applying paste to one edge of the wrapper during such passage, said folders

comprising means for opening the book, means for folding the short flap of the wrapper into the open book, means for folding the long flap of the wrapper across the book, and means for folding the projecting end of said long flap around under and up against the book; substantially as set forth.

11. In a machine of the character described, a suction-drum for conveying the wrappers to the books as the latter are positioned, sprocket-chains mounted to travel on said drum and having toes to engage the rear edge of the book and wrapper and effect the passage of the same together through the machine, and belts also mounted to travel on said drum and adapted to support the wrapper and book while the same are traveling through the machine, combined with a set of folders in the path of the book and wrapper, and means for applying paste to one edge of the wrapper during such passage, said folders comprising means for opening the book, means for folding the short flap of the wrapper into the open book, means for folding the long flap of the wrapper across the book, and means for folding the projecting end of said long flap around under and up against the book; substantially as set forth.

12. In a machine of the character described, means for receiving a wrapper with a book thereon and adapted to effect the passage of the same together through the machine, combined with a set of folders in the path of the book and wrapper, and means for applying paste to one edge of the wrapper during such passage, said folders comprising means for opening the book, means for folding the short flap of the wrapper into the open book, means for folding the long flap of the wrapper across the book, and means for folding the projecting end of said long flap around under and up against the book; substantially as set forth.

13. In a machine of the character described, means for receiving a wrapper with a book thereon and adapted to effect the passage of the same together through the machine, combined with a set of folders in the path of the book and wrapper and comprising means for opening the book, means for folding the short flap of the wrapper into the open book, means for folding the long flap of the wrapper across the book, and means for folding the projecting end of said long flap around under and up against the book; substantially as set forth.

14. In a machine of the character described, means for receiving a wrapper with a book thereon and adapted to effect the passage of the same together through the machine, combined with a set of folders in the path of the book and wrapper and comprising an advance inclined blade 107 for opening the book and a succeeding section 113 for holding the book open during a certain period, an inclined blade 108 for turning the short flap of the wrapper upwardly and a blade 114 for folding said flap inwardly and down into the open book, an inclined blade 109 for turning the long flap of the wrapper upwardly and a blade 115 for turning the same inwardly and downwardly across the book, a blade 119 for turning the projecting end of said long flap downwardly, and a blade 122 for then turning said end upwardly and inwardly below the book; substantially as set forth.

15. In a machine of the character described, a receptacle for holding a stack of the books or other articles, a sliding bottom therefor having a shoulder on its upper surface to engage and push an article from the bottom of the stack, means for stripping such article from said bottom on the return of the latter, a table for supporting such article after leaving said bottom and along which the article may be pushed by the end of said bottom on its next succeeding outward movement, and means for feeding the wrappers to the articles pushed to position by the end of said bottom, combined with a set of folders in the path of the article and wrapper, and means for moving the article and wrapper along said path and against said folders, said folders comprising means for folding the wrapper upon the article; substantially as set forth.

16. In a machine of the character described, means for feeding the articles to be wrapped, means for feeding the wrappers to a registry position, a suction-drum for conveying the wrappers as registered to said articles, and means for delivering the wrappers as registered to said drum, combined with a set of folders in the path of the article and wrapper, and means for moving the article and wrapper along said path and against said folders, said folders comprising means for folding the wrapper upon the article; substantially as set forth.

17. In a machine of the character described, means for feeding the articles to be wrapped, the upper and lower series of belts for feeding the wrappers, the registry-dogs upon which the wrappers are fed, a pair of rollers for closing against the wrappers on said dogs, means for moving said dogs to release the wrappers when said rollers act, an inclined table upon which said rollers move the wrappers as registered, and a suction-drum which takes the wrappers from said table and conveys them to said articles, combined with a set of folders in the path of the article and wrapper, and means for moving the article and wrapper along said path and against said folders, said folders comprising means for folding the wrapper upon the article; substantially as set forth.

18. In a machine of the character described, means for feeding the articles to be wrapped, and a suction-drum for conveying the wrappers in accurate registry to said articles, combined with a set of folders in the path of the article and wrapper, and means for moving the article and wrapper along said path and against said folders, said folders comprising means for folding the wrapper upon the article; substantially as set forth.

19. In a machine of the character described, a suction-drum for conveying the wrappers to the articles to be wrapped as the latter are positioned, said drum having means for cutting off the air suction from the wrapper as the latter reaches a certain point, combined with a set of folders in the path of the article and wrapper, and means for moving the article and wrapper along said path and against said folders, said folders comprising means for folding the wrapper upon the article; substantially as set forth.

20. In a machine of the character described, a suction-drum for conveying the wrappers to the articles to be wrapped as the latter are positioned, said drum containing the partitions which confine the air suction to a limited section of said drum represented by the travel of the wrappers, combined with a set of folders in the path of the article and wrapper, and means for moving the article and wrapper along said path and against said folders, said folders comprising means for folding the wrapper upon the article; substantially as set forth.

21. In a machine of the character described, a suction-drum for conveying the wrappers to the articles to be wrapped as the latter are positioned, and sprocket-chains mounted to travel on said drum and having toes to engage the rear edge of the article and wrapper and effect the passage of the same together through the machine, combined with a set of folders in the path of the article and machine, and means for applying paste to one edge of the wrapper during such passage, said folders comprising means for folding the wrapper upon the article; substantially as set forth.

22. In a machine of the character described, a suction-drum for conveying the wrappers to the articles to be wrapped as the latter are positioned, sprocket-chains mounted to travel on said drum and having toes to engage the rear edge of the article and wrapper and effect the passage of the same together through the machine, and belts also mounted to travel on said drum and adapted to support the wrapper and article while the same are traveling through the machine, combined with a set of folders in the path of the article and wrapper, and means for applying paste to one edge of the wrapper during such passage, said folders comprising means for folding the wrapper upon the article; substantially as set forth.

808,957. CIRCUIT-CONTROLLER. RICHARD VARLEY, Englewood, N. J., assignor, by mesne assignments, to The Autocoil Co., a Corporation of New Jersey. Filed Oct. 31, 1904. Serial No. 230,698.

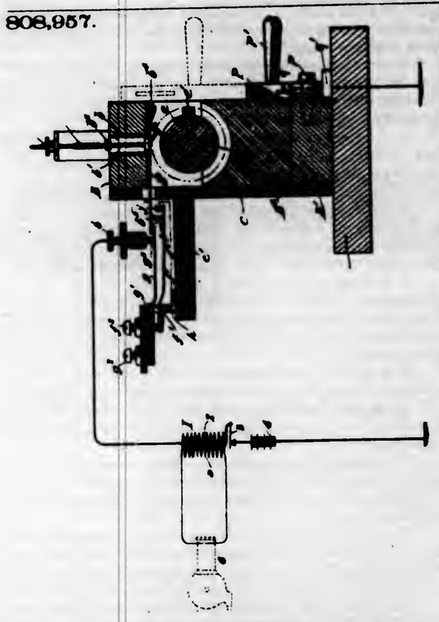
Claim.—1. The combination of a permanent magnet, a rotary shaft carrying a block of iron tending to close the magnetic circuit of said magnet and a circuit-controlling lever interposed between a pole of said magnet and said block of iron.

2. The combination of an explosive-engine, a circuit controlling the ignition of the charge therein, a circuit-closer in said circuit and actuated by the engine a circuit-breaker also in said circuit and adapted to be actuated after the circuit-closer is actuated and means whereby the period during which the circuit remains closed is substantially independent of the speed of the engine.

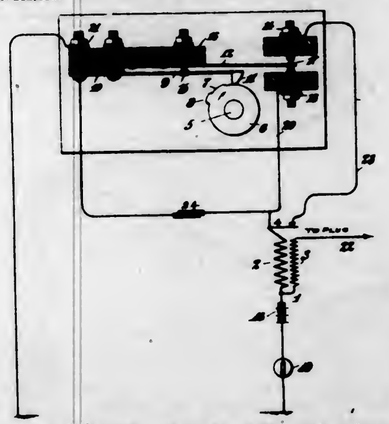
3. The combination of a shaft, a magnet whose poles embrace said shaft, a body of iron carried by said shaft and rotating in the space between said poles, a circuit-controlling element carrying an armature subjected to the magnetic influence of said body of iron intermittently by the rotations of the shaft and a circuit controlled by said element.

4. A circuit-controller comprising a magnet and a movable element subject to the attraction of said magnet, means for moving the magnet periodically into attractive range of said element, a pair of contacts adapted to be brought together when said element is moved by the magnet, a second movable element adapted to be moved by the first after the first has brought said contacts together, and a second pair of contacts adapted to be separated when said second movable element is moved, said two pairs of contacts being in series with each other, substantially as described.

808,957.



808,958. SPARK-IGNITION SYSTEM FOR EXPLOSIVE-ENGINES. RICHARD VARLEY, Englewood, N. J., assignor to The Autocoil Company, a Corporation of New Jersey. Filed Mar. 28, 1905. Serial No. 252,488.



Claim.—1. In an ignition system for explosion-engines, the combination of an induction-coil, an igniting device, and means whereby according to the speed of the engine a single spark or a series of sparks will be created at the igniting device.

2. In an ignition system for explosion-engines, an induction-coil, a vibratory circuit-controller and a single make-and-break circuit-controller therefor, and means dependent upon the speed of the engine for determining which of said circuit-controllers shall produce the ignition of the charge.

3. In an ignition system for explosion-engines, the combination of a primary circuit including a vibrator and a branch of the primary circuit shunting the vibrator, a circuit-controlling device adapted to close said circuit and branch successively and an engine-shaft actuating said circuit-controller.

4. In an ignition system for explosion-engines, the combination of a primary circuit including a vibrator and a branch of the primary circuit shunting the vibrator, a circuit-controller adapted to close said circuit and branch successively and a compound cam adapted to actuate said circuit-controller.

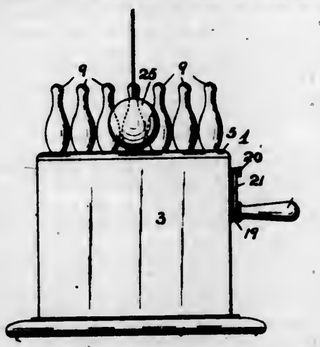
5. In an ignition system for explosion-engines, the combination of an induction-coil, a vibrator, and two circuit-controllers with means for actuating them in succession, one circuit-controller adapted to control the primary circuit of the induction-coil independent of the vibrator, and the other adapted to control a circuit including the primary and the vibrator, for the purpose set forth.

6. In an ignition system for explosion-engines the combination of an induction-coil, a vibrator, and two circuit-controllers with means for actuating them in succession, one circuit-controller adapted to control the primary circuit of the induction-coil independent of the vibrator, and the other adapted to control a circuit including the primary and the vibrator, and means for holding one circuit closed longer than the other.

7. In an ignition system for explosion-engines, the combination of an induction-coil, two circuits each including the primary winding of said coil, a circuit-controlling device adapted to control both of said circuits and an engine-shaft adapted to actuate the controlling device so as to break one circuit and complete the other in succession.

8. In an ignition system for explosion-engines, the combination of an induction-coil, two circuit branches each including the primary winding of said coil, a circuit-controller adapted to control both of said branches, and means whereby one of said branches will be broken and the other completed in succession at each period of ignition of a charge.

808,959. GAME APPARATUS. EVA B. VINSON and BENJAMIN F. ROBINSON, Newark, N. J. Filed Mar. 16, 1905. Serial No. 250,330.



Claim.—1. In a game apparatus, a hollow base provided with sides and a top, one of said sides being provided with a slot, a set of pins adapted to be set up upon said top, a swinging plate journaled within the said base, a means of connection between the said plate and each pin, and an actuating means connected with said plate and extending from the slot in the side of the base for actuating said swinging plate, and by means of said plate and the means of connection between the same and the pins setting up the fallen pins when said plate-actuating means is operated, substantially as and for the purposes set forth.

2. In a game apparatus, a hollow base provided with sides and a top, one of said sides being provided with a slot, a set of pins adapted to be set up upon said top, a swinging plate journaled within the said base, a means of connection between the said plate and each pin, a shank extending from the said swinging plate said shank being movable in said slot, and an actuating-rod on said shank for actuating the said swinging plate, and by means of said plate and the means of connection between the same and the pins setting up the fallen pins when said actuating-rod is operated, substantially as and for the purposes set forth.

3. In a game apparatus, a hollow base provided with sides and a top, one of said sides being provided with a slot, and the said top being provided with a series of holes or perforations, a set of pins adapted to be set up upon said top, a swinging plate journaled near its rear edge within the said base, a series of rollers also journaled within said base, flexible cords or strings arranged over said rollers and extending through the holes or perforations in said top, said cords or strings being secured to the front edge of said swinging

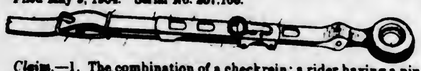
plate and said pins, and an actuating means connected with said plate for actuating said plate, and by means of the said cords or strings setting up the fallen pins, substantially as and for the purposes set forth.

4. In a game apparatus, a hollow base provided with sides and a top, one of said sides being provided with a slot, and the said top being provided with a series of holes or perforations, a set of pins adapted to be set up upon said top, a swinging plate journaled near its rear edge within the said base, a series of rollers also journaled within said base, flexible cords or strings arranged over said rollers and extending through the holes or perforations in said top, said cords or strings being secured to the front edge of said swinging plate and said pins, a shank extending from the said swinging plate said shank being movable in said slot, an actuating-rod on said shank for actuating said swinging plate, and by means of the said cords or strings setting up the fallen pins, and an elastic band between said plate-actuating rod and the side of the base, for returning said swinging plate to its normal initial position, substantially as and for the purposes set forth.

808,960. VISE-SLIDE. ELI M. WALKER, Meriden, Conn., assignor to the Charles Parker Company, Meriden, Conn., a Corporation of Connecticut. Filed Dec. 13, 1904. Serial No. 236,594.

Claim.—A vise-slide having a longitudinal opening therethrough and a strengthening-bar embedded in the slide above and having an exposed lower edge which forms a portion of the wall of the longitudinal opening, the said bar extending under the jaw portion of the slide whereby the slide is reinforced throughout the portion subjected to strain.

808,961. CHECKREIN. WILLIAM WILLIAMSON, Saginaw, Mich. Filed May 9, 1904. Serial No. 207,106.



Claim.—1. The combination of a checkrein; a rider having a pin at its rear end engaging a loop formed in the checkrein by folding the end of the checkrein back upon itself; a catch carried by said rider; a tongue carrying a ring at its rear end and having openings in its upper surface, said tongue being slidably mounted between said rider and the looped end of the checkrein, substantially as described.

2. In combination with a checkrein having a rider at its lower end; a catch pivotally mounted on said rider, said catch being formed with one end upwardly beveled; a tongue slidably mounted beneath said catch, and having openings to engage therewith, substantially as described.

3. The combination of a checkrein; a rider having a pin at its rear end engaging a loop formed in the checkrein by folding the end of the checkrein back upon itself; a catch carried by said rider; a tongue carrying a ring at its rear end and having openings in its upper surface, said tongue being slidably mounted between said rider and the looped end of the checkrein; together with a buckle having a sliding loop formed integral therewith, substantially as described.

808,962. DISPLAY RACK OR STAND. HENRY M. WILLIS, East Williston, N. Y. Filed Mar. 10, 1904. Renewed June 5, 1905. Serial No. 263,869.

Claim.—1. A display-rack consisting of four body portions, means for loosely hinging said portions together to produce a rectangular rack and render them capable of being collapsed upon each other into flat form, and means carried by the rack for sustaining the same in display condition.

2. A collapsible display-rack consisting of a rectangular portion and an extended back, the top of the rectangular portion being provided with means for holding the articles to be displayed, and means for supporting the rack in display condition.

3. A collapsible display-rack consisting of a back portion, a top and a bottom portion each hinged to the back portion, and a front portion hinged to the top and bottom portions, and means for sustaining the several hinged portions in fixed relation to each other.

4. A collapsible display-rack consisting of a plurality of hinged portions forming a substantially rectangular body portion with an extended back, and a support hinged so as to swing within the body portion and support the rack in display condition.

5. A display-rack comprising a plurality of body portions, means for loosely hinging said portions together to render them capable of being collapsed upon each other into flat form, and means carried by one of said hinged portions for sustaining the rack in display condition.

6. A display-rack comprising a plurality of body portions, means for loosely hinging said portions together to render them capable of being collapsed upon each other into flat form, and a support hinged to one of said portions for sustaining the rack in display condition.

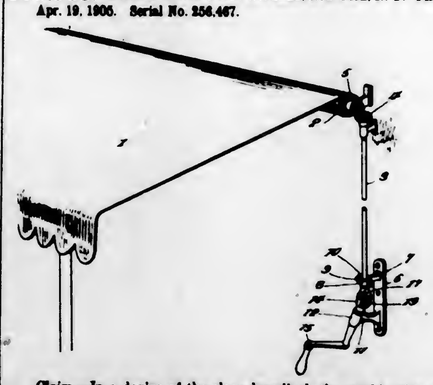
7. A collapsible display-rack comprising a plurality of body portions loosely hinged together and one of said portions being extended to form a back, and means for sustaining the rack in display condition.

8. A collapsible display-rack comprising a plurality of body portions hinged together and one of said portions being extended to form a back, and one of the said portions being provided with a hinged support for sustaining the rack in display condition.

9. A display-rack consisting of a plurality of individual body portions loosely hinged together to render them capable of being collapsed upon each other into flat form, and means for sustaining the parts in display condition.

10. A display-rack comprising a plurality of individual body portions, means for loosely hinging said parts together to render them capable of being collapsed upon each other into flat form in either of two directions, and means for sustaining the rack in display condition.

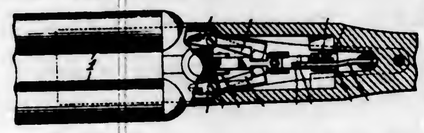
808,963. AWNING. AUGUST F. WINBERG, New York, N. Y. Filed Apr. 19, 1905. Serial No. 256,467.



Claim.—In a device of the class described, the combination of the awning 1, the roller 2, the main shaft 3, the intermeshing pinions 4 and 5, the bracket 6, the lugs 7 projected from the bracket and forming a bearing for the shaft 3, the arm 11 projected from the bracket and having the inclined tubular head 12, the crank-shaft 13 mounted in the head 12, the universal connection 14 between the shafts 3 and 13, the crank-handle 15, and the set-screw 16 carried by the head 12 and adapted to engage the crank-shaft for the purpose specified.

808,964. FIRING MECHANISM FOR FIREARMS. GUSTAV B. WITTERSHEIM, Hartford, Conn., assignor to Remington Arms Company, Inc., N. Y., a Corporation of New York. Filed Apr. 20, 1904. Serial No. 204,213.

Claim.—1. In a multibarrel firearm having a plural number of hammers, sears, and their appurtenant parts, a trigger, hammer-controlled coupling means intermediate the sears and trigger for automatically coupling one of said sears to the other after the operation of the first of said sears, and a fluid-controlled means operatively arranged with reference to said trigger but normally disconnected therefrom and adapted to temporarily prevent the action of the automatic sear-coupling means.



2. In a multibarrel firearm having a plural number of hammers, sears, and their appurtenant parts, a trigger, means intermediate the sears and trigger including pivoted hammer-controlled couplers for automatically coupling said sears after the operation of either one of said sears, and a fluid-resist operatively arranged with relation to said trigger to temporarily prevent the action of the automatic sear-coupling means, said fluid-resist being normally disconnected from said trigger.

3. In a multibarrel firearm having a plural number of hammers, sears, and their appurtenant parts, a trigger, a coupler pivoted on each of the sears and controlled by the position of the hammer, and a fluid-resist normally disconnected from though operatively arranged with reference to the trigger and adapted for temporarily preventing the coupling action of the pivoted couplers.

4. In a multibarrel firearm having a plural number of hammers and sears and appurtenant parts, a trigger, a pivoted coupler mounted upon each of the sears and controlled by the position of its hammer, a lever appurtenant to and normally disconnected from the trigger, and a fluid-resist operatively arranged with reference to the lever and adapted to temporarily prevent the coupling action of the couplers, during the connection of the trigger and lever.

5. In a multibarrel firearm having a plural number of hammers, sears and their appurtenant parts, a trigger, a pivoted coupler mounted upon each sear and controlled in its coupling action by its respective hammer, means intermediate the sears and trigger and cooperating with the couplers for operating either of said sears after the operation of the other of said sears, a pivoted lever, interengaging parts between one end of the lever and the trigger, a cylinder operatively mounted with reference to the lever, a piston fitting said cylinder, and interengaging connections between said piston and one end of the lever.

6. In a multibarrel firearm having a plural number of hammers, sears, and their appurtenant parts, a trigger, means intermediate the sears and trigger for automatically connecting one of said sears for operation after the operation of the other of said sears, a recess formed in the trigger, a pin projecting from said recess, a bifurcated lever engaging said pin, a support for the lever, a piston operatively connected with the opposite end of said lever, a cylinder surrounding the piston, and a valve for varying the action of the piston with reference to the cylinder.

7. In a multibarrel firearm having a plural number of hammers, sears and appurtenant parts, a trigger, means intermediate the sears and trigger for automatically connecting one of said sears after the operation of the other of said sears, a fluid-resist operatively arranged with reference to but normally disconnected from the trigger and comprising a piston and cylinder, and a valve extending through the upper tang to the cylinder for varying the action of the fluid-resist with reference to the trigger during connection of the parts.

8. In a multibarrel firearm having a plural number of hammers, sears and appurtenant parts, a trigger, means intermediate the sears and trigger for automatically connecting one of said sears after the operation of the other of said sears, a lever loosely connected with the trigger at one end and engaged at its opposite end by a movable piston, a cylinder surrounding said piston, and a valve projecting through the upper tang appurtenant thereto for varying the action of said piston.

9. In a multibarrel firearm having a plural number of hammers, sears and appurtenant parts, a pivoted coupler mounted upon each sear, a trigger, means intermediate the sears and trigger including the pivoted couplers for operating one of said sears after the operation of the other of said sears, means for resisting the normal action of the trigger comprising a cylinder and piston, and a valve for regulating the action of the latter in the former, and a spring arranged within the piston.

10. In a multibarrel firearm having a plural number of hammers, sears and their appurtenant parts, a trigger, means intermediate the sears and trigger for automatically coupling one of said sears for releasing action with respect to its hammer after the operation of the other of said sears, a pin arranged upon the trigger, a lever having a bifurcated end normally disengaged from said pin, and means for retarding the action of said lever upon its connection with the trigger.

11. In a multibarrel firearm having a plural number of hammers, sears and their appurtenant parts, a trigger, means intermediate the sears and trigger for automatically connecting for operation one of said sears after the operation of the other of said sears, a retarding-lever operatively arranged with reference to the trigger and having a bifurcated end, a cam-surface arranged upon one side of the bifurcation, a pin in the trigger normally disconnected from the lever and coöperating with said cam-surface, and fluid means for retarding the lever.

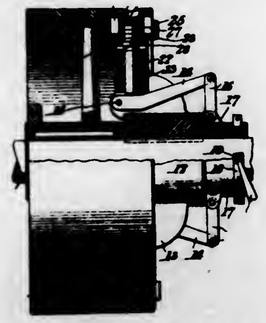
12. In a multibarrel firearm having a plural number of hammers, sears and appurtenant parts, a trigger, a pivoted hammer-controlled coupler mounted upon each of the sears, a shiftable block borne by the trigger and underlying said sears, a pivoted lever mounted independently of the trigger and arranged to be tilted thereby, an air-piston connected with one end of said lever and a spring operatively arranged with respect to said piston substantially as set forth.

13. In a multibarrel firearm having a plural number of hammers, sears and appurtenant parts, a trigger, a pivoted hammer-controlled coupler mounted upon each of the sears, a shiftable block borne by the trigger and underlying said sears, a pivoted lever mounted independently of the trigger and arranged to be tilted thereby, a tubular air-piston connecting with one end of said lever and a spring arranged within said piston substantially as set forth.

14. In a multibarrel firearm having a plural number of hammers, sears and appurtenant parts, means intermediate the trigger and sears whereby either of the hammers may be released by the single trigger, a recess formed in the gun-stock, a cylinder located in said recess and supported by the gun-stock, a piston fitting said cylinder, a lever pivoted independently of the trigger and normally disconnected therefrom, said lever having one end in operative engagement with the piston, whereby said piston will be moved by and will control said lever upon interengagement of the trigger and lever.

15. In a multibarrel firearm having a plural number of hammers, sears and appurtenant parts, a trigger, means intermediate the trigger and sears, whereby either hammer may be released by the single trigger, a cylinder inserted through the gun-stock, a piston arranged to move in said cylinder and having an anti-friction bearing connection with a lever, the pivoted lever engaging said piston through the antifriction-bearing, and with its opposite end normally disconnected from the trigger and arranged to connect the trigger and piston for retarding the movements of the trigger when said trigger is actuated to release either of the hammers.

808,965. CLUTCH. ROY L. WOODARD, Richburg, N. Y. Filed Jan. 31, 1905. Serial No. 243,623.

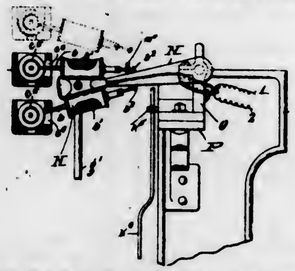


Claim.—1. The combination in a clutch, of a shaft, a loose pulley mounted thereon and having a perforated rib, a collar rigidly secured to the shaft, a plurality of arms projecting from the collar and provided with laterally-extended brackets, radially-movable pins guided by the arms and provided at their outer ends with tool-engaging surfaces accessible through the perforations of the pulley-rim, said pins being provided with peripheral threads, clutching-shoes having threaded openings for the reception of the threaded portions

of the pins and provided with lugs engaging said brackets to prevent independent turning movement of the shoes, said pins being independently adjustable with relation to the shoes to which they are attached, clamping-nuts mounted on the pins for holding the shoes in adjusted position, friction-blocks carried by the shoes, and means for operating the pins.

2. The combination in a clutch, of a shaft, a pulley loose on the shaft, a collar rigid with the shaft, an arm projecting from said collar and provided with a guiding-slot, an operating-lever disposed within the slot and pivoted to the arm, a radially-movable pin supported by the arm and engaging the lever, said pin having a recessed outer end, a clutching-shoe having edge flanges and provided with a central boss having a threaded opening for the reception of the threaded outer end of the pin, there being an opening in the pulley-rim for the insertion of a tool into the recess of said rim, a jam-nut carried by the threaded portion of the pin, brackets extending laterally from the arm and provided with guiding-openings, lugs or flanges depending from the shoe and held between said brackets, pins extending through the guiding-opening of the brackets and having a threaded connection with the shoes, compression-springs mounted on said pins, and nuts carried by the inner threaded ends of said pins for adjusting the stress of the springs.

808,966. **WEFT-REPLENISHING LOOM.** HORACE W. WYMAN, Worcester, Mass.; Mary H. Wyman administratrix of said Horace W. Wyman, deceased. Filed May 11, 1905. Serial No. 259,570.



Claim.—1. In a loom, the combination with shifting or drop shuttle-boxes, of a plurality of filling-detector feelers, adapted to enter the shuttles, and having a longitudinal movement and also a movement in the arc of a circle.

2. In a loom, a plurality of filling-detector feelers, to detect substantial exhaustion of filling in the shuttles, said feelers moving in the arc of a circle in a vertical plane.

3. In a loom, the combination with a frame or support having a pivotal movement in a vertical plane, of a plurality of electromagnets carried on said frame or support.

4. In a loom, shifting or drop shuttle-boxes, a frame pivotally supported and carrying a plurality of filling-detector feelers, connections intermediate said frame and the shuttle-boxes, to communicate a pivotal movement to said frame at each movement of the shuttle-boxes, and cause the feelers to move in the arc of a circle so that only the feeler in line with the active shuttle will be in position to detect substantial exhaustion of filling.

5. In a loom, shifting shuttle-boxes, a frame pivotally supported and carrying a plurality of filling-detector feelers, connections intermediate said frame and the shuttle-boxes, to communicate a pivotal movement to said frame at each movement of the shuttle-boxes, and cause the feelers to move in the arc of a circle, a detector-rod, and connections intermediate said rod and the bunter of the filling-change mechanism, to cause said mechanism to operate when said detector-rod moves past the end of a feeler and said bunter.

6. In a loom, the combination with shifting shuttle-boxes, of a plurality of filling-detector feelers, one for each shuttle-box, and means for supporting said feelers, and for moving them with an angular or pivotal motion uniformly with the movement of the shuttle-boxes.

7. In a loom, the combination with shifting shuttle-boxes, and means to move them, of a plurality of electromagnets having movable cores or feelers, a pivotal or angular movable frame carrying said magnets, and means to move said frame to cause said feelers to have an angular or pivotal movement in a vertical plane.

8. In a loom, a plurality of movable filling-detector feelers, and means for supporting the same to cause the detecting ends of said feelers to move with an angular movement.

9. In a loom, a lay, a series of shuttle-boxes movable vertically on said lay and carrying bobbins, a plurality of filling-detector feelers moved in the arc of a circle on a pivoted frame, and said frame having a pivotal motion whereby a feeler will contact only with the bobbin in the active shuttle to detect substantial exhaustion of filling, when the lay is moved to its forward position.

808,967. **MEASURING-SPOON.** WILLIAM H. ARROWSMITH, Oakland, Cal. Filed May 10, 1905. Serial No. 259,771.

Claim.—1. A measuring device, consisting of a tubular case having an extension approximately equal to half the circumference of the tube and a front closed end to said extension, a plug slidable in the tube or extension to limit the containing portion thereof, and a latch by which the plug is locked in position.

2. In a measuring device, a tube having an extension cut down to approximately half the diameter of the tube, said extension having a hemispherical closed end, a plug slidable in the tube and having an extension cut down to correspond with the shape of the tube extension, a slot in the tube having transverse notches, and a spring-latch carried by the plug and adapted to engage with the notches of the tube.

808,968. **SECRET NAIL.** WILLIAM J. BODA, Dayton, Ohio, assignor of one-half to Lee M. Boda, Columbus, Ohio. Filed Mar. 20, 1905. Serial No. 251,716.

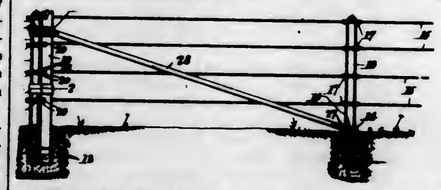
Claim.—1. A secret nail having a substantially elliptical shank, and having a head that is not substantially thicker than the shank.

2. A secret nail, consisting of a substantially elliptical shank, and a substantially elliptical head, said shank tapering toward the base of said head to expose the under surface of the latter.

3. A secret nail, consisting of a substantially elliptical shank, a substantially elliptical head, said shank tapering toward the base of said head, and said head having lower edges extending outward from said shank.

4. A secret nail, consisting of a substantially elliptical shank, a substantially elliptical head, said shank tapering toward the base of said head, and said head having lower edges extending outward from said shank, and having a convex upper surface, whereby said tapered shank is prevented from being injured by misdirected blows.

808,969. **FENCE-POST.** MICHAEL L. BOYCE, Carroll, Iowa. Filed Sept. 11, 1905. Serial No. 277,941.



Claim.—1. A fence-post comprising a plurality of units each embodying parallel upright bars rigidly connected at the top, winding-rollers journaled in the bars and serving to space the same, means connecting the units with their planes disposed at an angle each to the other, and a base common to and in which the units are rigidly secured.

2. A fence-post embodying parallel upright bars, a pin extending transversely through the bars and having one end thereof bent at an angle to the adjacent bar, a sleeve embracing the pin between and spacing the bars apart, a collar engaging the bent end of the pin, and a tubular brace seated upon the collar and extending obliquely to an adjacent post.

3. A fence-post embodying parallel upright bars, means rigidly connecting the bars, a winding-roller between and journaled in the bars and provided with an angular winding-shank, a socket formed partly in the bar and partly in the roller-trunnion, and a pin engaging the socket.

808,970. **ROPE-CLAMP.** JOSEPH J. CLARK, Athens, Ohio. Filed Sept. 18, 1905. Serial No. 279,014.

Claim.—1. A rope clamp or fastener comprising a slender body enlarged at one end and having the rope or cord coöperating therewith attached to the opposite end and folded and secured to the body by means of a half-hitch, and a link slidable upon the folded end portion of the rope or cord.

2. A rope clamp or fastener comprising a slender body having an eye at one end and a rounded weighted head at the opposite end, the rope or cord being adapted to be attached to said eye and to be secured to the body or stem by means of a half-hitch.

3. In combination, a rope or cord, a clamp comprising a stem or slender body having a weighted head of rounded form at one end and an eye at the opposite end, said rope or cord being attached to the eye and secured to the body by means of a half-hitch, and a link slidable upon the folded end portion of the rope or cord.

808,971. **BEVEL-GAGE FOR HANDSAWS.** HUGH CONDRON, Vancouver, Canada. Filed Sept. 26, 1905. Serial No. 280,134.

Claim.—1. As a bevel-gage, the combination with a handsaw, of a bevel-bar pivotally mounted on each side of the blade of the saw adjacent to the handle so as to be susceptible of movement in planes parallel to the face of the blade, an open-jawed link member the jaw ends of which are connected one to each free end of the bevel-bar, a seat member secured to the upper side of the handle, such seat member having upward projections to engage the width of the link, a screw secured in the seat member and projecting upward through the jaw of the link, and a milled head-nut having a tapered portion to enter between the jaws of the link and tighten them against the width-engaging projections of the seat member.

2. As a bevel-gage, the combination with a handsaw, of a bevel-bar pivotally mounted on each side of the blade adjacent the handle, a forked link-bar pivotally secured to the bevel-bar at its free end and straddling the saw-blade, and means for clamping the link-bar in position, substantially as shown and described.

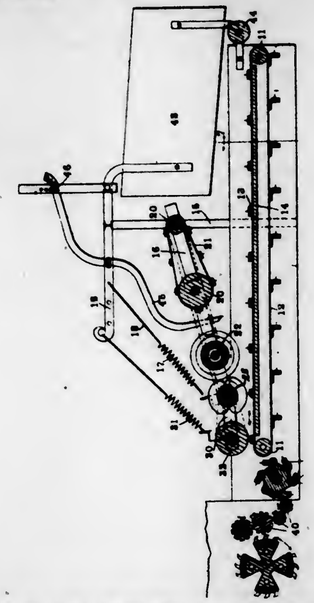
3. As a bevel-gage, the combination with a handsaw, of a bevel-bar pivotally mounted on each side of the blade adjacent the handle, a forked link-bar pivotally secured to each bevel-bar at its free end and straddling the saw-blade, means for clamping the link-bar in position, said last-named means comprising a seat member secured to the handle, said seat member having a screw portion projecting upwardly through the link member and a nut for securing the link member against the seat member, substantially as shown and described.

4. As a bevel-gage, the combination with a handsaw, of a bevel-bar, pivotally mounted on each side of the blade adjacent the handle, a forked link-bar pivotally secured to each bevel-bar at its free end and straddling the saw-blade, means for clamping the link-bar in position, said last-named means comprising a seat member secured to the handle, said seat member having a screw portion projecting upwardly through the link member and a nut for securing the link member against the seat member, and coöperating scale-marks on the link member and seat member to indicate the angular adjustment of the bevel-bar substantially as shown and described.

808,972. **SHREDDER-FEEDER.** GEORGE W. CRANE, Vesterburg, Ind. Filed June 23, 1904. Serial No. 213,670.

Claim.—1. In a feeder for shredders, the combination, with an endless carrier, of a pressure-roller journaled above said carrier and coöperating therewith, and a ratchet driving connection for said pressure-roller yieldable in the direction of feed, for the purpose set forth.

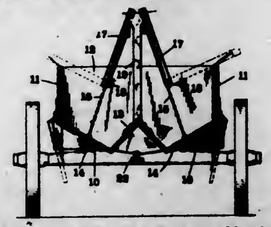
2. In a feeder for shredders, the combination, with an endless carrier provided with material-engaging means yieldable in the direction of movement of the carrier, a pressure-roller journaled above said carrier and coöperating therewith, and a ratchet driving connection for said roller yieldable in the direction of the movement of the carrier.



3. In a feeder for shredders, the combination, with an endless carrier, of a frame pivoted at one end above said carrier and extending downward and forward, an adjustable yielding support for the forward end of said frame, a pair of rollers journaled in said frame at its rear end, a raddle arranged over said rollers, a band-cutter roller journaled in said frame in front of said raddle, a spreader-roller journaled in said frame in front of the band-cutter roller, a supplemental frame pivoted to the forward free end of the first-mentioned frame, a yielding adjustable support for the free end of said supplemental frame, and a pressure-roller journaled in the forward end of said supplemental frame.

4. In a feeder for shredders, the combination, with an endless carrier, of a feeding-carrier arranged above said endless carrier and movable toward and from said endless carrier, band-cutting mechanism arranged above the carrier in advance of said feeding-carrier, and a retarding-rake independent of and arranged between said feeding-carrier and said band-cutting mechanism and projecting toward the endless carrier.

808,973. **DUMPING-WAGON.** GEORGE W. CRANE, Vesterburg, Ind. Filed June 5, 1905. Serial No. 263,260.



Claim.—1. In a dumping-wagon, the combination, with the bed-frame, of a swinging bottom therefor, a swinging arm, a connection between said swinging arm and the free end of the swinging bottom member, and means for limiting the swing of said swinging arm in one direction at a position slightly beyond the dead-center relative to the swinging bottom and the connection between said bottom and said lever.

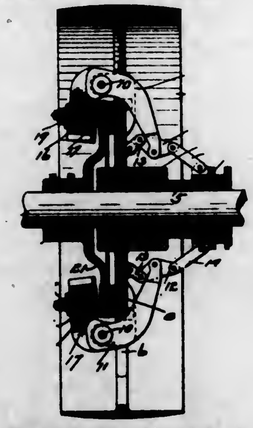
2. In a dumping-wagon, the combination, with the main bed, of a swinging bottom member therefor normally tending to open by reason of its weight, a substantially vertically swinging arm pivoted on said bed, a connection between said arm and the free end of said swinging bottom member, and means for limiting the movement of said arm in one direction to a point where the connection between said arm and the swinging bottom member is slightly past the dead-center.

3. In a dumping-wagon, the combination, with the main bed, of a swinging bottom member for a portion thereof mounted upon a substantially longitudinal axis, a second swinging bottom member for another portion of said head and mounted upon a transverse axis, an operating-lever mounted to swing in a substantially vertical plane, connections between said lever and each of said swinging bottoms, and means for limiting the swing of said lever at a point slightly beyond its dead-center.

808,974. PROTECTOR FOR PNEUMATIC TIRES. HENRI DAVID, Paris, France. Filed Jan. 20, 1904. Serial No. 189,856.

Claim.—An antislipping removable protector for pneumatic tires, comprising a series of independent narrow metallic strips secured upon and extending transversely of the tire, each of said strips being bent at two points to form a central tread portion and diagonally-arranged substantially straight sides having eyes at their extremities and fastening means passed through said eyes to hold the strips upon the tire.

808,975. FRICTION-CLUTCH. HERMANN G. DITTRENNER, Minneapolis, Minn., assignor to Diamond Iron Works, a Corporation of Minnesota. Filed Aug. 29, 1904. Serial No. 223,800.



Claim.—1. The combination, with a shaft, of a loose pulley thereon, a member fixed on said shaft and having a surface to be gripped, arms pivoted on said pulley and provided with gripping-blocks to engage said member, a sliding sleeve, plates pivotally connected intermediate to their ends on said arms, and links pivotally connecting the ends of said plates with said pulley and said sleeve, the links between said plates and sleeve being substantially at right angles to the latter when the clutch is locked.

2. In a friction-clutch, the combination, with a pulley, of the pivoted arms 11 thereon, a clutch member plates 12 having a pivotal connection with said arms, links 13 connecting one end of said plates with said pulley, a sliding sleeve, and links 14 connecting said sleeve with the other ends of said plates, the pivots of the links 13 and the pivotal point of the links 14 on the plates 12 being substantially in line when the parts are in their locked position, substantially as described.

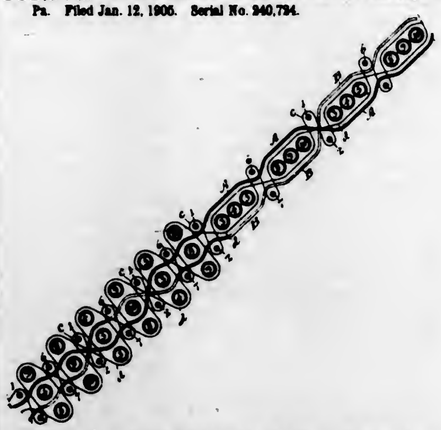
3. The combination, with a shaft, of a loose pulley thereon, a friction-disk fixed on said shaft and having a gripping-surface, arms pivoted on said pulley and provided with gripping-blocks, a sliding sleeve, links connecting said arms with said sleeve and with a fixed pivot on said pulley, the links connecting said arms with said sleeve exerting an outward drawing action on said arms, and the links connecting said arms with said fixed pivot exerting an outward thrust on said arms during their final movement to seat said blocks, substantially as described.

4. The combination, with a shaft, of a loose pulley thereon, a friction-disk fixed on said shaft and having a gripping-surface, arms pivoted on said pulley and provided with gripping-blocks, a sliding sleeve, plates pivoted at points intermediate to their ends on said arms, links connecting the ends of said plate with said sliding sleeve and with fixed pivots on said pulley, the links connecting said plates with said sleeve exerting an outward drawing action on said arms, and the links connecting said plates and said fixed pivots exerting an outward pushing or thrusting action on said arms during their final movement.

5. The combination, with a shaft and a loose pulley thereon, a friction-disk fixed on said shaft, arms pivoted on said pulley and having gripping-blocks to engage said disk, a sliding sleeve, links connecting said arms with said sleeve and with fixed pivots on said pulley, and the links connecting said arms and said fixed pivots serving as stops for said arms when in their inoperative position, substantially as described.

6. In a friction-clutch, the combination, with a revolving member, of a clutch member, arms pivoted on said revolving member and having gripping-blocks to engage said clutch member, a sliding sleeve, toggle mechanisms connecting said arms with said sleeve and with a fixed pivot, the toggle between said arms and said sleeve exerting an initial drawing action on said arms and the toggle between said arms and said fixed pivot supplementing the action of said sleeve-toggle by exerting a final outward thrust on said arms, and the connection of said arms with said toggle mechanisms being between their connections with said sleeve and said fixed pivot, substantially as described.

808,976. WOVEN FABRIC. THOMAS B. DORNAN, Philadelphia, Pa. Filed Jan. 12, 1905. Serial No. 240,734.



Claim.—1. A woven fabric having figuring weft-threads arranged in one plane in portions of the fabric and arranged in three planes in other portions of the fabric.

2. A woven fabric having figuring weft-threads arranged in one plane in portions of the fabric and arranged in three planes in other portions of the fabric and having warp-threads tying the weft-threads together from surface plane to surface plane at each side of each surface weft-threads at all portions where the figuring weft-threads are arranged in three planes.

3. A woven fabric having figuring warp-threads and figuring weft-threads, the figuring weft-threads being arranged in one plane in portions of the fabric and in three planes in other portions of the fabric, and the binder weft-threads being arranged in two planes.

4. A woven fabric having binder warp-threads and figuring warp-threads and figuring weft-threads, the figuring weft-threads being arranged in one plane in portions of the fabric and arranged in three planes in other portions of the fabric.

5. A woven fabric having binder warp-threads and figuring warp-threads and figuring weft-threads, the figuring weft-threads being arranged in one plane in portions of the fabric and in three planes in other portions of the fabric, and the binder warp-threads tying the weft-threads together from surface plane to surface plane at each side of each weft-thread at all portions where the figuring weft-threads are arranged in three planes.

6. A woven fabric having figuring weft-threads arranged in one plane in portions of the fabric and arranged in three planes in other portions of the fabric, and also having weft-threads arranged in two planes in other portions of the fabric.

7. A woven fabric having figuring weft-threads arranged in one plane in portions of the fabric and arranged in three planes in other portions of the fabric and also having weft-threads arranged in two planes in other portions of the fabric and having warp-threads tying the weft-threads together from surface plane to surface plane at each side of each surface weft-thread at portions where the weft-threads are arranged in two planes and three planes.

8. A woven fabric having figuring warp-threads and binder warp-threads and having figuring weft-threads arranged in one plane in portions of the fabric and arranged in three planes in other portions of the fabric and also having weft-threads arranged in two planes in other portions of the fabric.

9. A woven fabric having figuring warp-threads and binder warp-threads and having figuring weft-threads arranged in one plane in portions of the fabric and arranged in three planes in other portions of the fabric and also having weft-threads arranged in two planes in other portions of the fabric, the binder warp-threads tying the weft-threads together from surface plane to surface plane at each side of each surface weft-thread at all portions where the weft-threads are arranged in two planes and three planes.

10. A woven fabric having figuring weft-threads and binder weft-threads, the figuring weft-threads being arranged in one plane in portions of the fabric and in three planes in other portions of the fabric, and the binder weft-threads being arranged in two planes.

11. A woven fabric having figuring weft-threads and binder weft-threads, the figuring weft-threads being arranged in one plane in portions of the fabric and in three planes in other portions of the fabric, and the binder weft-threads being arranged in two planes, and having warp-threads tying the weft-threads together from surface plane to surface plane at each side of each surface weft-thread at all portions where the weft-threads are arranged in two planes and three planes.

12. A woven fabric having figuring warp-threads and figuring weft-threads and binder weft-threads, the figuring weft-threads being arranged in one plane in portions of the fabric and in three planes in other portions of the fabric, and the binder weft-threads being arranged in two planes.

13. A woven fabric having figuring warp-threads and binder warp-threads and figuring weft-threads and binder weft-threads, the figuring weft-threads being arranged in one plane in portions of the fabric and in three planes in other portions of the fabric, and the binder weft-threads being arranged in two planes, and the binder warp-threads tying the weft-threads together from surface plane to surface plane at each side of each surface weft-thread at all portions where the weft-threads are arranged in two planes and three planes.

14. A woven fabric having figuring warp-threads and binder warp-threads and figuring weft-threads and binder weft-threads, the figuring weft-threads being arranged in one plane in portions of the fabric and arranged in three planes in other portions of the fabric and the figuring warp-threads acting as stuffers between the surface figuring weft-threads and intermediate figuring weft-threads, and the figuring weft-threads acting as stuffers between the surface figuring warp-threads.

15. A woven fabric having figuring warp-threads and binder warp-threads and figuring weft-threads and binder weft-threads, the figuring weft-threads being arranged in one plane in portions of the fabric and in three planes in other portions of the fabric, and the binder weft-threads being arranged in two planes and the figuring warp-threads acting as stuffers between the surface figuring weft-threads and intermediate figuring weft-threads, and the figuring weft-threads acting as stuffers between the surface figuring warp-threads.

16. A woven fabric having figuring warp-threads and binder warp-threads and figuring weft-threads and binder weft-threads, the figuring weft-threads being arranged in one plane in portions of the fabric and arranged in three planes in other portions of the fabric, the binder warp-threads tying the weft-threads together from surface plane to surface plane at each side of each surface weft-thread at all portions where the weft-threads are arranged in two planes and three planes, and the figuring warp-threads acting as stuffers between the surface figuring weft-threads and intermediate figuring weft-threads, and the figuring weft-threads acting as stuffers between the surface figuring warp-threads.

17. A woven fabric having figuring warp-threads and binder warp-threads and figuring weft-threads and binder weft-threads, the figuring weft-threads being arranged in one plane in portions of the fabric and in three planes in other portions of the fabric, and the binder weft-threads being arranged in two planes, the binder warp threads tying the weft-threads together from surface plane to surface plane at each side of each surface weft-thread at all portions where the weft-threads are arranged in two planes and three planes and the figuring warp-threads acting as stuffers between the surface figuring weft-threads and intermediate figuring weft-threads, and the figuring weft-threads acting as stuffers between the surface figuring warp-threads.

18. A woven fabric having figuring weft-threads and binder weft-threads and figuring warp-threads and binder warp-threads, the binder warp-threads binding the figuring weft-threads with three figuring weft-threads in a loop of binder warp-threads.

19. A woven fabric having figuring weft-threads and binder weft-threads and figuring warp-threads and binder warp-threads, the binder warp-threads binding the figuring weft-threads with a plurality of figuring weft-threads in a loop of binder warp-threads, and each of such loops in the weft effects including a figuring weft-thread at each surface of the fabric and a figuring weft-thread between the two surface weft-threads.

20. A woven fabric having figuring weft-threads and binder weft-threads and figuring warp-threads and binder warp-threads, the binder warp-threads binding the figuring weft-threads with three figuring weft-threads in a loop of binder warp-threads and each of such loops in warp effects having the figuring weft-threads arranged in one plane.

21. A woven fabric having figuring weft-threads and binder weft-threads and figuring warp-threads and binder warp-threads, the binder warp-threads binding the figuring weft-threads with a plurality of figuring weft-threads in each loop of binder warp-threads, each of such loops in the weft effects including a figuring weft-thread at each surface of the fabric and a figuring weft-thread between the two surface weft-threads and each of such loops in warp effects having the figuring weft-threads arranged in one plane.

22. A woven fabric having figuring weft-threads and binder weft-threads and figuring warp-threads and binder warp-threads, the binder warp-threads binding the figuring weft-threads with a plurality of figuring weft-threads in a loop of binder warp-threads, each of such loops in the weft effects including a figuring weft-thread at each surface of the fabric and a figuring weft-thread between the two surface weft-threads, the figuring warp-threads acting as stuffers between the surface figuring weft-threads and intermediate figuring weft-threads, and the adjacent figuring weft-threads acting as stuffers between the surface figuring warp-threads.

23. A woven fabric having three figuring weft-threads and binder weft-threads and two figuring warp-threads and binder warp-threads, the binder warp-threads binding the figuring weft-threads with three figuring weft-threads in a loop of binder warp-threads, each of such loops in warp effects having the figuring weft-threads arranged in one plane, the figuring warp-threads acting as stuffers between the surface figuring weft-threads and intermediate figuring weft-threads and the figuring weft-threads acting as stuffers between the surface figuring warp-threads.

24. A woven fabric having figuring weft-threads and binder weft-threads and figuring warp-threads and binder warp-threads, the binder warp-threads binding the figuring weft-threads with a plurality of figuring weft-threads in each loop of binder warp-threads, each of such loops in the weft effects including a figuring weft-thread at each surface of the fabric and a figuring weft-thread between the two surface weft-threads and each of such loops in warp effects having the figuring weft-threads arranged in one plane, the figuring warp-threads acting as stuffers between the surface figuring weft-threads and intermediate figuring weft-threads and the figuring weft-threads acting as stuffers between the surface figuring warp-threads.

25. A woven fabric having figuring weft-threads and binder weft-threads and figuring warp-threads and binder warp-threads,

the binder warp-threads binding the binder weft-threads with a single binder weft-thread in a loop of binder warp-threads and binding the figuring weft-threads with a plurality of figuring weft-threads in a loop of binder warp-threads, each of such loops which contains figuring weft-threads including, in the weft effects, a figuring weft-thread at each surface of the fabric and a figuring weft-thread between the two surface weft-threads.

26. A woven fabric having figuring weft-threads and binder weft-threads and figuring warp-threads and binder warp-threads, the binder warp-threads binding the binder weft-threads with a single binder weft-thread in a loop of binder warp-threads and binding the figuring weft-threads with three figuring weft-threads in a loop of binder warp-threads, each of such loops which contains figuring weft-threads having, in the warp effects, the figuring weft-threads arranged in one plane.

27. A woven fabric having figuring weft-threads and binder weft-threads and figuring warp-threads and binder warp-threads, the binder warp-threads binding the binder weft-threads with a single binder weft-thread in a loop of binder warp-threads and binding the figuring weft-threads with a plurality of figuring weft-threads in a loop of binder warp-threads, each of such loops which contains figuring weft-threads including, in weft effects, a figuring weft-thread at each surface of the fabric and a figuring weft-thread between the two surface weft- threads, and having, in warp effects, the figuring weft-threads arranged in one plane.

28. A woven fabric having figuring weft-threads and binder weft-threads and figuring warp-threads and binder warp-threads, the weft-threads being arranged in sets of ten weft-threads each, each set comprising, in succession, two binder weft-threads, three figuring weft-threads, two binder weft-threads and three figuring weft-threads, the binder warp-threads being arranged in two sets and binding the figuring weft-threads with three figuring weft-threads in a loop of binder warp-threads.

29. A woven fabric having figuring weft-threads and binder weft-threads and binder warp-threads, the weft-threads being arranged in sets of ten weft-threads each, six figuring weft-threads and four binder weft-threads in each set, the binder warp-threads binding the figuring weft-threads with three figuring weft-threads in a loop of binder warp-threads.

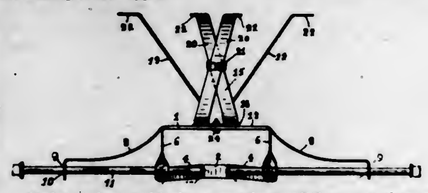
30. A woven fabric having figuring weft-threads and binder weft-threads and binder warp-threads, the weft-threads being arranged in sets of ten weft-threads each, six figuring weft-threads and four binder weft-threads in each set, the binder warp-threads binding the binder weft-threads with a single binder weft-thread in a loop of binder warp-threads and binding the figuring weft-threads with three figuring weft-threads in a loop of binder warp-threads.

31. A woven fabric having figuring weft-threads and binder weft-threads and figuring warp-threads and binder warp-threads, the weft-threads being arranged in sets of ten weft-threads each, each set comprising, in succession, two binder weft-threads, three figuring weft-threads, two binder weft-threads and three figuring weft-threads, the binder warp-threads being arranged in two sets and binding the binder weft-threads with a single binder weft-thread in a loop of binder warp-threads and binding the figuring weft-threads with three figuring weft-threads in a loop of binder warp-threads.

32. A woven fabric having figuring weft-threads and binder weft-threads and figuring warp-threads and binder warp-threads, the weft-threads being arranged in sets of ten weft-threads each, each set comprising, in succession, two binder weft-threads, three figuring weft-threads, two binder weft-threads and three figuring weft-threads, the figuring warp-threads being arranged in two sets and the binder warp-threads being arranged in two sets and binding the binder weft-threads with a single binder weft-thread in a loop of binder warp-threads and binding the figuring weft-threads with three figuring weft-threads in a loop of binder warp-threads, the figuring warp-threads acting as stuffers between the surface figuring weft-threads and the intermediate figuring weft-threads and the figuring weft-threads acting as stuffers between the surface figuring warp-threads, substantially as set forth.

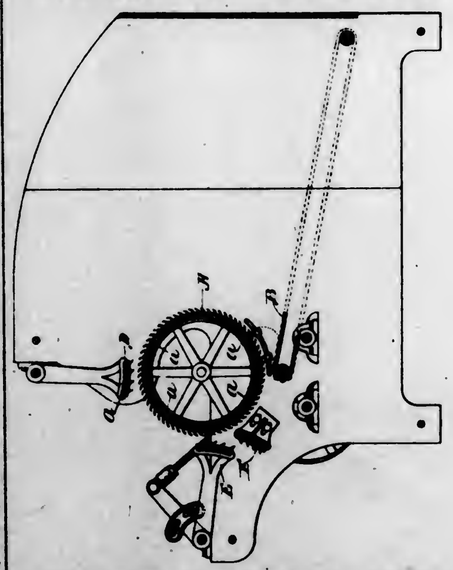
808,977. **FRONT BOLSTER AND BODY-SUPPORT FOR CHILDREN'S WAGONS.** GEO. P. EHARE, Toledo, Ohio. Filed May 8, 1905. Serial No. 259,593.

Claim.—1. In a bolster and body-support for a child's wagon, the combination with a body-support comprising a centrally-perforated bearing-plate and diverging arms secured to the bearing-plate, of a bolster comprising a single metal strap bent to form the parallel tongue-straps 3 at opposite ends of the central portion 2, the tongue-bounds 4, the axle-bearings 5, the bridge-supports 6, the parallel bridges 7, and the oppositely-extending truss-arms 8 having the angled end portions 9, the end portions 9 and the tongue-straps 3 having perforations alined with the bearings 5, a bearing-plate 13 conjoining the bridges 7, and means to pivot the bearing of the bolster to the bearing of the support.



2. In a bolster and body-support for a child's wagon, the combination with a front-axle truss-bolster having a central bearing, of a body-support mounted on the bearing, comprising a bearing-disk and a pair of complementary truss-supports secured to the disk, said truss-supports each being formed of a single piece of metal strap bent to form an arm at each end of a central portion, said central portion being secured in parallel relation to the top of the disk bearing, and the arms at one end of the base thus formed being reversely quarter-twisted and relatively diverging laterally from the base, and the arms at the opposite end being bent at obtuse angles to the base, and relatively converging and crossing, all of the arms having their free end portions perforated and angled outward in a common plane, and a pin-bolt centrally pivoting the bearing of the bolster to the bearing of the support.

808,978. **MACHINE FOR DISENTANGLING FIBERS.** DANIEL C. FISHER, Boston, Mass. Filed Aug. 13, 1904. Serial No. 220,626.



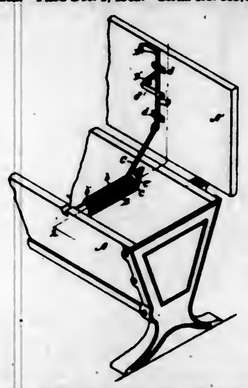
Claim.—1. A machine for disentangling fibers comprising a carrying-cylinder with teeth to carry the fleece past a vibrating segment; that vibrating segment with like teeth arranged in ranks but opposed to the teeth of the carrying-cylinder; and means to remove the fleece after it has been carried by the carrying-cylinder past the action of the vibrating segment, all combined to operate substantially as set forth.

2. A machine for disentangling fibers comprising a carrying-cylinder with teeth to carry the fleece past a primary vibrating segment; that primary vibrating segment with like teeth arranged in ranks but opposed to the teeth of the carrying-cylinder; and a secondary vibrating segment with like teeth but opposed to the teeth

of the primary segment, all combined to operate substantially as set forth.

3. In combination a toothed carrying-cylinder; a primary segment; a secondary segment; and means to adjust the stroke of each segment independently of the other, all substantially as described.

808,979. **SEEDBOX FOR GRAIN-DRILLS.** CHARLES L. FOWLE, Dowagiac, Mich., assignor to The Dowagiac Manufacturing Company, Dowagiac, Mich. Filed Dec. 1, 1902. Serial No. 133,426.



Claim.—1. In a device of the class described, the combination of a suitable box; a cover hinged thereto; a bracket B transversely supported in said box, having a longitudinal slot *b* with enlargements *b'* at its ends; a rock-shaft D carried by said cover; a spring *d'* on said rock-shaft adapted to retain the same in its initial position; a rod or link C pivotally secured to the end of said rock-shaft, having a laterally-projecting portion C' adapted to engage said slot *b* and slide therein when partially withdrawn; and a catch D'' on said rock-shaft adapted to engage said bracket B when the cover is closed, whereby said cover is adjustably retained in either its open or closed position, as specified.

2. In a device of the class described, the combination of a suitable box; a cover hinged thereto; a bracket B transversely supported in said box, having a longitudinal slot *b* with an enlargement; a rock-shaft D carried by said cover; a spring *d'* on said rock-shaft adapted to retain the same in its initial position; a rod or link C pivotally secured to the end of said rock-shaft, having a laterally-projecting portion C' adapted to engage said slot *b* and slide therein when partially withdrawn; and a catch D'' on said rock-shaft adapted to engage said bracket B when the cover is closed, whereby said cover is adjustably retained in either its open or closed position, as specified.

3. In a device of the class described, the combination of a suitable box; a cover hinged thereto; a bracket B transversely supported in said box, having a longitudinal slot *b* with enlargements *b'* at its ends; a rock-shaft D carried by said cover; a rod or link C pivotally secured to the end of said rock-shaft, having a laterally-projecting portion C' adapted to engage said slot *b* and slide therein when partially withdrawn; and a catch D'' on said rock-shaft adapted to engage said bracket B when the cover is closed, whereby said cover is adjustably retained in either its open or closed position, as specified.

4. In a device of the class described, the combination of a suitable box; a cover hinged thereto; a bracket B transversely supported in said box, having a longitudinal slot *b* with an enlargement; a rock-shaft D carried by said cover; a rod or link C pivotally secured to the end of said rock-shaft having a laterally-projecting portion C' adapted to engage said slot *b* and slide therein when partially withdrawn; and a catch D'' on said rock-shaft adapted to engage said bracket B when the cover is closed, whereby said cover is adjustably retained in either its open or closed position, as specified.

5. In a device of the class described, the combination of a suitable box; a cover hinged thereto; a bracket B transversely supported in said box having a longitudinal slot *b* with enlargements *b'* at its ends; a rock-shaft D carried by said cover; a spring *d'* on said rock-shaft adapted to retain the same in its initial position; a rod or link C pivotally secured to the end of said rock-shaft, having a laterally-projecting portion C' adapted to engage said slot *b* and slide therein when partially withdrawn, whereby said cover is adjustably retained in either its open or closed position, as specified.

6. In a device of the class described, the combination of a suitable box; a cover hinged thereto; a bracket B transversely supported in said box, having a longitudinal slot *b* with an enlargement; a rock-shaft D carried by said cover; a spring *d'* on said rock-shaft adapted to retain the same in its initial position; a rod or link C pivotally secured to the end of said rock-shaft, having a laterally-projecting portion C' adapted to engage said slot *b* and slide therein when partially withdrawn, whereby said cover is adjustably retained in position, as specified.

7. In a device of the class described, the combination of a suitable box; a cover hinged thereto; a bracket supported in said box having a longitudinal slot enlarged at its ends; a rock-shaft carried by said cover; a spring for holding the said rock-shaft under tension; a rod or link having a laterally-projecting portion adapted to engage said enlargements at the end of said slot, and to slide in said slot when partially withdrawn, for the purpose specified.

8. In a device of the class described, the combination of a suitable box; a cover hinged thereto; a bracket supported in said box having a longitudinal slot containing an enlargement; a rock-shaft carried by said cover; a spring for holding the said rock-shaft under tension; a rod or link having a laterally-projecting portion adapted to engage said enlargement and to slide in said slot when partially withdrawn, for the purpose specified.

9. In a device of the class described, the combination of a suitable box; a cover hinged thereto; a bracket supported in said box having a longitudinal slot enlarged at its ends; a rock-shaft carried by said cover; a rod or link having a laterally-projecting portion adapted to engage said enlargements at the ends of said slot and to slide in said slot when partially withdrawn, for the purpose specified.

10. In a device of the class described, the combination of a suitable box; a cover hinged thereto; a bracket supported in said box having a longitudinal slot containing an enlargement; a rock-shaft carried by said cover; a rod or link having a laterally-projecting portion adapted to engage said enlargement and to slide in said slot when partially withdrawn, for the purpose specified.

11. The combination of a box; a cover hinged thereon; a latch within said box arranged to automatically lock said cover in its open and in its closed positions; and a lever adapted to release the said latch, the said lever projecting outside of said box, for the purpose specified.

12. The combination of a box; a cover hinged thereon; a latch within said box, arranged to support and automatically lock said cover in its open position; and a lever for releasing said latch, the said lever projecting outside of the said box, for the purpose specified.

808,980. **BASE-BALL CATCHER'S MITT.** JOHN GAMBLE, Philadelphia, Pa., assignor to George A. Reach, Philadelphia, Pa. Filed Apr. 17, 1905. Serial No. 256,004.

Claim.—1. A base-ball mitt comprising a palm portion and back portion, each having a thumb extension, an integral flange extending rearwardly from the palm portion, lacing detachably connecting the flange with the back portion, a removable pad between the front and back portions, and a pocket formed in the front portion in close proximity to the thumb extension, substantially as described.

2. A base-ball mitt comprising a palm portion and a back portion, each having a thumb extension, an integral rearwardly-extending flange integral with said palm portion and narrowing in width between the thumb extension and body, lacing detachably connecting the rear edge of the flange with the back portion, and a pocket formed at the point where the said flange is of reduced width, substantially as described.

808,981. **TOOL-HOLDER.** CLARENCE L. GOODRICH, Hartford, Conn., assignor to Pratt & Whitney Company, Hartford, Conn., a Corporation of New Jersey. Filed Dec. 27, 1904. Serial No. 238,549.

Claim.—1. A holder for a screw-cutting tool comprising a pair of members, and means for connecting said members so that one will gradually yield in a spiral path while the tool is in operation.

2. A holder for a screw-cutting tool comprising a fixed member and a movable tool-carrying member, and guides on one member entering grooves in the other member, and constructed to permit arcuate movement of the movable member while the tool is cutting a thread.

3. The combination, with a fixed member, of guides having inclines, and rigid with said member; and a longitudinally-movable tool-carrying member having grooves for the reception of said guides, one wall of each groove having an incline bearing against its guide.

4. The combination, with a fixed member having inclined guides, of a tool-carrying member having grooves wider than said guides, one wall of each groove having a bearing-point on the inclined surface of its guide; and means for connecting the members for longitudinal sliding movement.

5. The combination, with a fixed head having a tubular shank, of a tool-carrying head having a shouldered stem inserted in said shank; a stop for limiting the inward movement of the tool-carrying head; a collar loose on the stem, and adapted to bear against a stop in the bore of the shank; a spring bearing against said collar; and a device on the shank for retaining the spring.

6. The combination, with a pair of devices, one of which is reciprocable with relation to the other, of inclined clutching guides carried by one device, and bearing-surfaces on the other device, and in engagement with said guides, whereby progressive arcuate movement of one device with relation to the other is permitted, to avoid binding of the parts when one device moves toward and from the other.

808,982. **BOILER-FLUE CLEANER.** ANDREAS GRÖNVALD, New Haven, Conn., assignor of one-half to Charles A. Bradley, Woodbridge, Conn. Filed May 15, 1905. Serial No. 260,453.

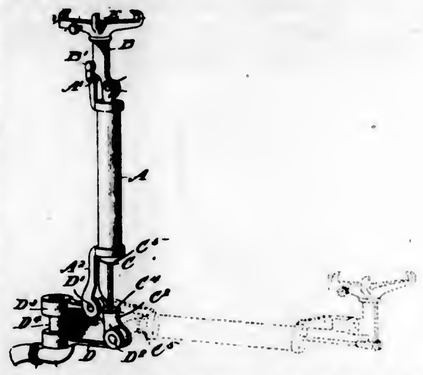
Claim.—1. In a boiler-flue cleaner, the combination with a header, vertically-arranged cleaning-pipes connected therewith and opening therefrom, a valve-tube within said header and provided with two or more series of openings each series adapted to open communication between the header and a portion of the cleaner-pipes, and close connection between the remaining portion of the cleaning-pipes and the header, substantially as described.

2. In a boiler-flue cleaner comprising a horizontally-arranged header, vertically-arranged perforated cleaning-pipes connected thereto and communicating therewith, a valve-tube within said header and formed with two or more series of openings each series adapted to open communication between said header and a portion of said cleaning-pipes, the several sets of openings arranged out of line with each other whereby when communication is opened between a portion of the pipes and the header the communication between the remaining pipes and the header will be closed, and a handle connected with said valve-tube and extending outward through said header, substantially as described.

808,983. **TELEPHONE-HOLDER.** LOUIS B. HALLOWELL, New York, N. Y., assignor of one-half to Thomas L. Ricart, Philadelphia, Pa. Filed Mar. 28, 1905. Serial No. 252,857.

Claim.—1. In a device of the class described, a tubular supporting-arm, a holder pivotally mounted to one end thereof, a base upon which said arm is pivoted, an adjusting-rod extending through said arm from said holder to said base, and a spring carried by the arm and connected to said rod to be placed under tension in the movement of said arm in one direction.

2. In a device of the class described, a tubular supporting-arm, a holder pivotally mounted at one end thereof, a base upon which said arm is pivoted, an adjusting-rod extending through said arm from said holder to said base, and a tension-spring surrounding said rod and bearing on said arm.



3. In a device of the class described, a tubular supporting-arm, a holder pivotally mounted to one end thereof, a base, an adjusting-rod extending through said arm from said holder to said base, a tension-spring surrounding said rod and bearing on said arm, and an attachment for pivotally supporting said tubular arm and base.

4. In a device of the class described, a tubular arm having pivoting-lugs at each end disposed at one side of the axial center of the arm, a holder pivoted to one of said lugs and having a rod connection in alinement with the end of said arm, a base to which the opposite lug is pivoted provided with a rod connection in alinement with the end of said arm, and a rod secured to the connections upon said holder and base and passing through said arm.

5. In a device of the class described, a tubular arm having pivoting-lugs at each end disposed at one side of the axial center of the arm, a holder pivoted in one of said lugs, a base to which the opposite lug is pivoted, a rod connecting said holder and base and passing through said arm, an apertured partition within said tubular arm, a spring surrounding said rod and bearing at one end against said partition, and an abutment carried upon said rod for the opposite end of said spring.

6. In a device of the class described, a base, a tubular arm pivoted thereto, a holder pivoted at the free end of said arm, a connection pivotally connected to said holder and base, and a spring bearing on said connection and arm and adapted to be placed under an increasing tension in the downward movement of the arm from a vertical to a horizontal plane.

7. In a device of the class described, a tubular supporting-arm, a holder pivotally mounted at one end thereof, a base upon which said arm is pivoted, an adjusting-rod extending through said arm from said holder to said base, a tension-spring bearing upon said rod and holder, a plate carried by the lower end of said rod, and a curved contact-face carried by the lower end of said arm.

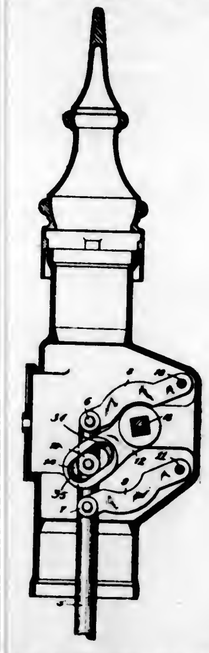
8. In a device of the class described, a tubular supporting-arm, a holder pivotally mounted at one end thereof, a base upon which said arm is pivoted, a straight adjusting-rod extending through said arm, curved connectors secured to the opposite ends of said rod and pivoted to the holder and base, and a tension-spring bearing upon said rod and arm.

9. In a device of the class described, a tubular supporting-arm, a holder pivotally connected to the upper portion thereof, a depending coupling from said holder disposed in alinement with the axial center of the arm, a rod extending from said coupling through said arm, and a base provided with pivotal connections for said arm and rod disposed in parallel vertical planes and different horizontal planes.

10. In a device of the class described, a tubular supporting-arm, a holder pivotally connected to the upper portion thereof, a rod pivotally connected to said holder, a spring surrounding said rod and bearing upon said arm to be placed under tension in the travel of said arm, a base provided with pivotal connections for said arm and rod disposed in parallel vertical planes and different horizontal planes, an attachment for said base provided with a pintle, ears upon the base to receive said pintle, and a securing-plate for said attachment.

11. In a device of the class described, a tubular supporting-arm, a holder connected thereto, a rod pivotally connected to said holder, a base pivotally connected to said arm and rod, an attaching device for said base comprising a plate having a threaded socket secured thereto, a pintle provided with an angularly-disposed threaded shank to enter said socket, and a pivoting-lug carried by the base to seat upon said pintle.

808,984. **SIGNALING APPARATUS.** JAMES T. HANRAY, New York, N. Y. Filed June 30, 1903. Serial No. 164,713.



Claim.—1. In a signaling apparatus a crank-arm and means for varying the distances between its centers during the operation thereof whereby the leverage on said arm is substantially constant.

2. In a signaling apparatus a crank-arm and means for actuating the same, the parts being so arranged that the leverage on the crank-arm is substantially constant.

3. In a signaling apparatus a rod, a crank-arm and means actuated by said rod adapted to travel on said arm so as to vary the distances between the centers of said arm during the operation thereof whereby the leverage on said arm is substantially constant.

4. In a signaling apparatus, a rod, means for guiding said rod, a shaft, an arm mounted on said shaft and means actuated by said rod adapted to travel on said arm so as to vary the distances between the centers of said arm during the operation thereof whereby the leverage on said arm is substantially constant.

5. In a signaling apparatus a rod, a crank-arm and means for guiding said rod so as to exert a substantially constant leverage on said arm.

6. In a signaling apparatus a rod, links adapted to guide said rod, a shaft, a slotted arm mounted on said shaft and a roller carried by said rod and adapted to travel in said slot.

7. In a signaling apparatus a rod, links adapted to guide said rod and swinging on a predetermined radius, a shaft, a slotted arm mounted on said shaft and adapted to swing on a radius different from that of the guiding-links and a roller carried by said rod adapted to travel in the slot.

8. In a signaling apparatus a shaft, a slotted crank-arm mounted on said shaft, said slot being provided with knife-edges at its end.

9. In a signaling apparatus a rod, means for guiding said rod, a shaft, a slotted arm mounted on said shaft, knife-edges at the ends of said slot and a roller carried by said rod and adapted to travel in said slot.

808,985. **METAL PILING.** JAMES J. HAROLD, Jersey City, N. J., assignor, by mesne assignments, to Emma Harold, Jersey City, N. J. Filed Dec. 28, 1904. Serial No. 238,573.

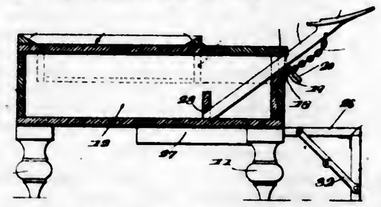
Claim.—1. In piling, flanged beam members and interlocking bolts, said interlocking bolts adapted to receive flanges of said beam members and lock said beam members together.

2. In piling, channel-beams and interlocking bolts, said bolts adapted to receive the flanges of said channel-beams and lock said beams together.

3. In piling, the flanges of channel-beams turned away from each other, and the backs of said channel-beams locked together by interlocking bolts engaging some of said flanges.

4. In piling, flanged beam members and interlocking bolts, said interlocking bolts having looped hooks, and adapted to receive and lock the flanges of said beam members.

808,986. **SHOE-POLISHING STAND.** PETER H. HIXON, Chicago, Ill. Filed Jan. 6, 1905. Serial No. 239,934.



Claim.—In a shoe-polishing stand, a hollow base having spaced seats opening upwardly in its front wall and with a stationary top portion at the rear, a front portion hinged to said stationary top portion and bearing over said seats and closing the open ends of the same, a stop member within said base and bearing on the bottom thereof and provided with recesses in the lower edge in alinement with said seats, and bars extending through said seats and engaging said recesses at their inner ends and with foot-rests at their outer ends.

808,987. **PROCESS OF PRINTING FABRICS.** PAUL JEANNAIRE, and HENRY SCHMID, Mülhausen, Germany, assignors to Arnold Print Works, North Adams, Mass., a Corporation of Massachusetts. Filed Apr. 6, 1903. Serial No. 151,312. (Specimens.)

Claim.—1. The method of producing designs upon vegetable textile fabrics, which consists primarily, in successively printing thereon, in either order of sequence, two separate constituents whose combination is essential to the formation of a fixed color, in such manner as to superimpose the one upon the other wherever the design is to be produced, that is to say: printing with one of these constituents suitably thickened, a delimiting figure having its area and contour, respectively, corresponding to the field and outline of the ultimate design; and printing with the other remaining constituent suitably thickened, a pattern of decorative detail consisting of predetermined variegations and having, in the aggregate, such extent and shape as, when printed, to cover the spaces occupied by the field of the delimiting figure; next subjecting the fabric so printed to treatment adapted for effecting the combination of the said constituents in the formation of such fixed color, wherever they may have been coincidentally deposited; and finally clearing from the fabric those removable portions of the said constituents which have remained isolated from each other.

2. The method of producing designs upon vegetable textile fabrics, by successively printing thereon, in either order of sequence, but so as to superpose one imprint upon the other wherever the design is to be produced, on the one hand, with a suitably-thickened fixative for a coloring-matter, a delimiting figure having its area and contour, respectively, corresponding to the field and outline of the ultimate design, and, on the other hand, with a suitably-thickened coloring-matter appropriate for such fixative, a decorative pattern of predetermined variegations having, in the aggregate, such extent and shape as, when printed, to cover the spaces occupied by the field of the delimiting figure; then subjecting the fabric so printed to treatment adapted for intimately combining the said fixative and

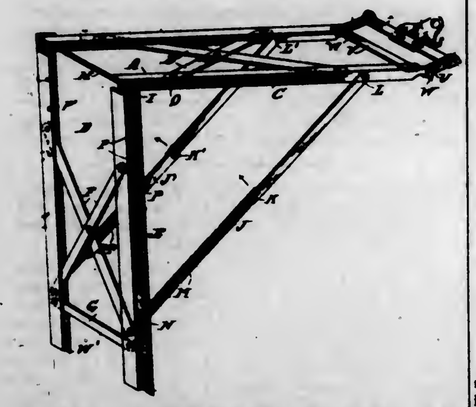
coloring-matter wherever they may have been coincidently deposited; and finally, clearing from the fabric those portions of the coloring-matter which have remained isolated from the fixative.

808,988. SEPARABLE BUTTON OR STUD. WILLIAM H. KNOWS, Providence, R. I. Filed Mar. 29, 1905. Serial No. 252,745.

Claim.—1. A separable button comprising two button-heads one of which is hollow, and a curved hollow one-piece shank attached to one head and adapted to bear against the other head, said shank being formed with a notch near one end, a spring composed of two curved integral arms, one of said arms being attached to the inner wall of the outer plate of the hollow head, the other of said arms carrying a lug adapted to seat in the notch of the shank, said last-named arm extending into the hollow head, and a link arranged in the hollow head and engaging said last-named arm and extending through an opening in the perimeter of the hollow head.

2. A separable button comprising two heads, one of which is hollow, and a hollow shank carried by one head and bearing against the other head, said shank being formed with a notch near one end, a spring composed of two integral arms, the ends of both said arms being located in said hollow head and the end of one of said arms being attached within the hollow head while the other end is free, said free end carrying a lug adapted to seat in the notch in the shank, and a link arranged in the hollow head, and engaging said free end, and extending through an opening in the perimeter of the hollow head.

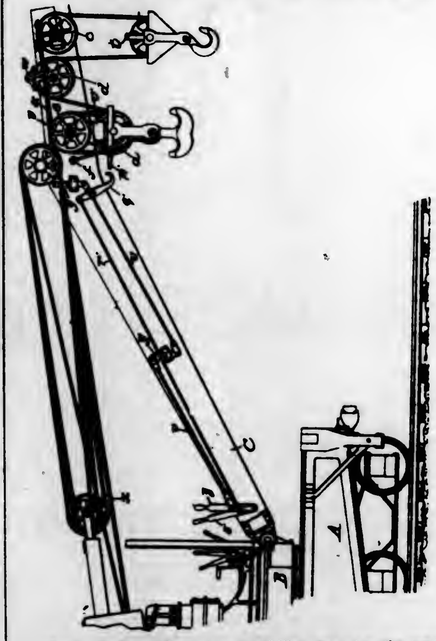
808,989. PORTABLE STAGING. THOMAS H. KINGSTON, Somerville, Mass. Filed Apr. 27, 1905. Serial No. 257,756.



Claim.—1. A portable, folding frame for supporting a temporary roof-staging, comprising the combination of the following parts constructed, arranged, and operated as described, namely: a pair of horizontal platform-arms united by cross-bars and braces firmly riveted thereto: a pair of upright supports united in like manner by cross-bars and braces riveted thereto: a rod extended through and connecting the ends of said platform-arms and upright supports, thus hinging the two sections together: a pair of notched and jointed folding braces pivoted to the platform-arms, and at their opposite ends adjustably interlocked by means of their notches, with suitable studs projecting from the outside faces of the upright supports: and a fastening-plate riveted to a cross-bar having upturned ears connected by pivoted links to the front ends of the platform-arms, said plate being provided with spurs on its under side, and an opening through its body, and by the flexibility of its connections made capable of lying flat against roofs of varying pitch; all as and for the purposes specified.

2. The combination of section A, composed of arms C, C', formed of angle-steel, and united by cross-braces D, and bar V, riveted to the arms: section B, composed of supports E, E', of like construction as said arms, and united by cross-braces F, and bar G, riveted thereto, the arms of section A having single holes O, in their sides, and penetrating points W, on their front ends, and the supports of section B having suitably-arranged holes P, P', in their sides, and penetrating points W' on their lower ends, and projecting studs N, N' on their opposite outer faces: adjustable braces J, J', pivoted to arms at L, L', and jointed together at K, K', and having notches M, M', arranged to interlock with studs N, N'; rod H by which sections A and B are detachably pivoted together, and adjustably united so as to conform to various pitches of roof: and a fastening-plate R, formed with spurs on its under side, and a hole through its body, and being riveted to a movable bar T, which is pivoted at T' and T² to links U, U', pivoted to the front ends of arms C, C'; all constructed, combined and arranged to operate together substantially in the manner and for the purposes specified.

808,990. HOISTING APPARATUS. SAMUEL L. G. KNOX, Milwaukee, and WALTER FERRIS, South Milwaukee, Wis., assignors to The Bucyrus Company, South Milwaukee, Wis., a Corporation of Wisconsin. Filed Oct. 22, 1904. Renewed Nov. 20, 1905. Serial No. 288,089.



Claim.—1. In wrecking-cranes and like apparatus, the combination of two hoist-blocks supported from the jib, an intermediate idler-sheave, an operating-cable engaging the hoist-blocks and intermediate sheave, means for locking the cable against motion between the hoist-blocks, and means for locking one of said blocks to the jib, whereby either of said blocks may be operated by the same cable.

2. In wrecking-cranes and like apparatus, the combination of two hoist-blocks supported from the jib, an intermediate idler-sheave on the jib, an operating-cable anchored at one end to the jib and connected to a winding-drum at the other end, said cable engaging the hoist-blocks and the idler, a clamp for locking the cable to the idler, a clutch for locking one of said blocks to the jib, and means for operating said clamp and said clutch, whereby either of said blocks may be operated by the same cable.

3. In wrecking-cranes and like apparatus, the combination of two hoist-blocks supported from the jib, an intermediate idler-sheave on the jib, an operating-cable anchored at one end to the jib and connected to a winding-drum at the other end, said cable engaging the hoist-blocks and the idler, a clamp for locking the cable to the idler, a clutch for locking one of said blocks to the jib, a hand-lever, and reach-rod connections from the hand-lever to the clamp and clutch, whereby either of said blocks may be operated by the same cable.

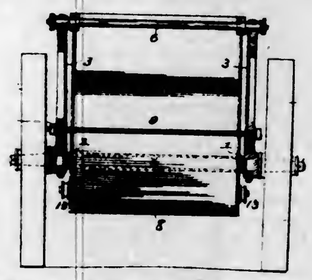
4. In wrecking-cranes and like apparatus, the combination of two hoist-blocks supported from the jib, idler-sheaves on the jib adjacent to each of said blocks, an idler-sheave on the jib intermediate the first-mentioned idler-sheaves, an operating-cable anchored at one end to the jib and engaging a winding-drum at the other end, a clamp on the jib for locking the rope to the intermediate idler-sheaves, a pendular clutch on the jib for locking one of the blocks to the jib, a hand-lever, and reach-rod connections from the hand-lever to the clamp and the clutch, whereby either of said blocks may be operated by the same cable.

5. In wrecking-cranes and like apparatus, the combination of two hoist-blocks, an operating-cable therefor, and means for holding the idle hoist-block clear of the load lifted by the other hoist-block.

6. In wrecking-cranes and like apparatus, the combination of two hoist-blocks, an operating-cable therefor, and a hook on the jib adapted to engage the idle hoist-block and hold the same clear of the load lifted by the other hoist-block.

7. In wrecking-cranes and like apparatus, the combination of two hoist-blocks, an operating-cable therefor, a hook on the jib adapted to engage the idle hoist-block and hold the same clear of the load lifted by the other hoist-block, and a hand-lever and reach-rod on the jib for operating said hook.

808,991. DUMPING-VEHICLE. SAMUEL C. LANCASTER, Jackson, Tenn. Filed Jan. 13, 1905. Serial No. 241,673.



Claim.—1. A dumping-wagon comprising a frame and two body-sections hinged together at their upper ends and supported within said frame, and a single wheel at each side of said frame.

2. A dumping-wagon comprising a sectional hopper-shaped body having its members hinged together at the top, a draft-frame, means for mounting said body-sections in said draft-frame and a single wheel at each side of said draft-frame.

3. A dumping-wagon comprising a draft-frame, a wheel at each side thereof, upright bars located centrally on said frame, and two body-sections hinged together at their upper ends and supported coincident with said hinged connection by said upright bars.

4. A dumping-wagon comprising a draft-frame, axle-stubs projecting outwardly at each side of said frame, wheels on said axle-stubs, bars attached to the draft-frame adjacent to said axle-stubs and projecting upwardly, and a hopper-shaped body comprising two hinged members, disposed between said upright bars and supported from the upper ends thereof.

5. A dumping-wagon comprising a draft-frame, a single wheel at each side of the center thereof, a hopper-shaped body comprising two sections hinged together at their upper ends, means supporting said body at their hinged upper ends, upon said draft-frame, means for normally locking said body-sections together and means for drawing the sections together.

6. The combination of a crank-axle, wheels supporting the same, and a body comprising two sections, each hinged upon and supported by said crank-axle between said wheels.

7. The combination of a crank-axle, wheels supporting the same, and a hopper-shaped body suspended from the axle, and comprising two half-sections hinged together upon the axle.

8. The combination with a crank-axle, wheels supporting the same, and a body suspended from the axle, of means for adjusting the axle to change the angle of inclination of the wheels.

9. The combination of a crank-axle comprising separable sections, wheels supporting said axle, a body suspended from the axle, and a rod passed through upright sections of the crank-axle, and a nut screwed on said rod and adapted to adjust the axle-sections to change the angle of inclination of the wheels.

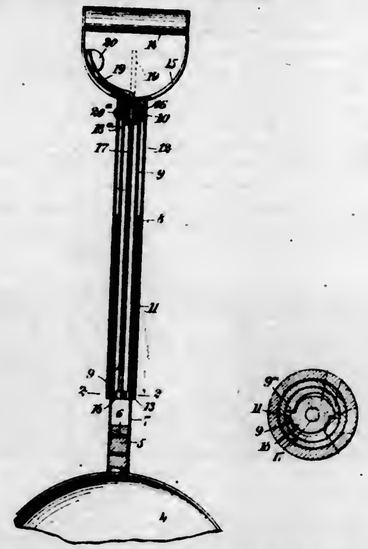
10. In a dumping-vehicle, the combination with a horizontal open frame, of a crank-axle having its stubs projected out beyond the frame, wheels on said stubs, and a hopper-bottom suspended from the axle in the frame, and comprising two half-sections hinged together on the axle, means for drawing the sections together or permit them to separate, and means for locking them together.

11. A dumping-wagon comprising a frame, wheels supporting said frame, a body supported by the frame, and means for adjusting the wheels to adapt them to the pitch of the road.

12. The combination with a body, a frame carrying the same, and wheels supporting said frame and body, of means for inclining said wheels in opposite directions to adapt their treads to the pitch of the road to be traveled.

13. A dumping-wagon, comprising a draft-frame, uprights thereon, a body supported in said frame, axles projecting laterally from the lower ends of said uprights, wheels on said axles, and means for inclining the uprights to incline the treads of the wheels to adapt them to the pitch of the road to be traveled

808,992. EXTENSIBLE HANDLE. DANIEL LAWSON, New York N. Y. Filed Apr. 6, 1905. Serial No. 254,948.



Claim.—1. The combination of a fork, a hand-grip mounted therein, an inner tube provided with an annular portion encircling a portion of said fork, an outer tube encircling said inner tube and spaced therefrom by said annular portion, a telescopic member disposed intermediate of said inner and outer tubes and free to slide relatively thereto, and means for locking said telescopic member rigidly in relation to said inner and outer tubes.

2. The combination of a fork, telescopic members connected therewith, one of said telescopic members being provided with cam-lobes, a rocking stem mounted within said fork and provided with cam-lobes mating said first-mentioned cam-lobes, and means controllable by hand for causing said stem to rock.

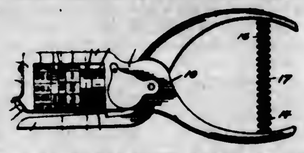
3. The combination of telescopic tubular members adapted to slide relatively to each other, one of said members being provided with cam-lobes, a rocking stem disposed within said tubular members and provided with cam-lobes mating the cam-lobes first mentioned, means controllable at will for turning said rocking stem so as to force all of the cam-lobes into locking engagement, and a member connected with one of said tubular members and provided with a hand-grip.

4. The combination of an inner tube provided with a bowl or the like, an outer tube encircling said inner tube and slidable relatively thereto, said outer tube being provided with a handle portion, a revoluble member mounted centrally within said inner tube and adapted to be turned at will by hand and cam mechanism operated by said revoluble member for securing said inner and outer tube rigidly together.

5. The combination of an inner tube provided with a bowl or the

like, an outer tube partially encircling said inner tube and slidable relatively thereto, and means for temporarily securing said outer tube and said inner tube rigidly together.

808,993. ADJUSTABLE TIME-LIMIT STAMP. WILLIS L. LEE, St. Louis, Mo. Filed Jan. 26, 1905. Serial No. 243,607.



Claim.—1. In an adjustable time-limit stamp, a pair of jaws pivotally held together, handles integral with said jaws, a cylinder detachably positioned in the upper jaw, a series of printing-wheels adjustably mounted on said cylinder, a cushion positioned in the top surface of the lower jaw, and a printing-ribbon positioned between the printing-wheels and the cushion, substantially as specified.

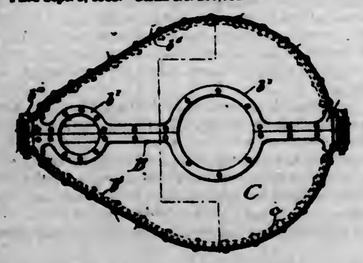
2. In an adjustable time-limit stamp, a pair of handles pivoted together, jaws formed integral with said handles, a cylinder detachably secured to one of the jaws, a series of printing-wheels adjustably carried by said cylinder, there being a circular recess formed in said jaw; a printing-ribbon wound up within said recess, the free end of which ribbon passes beneath the printing-wheels and having its outer end secured to the outer end of the jaw, and a cushion positioned in the top face of the opposite jaw, substantially as specified.

808,994. COMBINED PUNCH AND TIME-STAMP. WILLIS L. LEE, St. Louis, Mo. Filed May 1, 1905. Serial No. 258,418.

Claim.—1. In a combined punch and time-stamp, a pair of jaws pivotally held together, handles for said jaws, a tape-housing integral with each handle, a series of printing-wheels carried by one of the jaws, an impression-pad carried by the opposite jaw, and an inking-tape extending from one housing around the printing-wheels and into the opposite housing, substantially as specified.

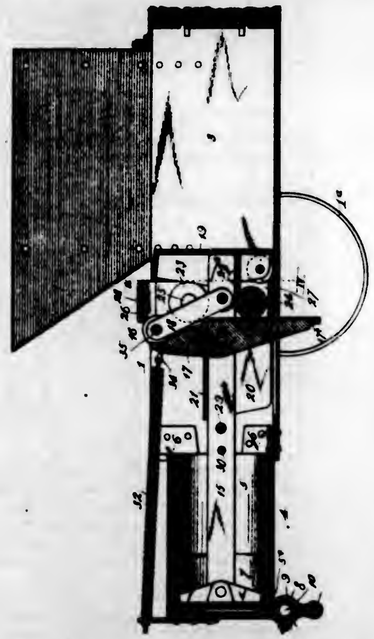
2. In a combined punch and time-stamp, a pair of jaws pivotally held together, handles formed integral with said jaws, tape-housing formed integral with said handles, tape-spindles in each of said housings, a series of printing-wheels carried by one of the jaws, an impression-pad carried by the opposite jaw, and a tape wound upon one of the spindles and passing around all of the printing-wheels, and being wound upon the opposite spindle, substantially as specified.

808,995. GEAR-CASING. FREDERICK H. LINCOLN, Philadelphia, Pa. Filed Sept. 9, 1905. Serial No. 277,761.



Claim.—A gear-casing comprising upper and lower integral side frames having semicircular registering portions, upper and lower exposed curved spring-metal bands connected at their ends to the ends of said side frames and forming the top and bottom of the casing, means for connecting the side frames so that the semicircular portions form circular apertures for the shafts, flexible side panels, each having its outer edge secured to and within the edge of the corresponding resilient band and its inner edge secured upon its side frame, and rivets securing the panels to the spring-metal bands.

808,996. BALING-PRESS. WINFIELD S. LIVINGOOD, Kansas City, Mo., assignor to Smith & Sons Mfg. Co., Kansas City, Mo. Filed Dec. 27, 1904. Serial No. 238,275.



Claim.—1. In a baling-press, a baling-case, a head-block reciprocably arranged therein, a toggle connected to the head-block and adapted to move back and forth therewith, means for operating said toggle, and means interposed in the path of one end of the toggle to prevent said end from moving forwardly until the toggle has become extended or partly extended.

2. In a baling-press, a baling-case, a head-block reciprocably arranged therein, a toggle connected to the head-block and adapted to move back and forth therewith, means for operating said toggle, means interposed in the path of one end of the toggle to prevent said end from moving forwardly until the toggle has become extended or partly extended, and means for folding said toggle when it moves backwardly.

3. In a baling-press, a baling-case, a head-block reciprocably arranged therein, a cylinder secured to said baling-case, a piston-head reciprocably arranged in said cylinder, a toggle connected to the head-block and suitably connected to the piston-head and adapted to move back and forth therewith, and means interposed in the path of one end of the toggle to prevent said end from moving forward until the toggle has become extended or partly extended.

4. In a baling-press, a baling-case, a head-block reciprocably arranged therein, a toggle connected to the head-block and adapted to move back and forth therewith, means for operating said toggle, and means for preventing the toggle from folding when moving forwardly.

5. In a baling-press, a baling-case, a head-block reciprocably arranged therein, a cylinder secured to said baling-case, a piston-head reciprocably arranged in said cylinder, a toggle connected to the head-block and suitably connected to the piston-head and adapted to move back and forth therewith, a roller interposed in the path of one end of the toggle to prevent said end from moving forward until the toggle has become extended or partly extended, and means for preventing said toggle from folding when moving forwardly.

6. In a baling-press, a baling-case, a head-block reciprocably arranged therein, a cylinder secured to said baling-case, a piston-head reciprocably arranged in said cylinder, a piston-bar suitably secured to the head-block and said piston-head, a yoke secured in the baling-case, and a stop-pin extending transversely through the piston-bar adapted to contact with said yoke.

7. In a baling-press, a baling-case, a head-block arranged to travel therein, longitudinal flanges secured to said head-block, and guides in the baling-case beneath which said flanges travel.

8. In a baling-press, a baling-case, a head-block reciprocably arranged therein, a cylinder secured to said baling-case, a piston-head reciprocably arranged in said cylinder, piston-bars suitably secured to the head-block and said piston-head, a yoke secured in the baling-case, and guide-rollers journaled in the yoke between which the piston-bars operate.

9. In a baling-press, a baling-case, a head-block reciprocably arranged therein, a cylinder secured to said baling-case, a piston-head reciprocably arranged in said cylinder, piston-bars suitably secured to the head-block and said piston-head, a yoke secured in the baling-case, guide-rollers journaled in the yoke between which the piston-bars operate, and a stop-pin extending transversely through said piston-bars adapted to contact with said yoke.

10. In a baling-press, a baling-case, a head-block reciprocably arranged therein, a cylinder secured to said baling-case, a piston-head reciprocably arranged in the cylinder, piston-bars secured to said piston-head, a toggle pivotally secured to the head-block and said piston-bars, and a roller against which said toggle contacts.

11. In a baling-press, a baling-case, a head-block reciprocably arranged therein, a cylinder secured to said baling-case, a piston-head reciprocably arranged in the cylinder, piston-bars secured to said piston-head, a transverse pin 29 riveted to said piston-bars, a toggle pivotally secured to the head-block and said piston-bars the rear end of which contacts with pin 29 when said toggle is extended, a roller with which the toggle contacts and whereby said toggle is assisted in unfolding, and means for assisting the toggle to fold.

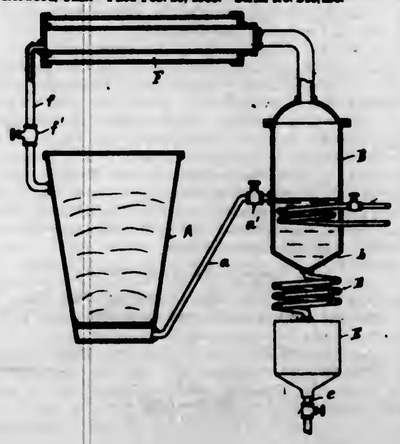
12. In a baling-press, a baling-case, a head-block arranged to travel therein, longitudinal flanges secured to said head-block, and rollers mounted in the baling-case beneath which said flanges travel.

13. In a baling-press, a baling-case, a head-block arranged to travel therein, longitudinal flanges secured to said head-block having inturned upper edges, and a pair of rollers journaled in the baling-case, beneath which said flanges travel.

14. In a baling-press, a baling-case, a yoke secured therein, and rollers journaled in said yoke.

15. In a baling-press, a baling-case, a yoke secured therein composed of a U-shaped portion and a transverse portion secured to the upper terminals of said U-shaped portion, and guide-rollers journaled in said yoke.

808,997. CONCENTRATOR FOR SOLUTIONS. JOHN U. LLOYD, Norwood, Ohio. Filed Feb. 20, 1905. Serial No. 246,424.



Claim.—1. The combination of a concentrating-tank, a heating-coil located within the tank near its bottom, an external coil communicating with the tank below the heating-coil, and a means for keeping the level of the liquid in the concentrating-tank around the heating-coil.

2. The combination of a concentrating-tank, a heating-coil located therein near its bottom, an external coil communicating at one end with the concentrating-tank below the heating-coil, and a reservoir at the other end of the external coil.

3. The combination of a concentrating-tank, a heating-coil within the concentrating-tank near its bottom, a reservoir located below the concentrating-tank, and an external coil connecting the top of the reservoir and the bottom of the concentrating-tank.

4. The combination of a concentrating-tank, a heating-coil within the concentrating-tank near the bottom thereof, an external coil communicating with the concentrating-tank below the level of the heating-coil, a means of holding the fluid in the concentrating-tank at the level of the heating-coil, a steeping-tank, a means of communication between the steeping-tank and the concentrating-tank, a condenser and means for connecting the condenser with the top of the concentrating-tank and with the steeping-tank.

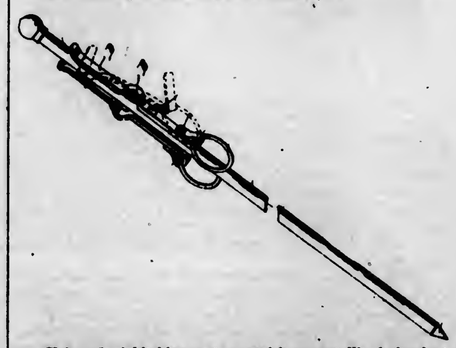
808,998. METHOD OF MANUFACTURING SIDING. CHRISTIAN LOBTSCHER, Dubuque, Iowa. Filed Apr. 19, 1904. Serial No. 203,868.

Claim.—1. A method of manufacturing siding, consisting in producing a plank, seasoning it, ripping it to form strips, molding a groove in each corner of one edge and a groove in the center of the opposite edge of the strip, and finally cutting the strip into four siding-boards by sawing it in two centrally, the saw-cut extending parallel to the side surfaces of the strip, and sawing each of the halves on a diagonal line, said lines on the two halves converging toward each other.

2. A method of manufacturing siding, consisting in producing a plank, seasoning it, ripping it to form strips, molding a groove in each corner of one edge and a groove in the center of the opposite edge of the strip, and finally cutting the strip into four siding-boards by sawing it in two centrally on a line parallel to the side surfaces of the strip, and bisecting the central groove and sawing each of the halves on a diagonal line from the point near the ungrooved corner of each half to a point near the opposite corner thereof, said diagonal saw-cuts dividing each half into two exactly similar siding-boards.

3. A method of manufacturing siding, consisting in producing a plank by sawing, seasoning the blank, then ripping it to form strips of uniform width, resawing the strips in three directions to make four siding-board blanks, placing two of the blanks thus produced together with their freshly-sawed surfaces outward, and finally finishing said freshly-sawed surfaces.

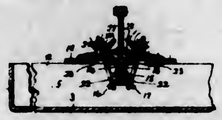
808,999. HITCHING-POST. WILEY H. LOGUEN, Birmingham, Ala. Filed Sept. 27, 1905. Serial No. 280,370.



Claim.—1. A hitching-post, comprising a metallic shaft adapted to be driven into the ground, bars fastened at positions diametrically opposite upon said shaft, with the upper portions of said bars forming resilient clamps, and rings fastened to the lower ends of said bars, as set forth.

2. A hitching-post, comprising a metallic shaft, bars fastened to said shaft at positions diametrically opposite, the upper ends of said bars forming resilient clamps and the lower ends of the bars bent to form loops, and rings engaged by said loops, as shown and described.

808,000. METALLIC RAILWAY-TIE AND MEANS FOR SECURING RAILS THERETO. FRANK G. METCALF, Southbury, Conn. Filed Oct. 2, 1905. Serial No. 280,941.



Claim.—1. The herein-described sheet-metal railway-tie comprising a bottom, ends, sides, and side flanges, said side flanges being inclined downward from the upper edge of said sides.

2. The herein-described sheet-metal railway-tie comprising a bottom, ends, sides, and side flanges, said side flanges being inclined downward from the upper edge of said sides, and rail-plates secured to said flanges the edges of the plates being inclined corresponding to the inclination of said flanges.

3. The herein-described sheet-metal railway-tie comprising a bottom, ends, sides, and side flanges, said side flanges being inclined downward from the upper edge of said sides, and rail-plates secured to said flanges, said plates formed in two parts the inner edges extending downward and terminating in outwardly-extending hooks.

4. The combination with a sheet-metal railway-tie having a bottom, ends, sides, and downwardly-extending side flanges, plates secured thereto, said plates formed in two parts and having the inner edges extending downwardly and terminating in outwardly-extending hooks, said plates also formed with clearance-slots, clips adapted to bear upon the face of said plate and formed with inwardly-extending jaws, and bolts passing through said clips and slots in said plates and formed at their inner ends with eyes to set over said hooks, substantially as described.

808,001. EYEGLASSES. REIL B. MEYROWITZ, New York, N. Y., assignor to The Meyrowitz Manufacturing Co., a Corporation of New Jersey. Filed Mar. 11, 1905. Serial No. 249,259.

Claim.—1. An eyeglass-post comprising a substantially rectangular block having a transverse slot therethrough adapted to support the retaining parts of the eyeglass, the base of the slotted part having a central threaded bore and the top wall of the slotted part having a bore adapted to receive the head of a screw inserted into said bore, the top and sides of the slotted part having a pair of kerfs substantially tangential to said bore in the top, one on each side thereof.

2. An eyeglass-post comprising a substantially rectangular block having a transverse slot therethrough adapted to support the retaining parts of the eyeglass, the base of the slotted part having a central threaded bore and the top wall of the slotted part having a bore adapted to receive the head of a screw inserted into said bore, the top and sides of the slotted part having a pair of kerfs substantially tangential to said bore in the top, one on each side thereof, and a kerf in the top and sides intermediate of said kerfs and parallel therewith, the members produced by the kerfs being bendable to and from the bore in the top.

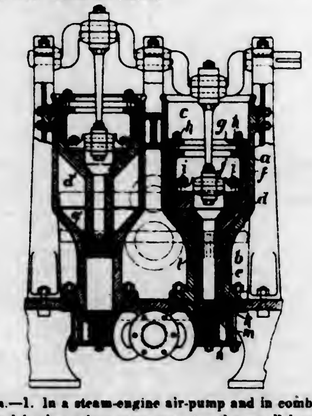
3. An eyeglass-post comprising a substantially rectangular block having a transverse slot therethrough adapted to support the retaining parts of the eyeglass, the base of the slotted part having a central threaded bore and the top wall of the slotted part having a bore adapted to receive the head of a screw inserted into said bore, the top and sides of the slotted part having a pair of kerfs substantially tangential to said bore in the top, one on each side thereof, the members produced by the kerfs being bendable to and from the bore in the top.

4. An eyeglass-post comprising a substantially rectangular block having a transverse slot therethrough adapted to support the retaining parts of the eyeglass, the base of the slotted part having a central threaded bore and the top wall of the slotted part having a bore adapted to receive the head of a screw inserted into said bore, the top and sides of the slotted part having a pair of kerfs substantially tangential to said bore in the top, one on each side thereof, and a kerf in the top and sides intermediate of said kerfs and parallel therewith, the members produced by the kerfs being bendable to and from the bore in the top.

5. An eyeglass-post having a central threaded bore in the base, a pair of flanges on the base, one on each side of the bore and having alining passages therethrough for supporting the retaining parts of the eyeglass, a screw fitted in said bore and having its head engaged by the flanges, and upright pieces on the base on each side of the bore between the flanges and engaging the screw-head by their upper portions.

6. An eyeglass-post having a central threaded bore in the base, a pair of flanges on the base, one on each side of the bore and having alining passages therethrough for supporting the retaining parts of the eyeglass, a screw fitted in said bore and having its head engaged by the flanges, and upright pieces on the base on each side of its bore having transverse end portions extending into engagement with the said screw-head.

808,002. AIR-PUMP. DAVID MILLS, East Rand, Transvaal. Filed Mar. 3, 1905. Serial No. 248,238.



Claim.—1. In a steam-engine air-pump and in combination, a pump-barrel having a large upper part and a small lower part, a valveless piston working in the upper part, from the under side of which extends a plunger working in the lower part, an inlet-valve for the upper part, outlet-valves for the upper and lower parts respectively, and means for making communication between the lowest point of the upper part and the lower part at or near the termination of the suction-stroke and for breaking the communication at or near the commencement of the discharge-stroke.

2. In a steam-engine air-pump and in combination, an open-topped upper cylinder having a conical bottom surmounting a smaller cylinder, a piston working in, and corresponding in shape to the larger cylinder, from the under side of which piston extends a plunger working in the smaller cylinder, vertical ports formed in the upper part of the smaller cylinder adapted to be uncovered by the plunger at or near the end of the suction-stroke and to be again covered by it at or near the commencement of the discharge-stroke, an inlet and an outlet valve communicating by a common port with the under side of the larger piston and a valve for discharging from under the plunger; substantially as hereinbefore described and illustrated by the accompanying drawings.

808,003. CARRIER FOR BARRELS AND THE LIKE. JOHN MITCHELL, Dannemora, N. Y. Filed May 24, 1905. Serial No. 262,004.

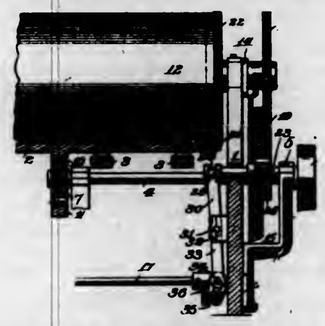
Claim.—1. A carrier for barrels and the like comprising duplicate sets of pivotally-connected handles adapted to be carried to a downward inclination with reference to each other, segmental grappling members loosely suspended therefrom, and sets of rods crossing each other and movably connected at their ends to the ends of said segmental members and the under sides of the handles of each set, respectively.

2. A carrier for barrels and the like comprising duplicate sets of handles constructed at their adjacent ends with mortise-and-tenon joints and connected by a pivot, the inner ends of the handles of one set being beveled downwardly and outwardly, loosely-supported segmental grappling members occupying a position beneath the lower edges of the handles, and means loosely connecting the ends of each of said members with the under side of the handles of the set opposite thereto.

3. A carrier for barrels and the like comprising duplicate sets of handles constructed at their adjacent ends with mortise-and-tenon joints and connected by a pivot, the inner ends of the handles of one set being beveled downwardly and outwardly, loosely-supported segmental grappling members occupying a position beneath the lower edges of the handles, and crossed rods loosely connecting the ends of each of said members with the under side of the handles of the set opposite thereto.

4. A carrier for barrels and the like comprising duplicate sets of handles constructed at their adjacent ends with mortise-and-tenon joints and connected by a pivot, the inner ends of the handles of one set being beveled downwardly and outwardly, loosely-supported segmental grappling members occupying a position beneath the lower edges of the handles, and crossed rods loosely connecting the ends of each of said members with the under side of the handles of the set opposite thereto, portions of the rods of one set being bent to provide clearance for corresponding portions of the rods of the other set.

809,004. MECHANISM FOR PRINTING-PRESSES. JOHN J. MOSHER, Rochester, N. Y. Filed Dec. 19, 1904. Serial No. 237,362.



Claim.—1. In a printing-press, the combination with a reciprocatory bed, a revoluble cylinder coöperating therewith and rotated thereby when said bed is traveling in one direction, of a gear-wheel attached to the cylinder, a second gear-wheel adapted to coöperate therewith, devices driving it independently of the bed, means for moving the last-mentioned gear-wheel into and out of engagement with the first and mechanism for driving the bed.

2. In a printing-press, the combination with a reciprocatory bed, a revoluble cylinder, a rack on the bed and a gear-wheel on the cylinder coöperating when the bed is traveling in one direction, of means for disengaging said parts when the bed is traveling in the opposite direction, another gear-wheel attached to the cylinder, a driven gear-wheel adapted to coöperate therewith, means for rotating it and separate means for operating the driven gear-wheel into and out of operative engagement with the other simultaneously with the disengagement and engagement respectively of the coöperating rack and gear-wheel and means for operating the bed.

3. In a printing-press, the combination with a reciprocatory bed, a cylinder coöperating therewith and driven thereby when moving in one direction and a gear-wheel attached to the cylinder, of a laterally-movable gear-wheel having a segmental face at one side and adapted to coöperate with the gear-wheel on the cylinder when the latter is disengaged from the bed, means for shifting the laterally-movable gear and mechanism for driving it and the bed.

4. In a printing-press, the combination with a reciprocatory bed, a cylinder coöperating therewith and driven thereby when moving in one direction and a gear-wheel attached to the cylinder, of a driven gear-wheel coöperating with the gear-wheel on the cylinder and having a laterally-extending segmental face, means for shifting the driven gear and causing the disengagement of the bed and cylinder and means for operating the bed and driven gear.

5. In a printing-press, the combination with a reciprocatorybed, a cylinder coöperating therewith and driven thereby when moving in one direction and a gear-wheel attached to the cylinder, of a driven gear-wheel coöperating with the gear-wheel on the cylinder and having a laterally-exteading segmental face, means for causing an engagement and disengagement of the bed and cylinder and a shifting of the driven gear laterally into and out of alinement with the gear-wheel on the cylinder when the segmental face is in engagement therewith.

809,005. PANELED GOODS-RECEPTACLE. JOSEPH I. MCVOY, Chicago, Ill. Filed Sept. 11, 1905. Serial No. 277,975.

Claim.—1. In combination with a box of the character described, provided with a panel-covered flanged opening, a device for fastening the panel in place, comprising a guide member formed of a back having flanged sides and upper and lower loops, said member being secured at its flanges to the inner surface of the box-wall adjacent to the opening therein and a stop member reciprocably confined between said back and loops and provided with a handle, for the purpose set forth.

2. In combination with a box of the character described, provided with a panel-covered flanged opening, a device for fastening the panel in place, comprising a sheet-metal guide member consisting of a back having flanged sides and upper and lower loops forming with the back a guideway, said member being soldered at its flanges to the inner surface of the box-wall adjacent to the opening therein, and a stop member reciprocably confined between said back and loops and provided with a handle on one end and an obstruction on the opposite end, for the purpose set forth.

809,006. BILL FILE AND CABINET. OSMOND A. OSMONDSON, Richmond, Va. Filed Mar. 14, 1905. Serial No. 249,986.

Claim.—1. In filing devices, a main clamp-plate formed of sheet metal and provided with a continuous edge flange, the flanges at the opposite sides of the plate being approximately at a right angle to such plate, while the flange at the lower end of the plate is formed by curving or inclining the sheet metal from the rear face to approximately the edges of the side flanges to form a relatively sharp

introducing edge, and a secondary spring-pressed clamp supported by said main clamp-plate.

2. In filing devices, a main clamp-plate having a continuous edge flange, the lower portion of said plate being arranged on a curved or inclined line to form a relatively sharp introducing edge, and means projecting outward from the plate at points near the opposite lower corners thereof to space the clamp of which it forms a part from the next adjacent clamp.

3. In filing devices, a main clamp-plate, a secondary clamping member, and a spring connecting the two clamping members and having one end arranged to form an impaling-tooth.

4. In filing devices, a main clamp-plate having a continuous edge flange, the lower portion of the side flanges being extended outward and thence bent transversely to form spacing-lugs, and a secondary spring-pressed clamp supported by said plate.

5. In filing devices, a main clamp-plate having a continuous marginal flange, a secondary clamping member, and a spring connecting the two clamping members and having one end arranged to form an impaling-tooth.

6. In a filing device, a main clamp-plate having a continuous marginal flange, a secondary clamping member having an enlarged opening, and a spring passing through openings in the two clamping members and connecting the same, that portion of the spring to the rear of the main clamp-plate extending into the opening of the secondary clamping member.

7. In filing devices, a main clamp-plate, a secondary clamp-plate, both plates being provided with parallel slits, and the metal between the slits of the secondary clamp-plate being depressed to form a pocket, and a spring extending through the slits and seated in the depressed portion, one end of the spring being arranged to form an impaling-tooth.

8. In filing devices, a pair of clamping members having parallel slits, a spring extending through the slits and connecting said members, the rear end of the spring being seated under the secondary clamp and being provided with an opening, and a securing-tongue formed by stamping out and bending the metal of the secondary clamp, said tongue extending through the opening of the spring and holding the latter in place.

9. In filing devices, a main clamping member having a continuous marginal flange, tongues projecting from the flange and arranged parallel with the plane of the clamping member, auxiliary tongues formed by stamping out and bending the metal of said clamping member, all of said tongues forming a receiver for a name-card or the like.

10. In a filing device, main and secondary clamping members, and a projecting impaling-tooth extending through an opening in the main clamping member and disposed in a plane oblique to the plane of the clamps, the opening being of such size as to receive a number of impaling members and permit nesting when a number of clamps are assembled.

11. In a filing device, a main clamping member, a secondary clamping member, both clamping members having parallel slits, and the metal between the slits of the secondary clamping member being depressed, a spring-strip extending through the slits and seated in the depression, an intermediate portion of the strip extending between the two clamps, and projecting lugs or shoulders on said strip for preventing independent longitudinal movement of the same.

12. In filing devices, a main clamping member, an auxiliary clamping member, and a guard having side arms, there being tongues formed by stamping out and bending the metal of the main clamping member, said tongues engaging with and holding the arms in place.

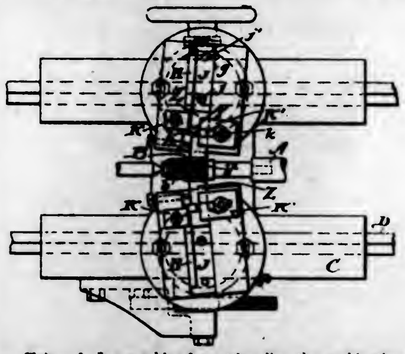
13. In filing devices, the combination with a main and auxiliary clamping member, of a guard, having crimped side arms, and holding-tongues stamped from the metal of the main clamp and bent over said arms at points on opposite sides of such crimped portions.

14. In filing devices, the combination with main and auxiliary clamping members, of a guard, including a cross-bar and side arms, the cross-bar being bent over to form an engaging portion in a plane above the plane of the side arms.

15. In filing devices, the combination with main and auxiliary clamping members, of a guard formed of a strip of metal, the opposite ends of which are bent at a right angle to the central or body portion of the strip.

16. In filing devices, a main clamp-plate having a continuous edge flange, lugs adjacent to the edges of the plate, and a secondary spring-pressed plate supported by said plate, the lugs and spring-pressed plate forming spacing members for a number of assembled filing devices.

809,007. **MACHINE FOR CUTTING DIES FOR DIE-STOCKS.** HERMAN W. OSTER, Cleveland, Ohio, assignor to The Oster Manufacturing Company, Cleveland, Ohio, a Corporation of Ohio. Filed Apr. 17, 1905. Serial No. 256,094.



Claim.—1. In a machine for cutting dies, the combination of a rotatable cutter, a carriage movable in a path parallel to the axis of the cutter, a pair of plates upon said carriage on opposite sides of the cutter and simultaneously adjustable toward and from each other, a pair of die-holding blocks mounted respectively on vertical axes upon said plates and having die-holding recesses in their top faces adapted to hold dies on their flat sides extending radially from the cutter, means for holding said blocks immovable upon said plates, clamps for holding the dies in said recesses, and means for automatically causing the plates to separate at a predetermined point in the feed movement of the carriage.

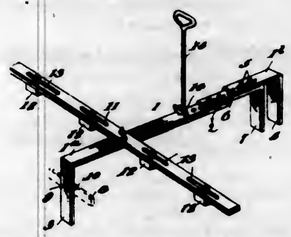
2. The combination of a frame, a carriage mounted to slide thereon, holders transversely mounted on the carriage, a right and left hand screw mounted on the carriage and operating said holders, mechanism mounted on the carriage for turning said screw, and an arm secured to the frame and adapted to engage with and operate the screw-turning mechanism when the latter is brought in contact with said arm by the movement of said carriage.

3. The combination with the frame, a rotatable cutter, a carriage mounted on the frame and slidable parallel with the axis of the cutter, a pair of holders mounted on the carriage on opposite sides of the cutter, mechanism mounted on the carriage and operating to move the holders toward or from each other, a pinion for operating said mechanism, a geared member engaging said pinion, and a projection carried by said geared member and adapted to engage a projection carried by the frame.

4. The combination of the frame, a carriage slidable thereon, a pair of die-holders mounted on the carriage and transversely movable, a right and left hand screw transversely mounted in the carriage, a pinion on the shaft of said screw, a gear mounted on the carriage and engaging said pinion, a projection adjustably connected to said gear and a coöperating projection carried by the frame of the machine.

5. The combination of the frame, a carriage slidable thereon, die-holders transversely movable upon said carriage, a right and left hand screw journaled in the carriage, a pinion on said screw, a gear engaging said pinion, an arm journaled concentrically with said gear, an arcual undercut groove in said gear, a T-headed bolt seated in such groove and clamping the arm to the gear, a projection carried by said arm and a coöperative projection mounted on the frame.

809,008. **TIE LINER AND SPACER.** WILLIAM T. PAGE, Iron City, Ga. Filed May 31, 1905. Serial No. 263,061.



Claim.—1. In a tie liner and spacer for tracks, the combination of a gage-bar having a tie-engaging member, rail-engaging members carried by said gage-bar, and a transverse tie-spacing bar.

2. In a tie liner and spacer for tracks, the combination of a gage-bar having a tie-engaging member, rail-engaging members carried by said gage-bar, a transverse tie-spacing bar, and a plurality of tie-spacing members adjustably mounted upon said tie-spacing bar.

3. In a tie liner and spacer for tracks, the combination of a gage-bar composed of adjustably-connected sections, a tie-engaging member projecting from one section, spaced rail-engaging members carried by the other section, and a transverse tie-spacing bar mounted upon the gage-bar.

4. In a tie liner and spacer for tracks, the combination of a gage-bar composed of adjustably-connected sections, a tie-engaging member projecting from one section, adjustably-spaced rail-engaging members carried by the other section, a transverse spacing-bar mounted upon the gage-bar, and tie-spacing blocks adjustably mounted upon the tie-spacing bar.

5. In a tie liner and spacer for tracks, the combination of a gage-bar composed of adjustable sections, tie and rail engaging members carried by said gage-bar, a transverse tie-spacing bar, and a handle for the gage-bar.

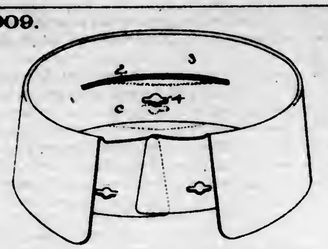
6. In a tie liner and spacer for tracks, the combination of a gage-bar composed of adjustable sections, tie and rail engaging members carried by said gage-bar, a transverse tie-spacing bar, a handle for the gage-bar, and a pivoted rest carried by the tie-engaging member of the gage-bar.

7. In a device of the class described, the combination of a gage-bar composed of adjustably-connected sections, a tie-engaging member projecting downwardly from one end of one section, a rail-engaging member projecting from one end of the other section, a plate adjustably mounted upon the second section, and a second rail-engaging member carried by said plate and adjustable toward and from the first-mentioned rail-engaging member.

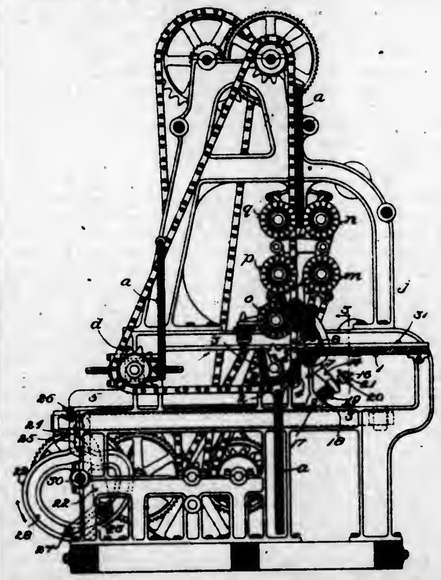
809,009. **COLLAR.** FREDERICK W. PARSONS, Cleveland, Ohio. Filed Mar. 6, 1905. Serial No. 248,418.

Claim.—A lay-down collar having a band and a lay-down portion overlapping the band at its outside, and the said band provided with a longitudinal slit in its rear portion forming a flexible strip below said slit and having a buttonhole at its middle, whereby engagement with the rear collar-button is effected without opening the collar.

809,009.



809,010. **LEATHER-WORKING MACHINE.** FRANKLIN J. PERKINS, Woburn, Mass., assignor, by mesne assignments, to Turner Tanning Machinery Company, Boston, Mass., a Corporation. Filed Feb. 9, 1904. Serial No. 193,777.



Claim.—1. In a machine of the character described, in combination, a table or support for the hide or skin, means to move it, operating-tools located on opposite sides of the path of movement of the said table or support, a carrier for the hide or skin coöperating with one of said tools to effect working of a portion of said hide or skin prior to the engagement of the hide or skin with said table or support, and a clamp to engage the hide or skin while on the carrier and prevent its movement under the influence of the tool coöperating with said carrier, substantially as described.

2. In a machine of the character described, in combination, a substantially flat table or support for a hide or skin, means to move it, operating-tools located on opposite sides of the path of movement of said table or support, a second support for the hide or skin movable substantially at right angles to the path of movement of the said table and coöperating with one of said operating-tools to effect working of a portion of the hide or skin while on said second support, and means coöperating with said second support to secure the hide or skin thereon against movement under the influence of the operating-tool which coöperates with said second support, substantially as described.

3. In a machine of the character described, in combination, a table or work-support, means to move said table in a substantially vertical path, operating-tools located on opposite sides of the path of movement of said table or work-support, a yielding support over which a hide or skin is adapted to be placed, movable toward and from the path of movement of said table, means for treating the hide

or skin while on said yielding support, and a clamp to hold the hide or skin

side by side, and made solid with each other, a projecting plate

on the support of steam into a number of small jets and reduces its ve-

or skin while on said yielding support, and a clamping-bar coöperating with the upper end of said yielding support, substantially as described.

4. In a machine of the character described, in combination, a table or work-support, means to move it, a carrier for a hide or skin movable toward the path in which said table is moved to place the hide or skin into position to be removed from said carrier by said table, means to move said carrier, means for treating the hide or skin while on said carrier, means for treating the hide or skin while on said table, and a clamp coöperating with said carrier to resist movement of the hide or skin while undergoing treatment on said carrier, said clamp being automatically actuated by said carrier to engage the hide or skin thereon, substantially as described.

5. In a leather-working machine, in combination a movable table or support, means to move the said table, operating-tools for working a hide or skin on said table, a carrier and an operating-tool for working a portion of a hide or skin on said carrier prior to the engagement of the hide or skin with the movable table, and a clearer to engage that portion of the hide or skin rearward of the carrier and position said portion for proper engagement of the hide or skin with the said movable table or support.

6. In a leather-working machine, in combination a movable table or support, means to move said table, operating-tools for working a hide or skin on said table, a horizontally-movable carrier and means for moving it, and an operating-tool for working a portion of a hide or skin on said carrier prior to the engagement of the hide or skin with the movable table, and a clearer to engage that portion of the hide or skin rearward of the carrier and position said portion for proper engagement of the hide or skin with the said movable table or support.

7. In a leather-working machine, in combination a movable table or support for a hide or skin, means to move it, operating-tools located on opposite sides of the path of movement of the said table, and means on opposite sides of the path of movement of said table to support the free ends of the hide or skin away from the sides of said table, said means comprising a pivoted portion of the work-support on one side of the table, and the carrier on the other side of the table, substantially as described.

8. In a leather-working machine, in combination a movable table and means for moving it, operating-tools coöperating with said table to work a hide or skin thereon, a horizontal work-support, a horizontally-moving carrier, a coöperating tool for working a portion of a hide or skin on said carrier and a moving clearer for clearing the edge of said hide or skin from said work-support as the carrier moves toward the operating-roll which coöperates therewith.

9. In a leather-working machine, in combination a movable table and means for moving it, operating-tools coöperating with said table to work a hide or skin thereon, a horizontal work-support having stripes thereon separated by intermediate spaces a horizontally-moving carrier, a coöperating tool for working a portion of a hide or skin on said carrier, and a moving clearer comprising a series of fingers projecting into the spaces between the stripes on said work-support for clearing the edge of said hide or skin from said work-support as the carrier moves toward the operating-roll which coöperates therewith.

10. In a leather-working machine, in combination, a movable table and means for moving it, tools coöperating with said table to work a hide or skin thereon, a horizontal work-support having a trough or depression at the rear side thereof, a horizontally-moving carrier, a coöperating tool for working a portion of a hide or skin on said carrier, and a moving clearer for clearing the edge of said hide or skin from said support as the carrier moves toward the operating-roll which coöperates therewith, and means for accelerating the motion of the clearer at the end of its movement to throw the edge of the hide or skin into the trough or depressed portion of the work-support, substantially as described.

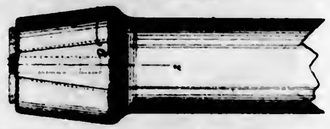
11. In a leather-working machine, in combination a movable table, means for moving it, tools coöperating with said table to work a hide or skin thereon, a horizontal work-support, a moving carrier, a coöperating tool for working a portion of a hide or skin on said carrier, and a holder coöperating with said carrier to securely hold the hide or skin thereon while it is being operated upon by the coöperating tool, substantially as described.

12. In a leather-working machine, in combination a movable table, means for moving it, tools coöperating with said table to work a hide or skin thereon, a horizontal work-support, a moving carrier, a coöperating tool for working a portion of a hide or skin on said carrier, and a yielding holder coöperating with said carrier to securely hold the hide or skin thereon while it is being operated upon by the coöperating tool, substantially as described.

13. In a leather-working machine, in combination a movable table, means for moving it, tools coöperating with said table to work a hide or skin thereon, a horizontal work-support, a moving carrier, a coöperating tool for working a portion of a hide or skin on said carrier, a holder coöperating with said carrier to securely hold the hide or skin thereon while it is being operated upon by the coöperating tool, and a moving clearer for clearing the edge of said hide or skin from said work-support as the carrier moves toward the operating-tool which coöperates therewith.

14. In a leather-working machine, in combination a movable table and means for moving it, tools coöperating with said table to work a hide or skin thereon, a horizontal work-support having a depression or trough rearwardly thereof and hinged leaf or portion intermediate the said horizontal portion of the work-support and the said trough and forming an inclined side of the latter, a horizontally-moving carrier, a coöperating tool for working a portion of a hide or skin on said carrier, and means for moving the edge or rear portion of the hide or skin in advance of the carrier and depositing it in the trough of the work-support, substantially as described.

809,011. **BOTTLE-SEAL.** ANDREW B. PRIER, New York, N. Y. Filed June 6, 1905. Serial No. 264,945.

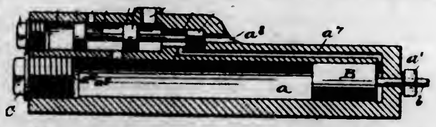


Claim.—1. A bottle-seal comprising a key-plate slidable on one side of the bottle-neck, and a sealing-strip passing over the bottle-closure and interlocking with said key.

2. In a bottle-seal, a bottle having a channel in its neck portion opening outward at the top, the opposite walls of the channel being undercut and converging upward, a key slidable in said channel and conforming thereto, the said key having a shoulder in its inner side, and a sealing-strip for passing over the bottle-stopper and into said channel and having a hook end for engaging said shoulder.

3. In a seal, a bottle having opposite vertically-disposed channels provided with undercut side walls, converging upward, key-plates slidable in said channels and conforming thereto, said key-plates having channels in their inner sides terminating in shoulders, and a sealing-strip for passing over the bottle-closure, the ends thereof being passed through said channels, and terminating in upwardly-extended portions for engaging with said shoulders.

809,012. **VALVE MECHANISM.** JAMES M. RAIKES and EDWARD W. RAIKES, Cleveland, Ohio. Filed Dec. 19, 1904. Serial No. 237,417.



Claim.—1. In a valve mechanism, the combination of a cylinder, a piston adapted to reciprocate therein, a valve-chamber, a piston-valve occupying said chamber and having three heads, two of the heads being of different area and the third head having an area greater than such difference, and passage ways from the valve-chamber to the cylinder, leading as follows when the valve is at the outer end of its stroke, a passage-way to one end of the cylinder leading from a point between the heads of different area, a passage-way to the other end of the cylinder leading from a point between the other two heads, and a passage-way to an intermediate part of the cylinder from a point beyond the large-headed end of the valve.

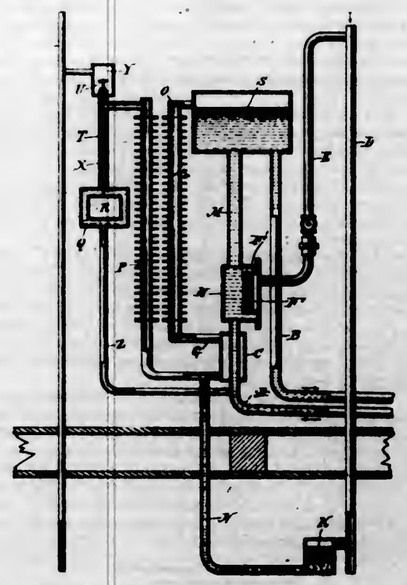
2. The combination of a cylinder, a valve-casing, a pair of passage-ways leading from the valve-casing to the cylinder, a piston-valve occupying the valve-casing and having three heads, one of which is smaller than the other two, said valve being adapted to stand with one of said passage-ways between such small head and the next head, and the other passage-way between the other two heads, an admission passage-way between the heads when the valve is in each position, an exhaust passage-way controlled by the small head, and an additional passage-way from the cylinder to the valve-casing beyond the large end of the valve when so positioned.

3. The combination of a cylinder and a cylindrical valve-casing

side by side, and made solid with each other, a reciprocating piston within the cylinder, a piston-valve comprising three heads and a connecting-stem adapted to be inserted through the end of the valve-casing, means for closing such end, a passage-way from near one end of the valve-casing to near the end of the cylinder, a passage-way from an intermediate part of the valve-casing to near the other end of the cylinder, and a passage-way from near the other end of the valve-casing to an intermediate part of the cylinder, an admission passage-way to the valve-casing between two of the heads of the valve, and a pair of exhaust passage-ways leading from the chamber, one beyond the smallest head and the other intermediate of the two other heads.

4. The combination of a cylinder, a tubular valve-casing adjacent thereto, said valve-casing comprising a cylindrical chamber and a smaller cylindrical extension, a passage-way from the extension to the cylinder near one end, an exhaust passage-way from the extension, a passage-way from the main valve-casing to the cylinder near the other end, a passage-way from near the end of the main valve-casing to an intermediate point in the cylinder, a piston-valve having a stem and a pair of heads of the same diameter occupying said main valve-chamber, said stem extending into said extension, a smaller head on the stem within the extension, an admission-opening in the chamber between the smaller head and the next adjacent head, an exhaust-opening from the cylinder between the two larger heads of the valve.

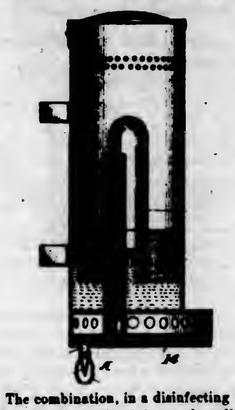
809,013. **HOT-WATER-CIRCULATING APPARATUS.** ANDERS B. RECK, Copenhagen, Denmark. Filed Jan. 31, 1896. Serial No. 668,618.



Claim.—1. In an apparatus for water circulation, comprising a flow-pipe, radiators, and a return-pipe from the radiators, the combination of a steam-supply pipe, a heating-tank provided with an inlet for steam, a pipe rising from the heating-pipe, a separator-tank connected with the rising-pipe and provided with an outlet for steam and water, a condenser connected with said outlet and located adjacent to said return-pipe, said condenser being adapted to conduct heat to the return-pipe, an outlet-pipe for air and excess steam leading from the steam-chamber of the condenser, a condensation-pipe in communication with said steam-chamber, and a water seal through which said condensation-pipe communicates with the steam-supply pipe to prevent the passage of steam from the supply-pipe to the condenser.

2. In an apparatus for water circulation, comprising a flow-pipe, radiators, and a return-pipe from the radiators, the combination of a steam-supply pipe, a heating-tank provided with an inlet for steam, a subdividing device located at the steam-inlet to break up the current of steam into a number of small jets and reduce its velocity, a pipe rising from the upper part of said heating-tank, a separator-tank connected to the upper end of said rising-pipe and provided with an outlet for steam and water, a condenser connected with said outlet located adjacent to said return-pipe and adapted to conduct heat thereto, an outlet-pipe for air and excess steam leading from the steam-chamber of the condenser, and a condensation-pipe in communication with said steam-chamber and with the steam-supply pipe, said condensation-pipe having a water seal to prevent the passage of steam from the supply-pipe to the condenser.

809,014. **DROPPER FOR DISINFECTING APPARATUS.** WILLIAM H. ROSS, Baltimore, Md. Filed May 18, 1905. Serial No. 261,003.



Claim.—1. The combination, in a disinfecting apparatus, with a fluid-tank and means for maintaining a slow discharge of fluid therefrom, of a dropping device comprising an open discharge-tube and a relatively slender solid point depending therefrom and from which the fluid drops.

2. The combination, in a disinfecting apparatus, with a fluid-tank and means for maintaining a slow discharge of fluid therefrom, of a dropping device connected with the discharge-opening of said apparatus and comprising a slender solid depending point from which the fluid drops.

3. The combination, in a disinfecting apparatus, with a fluid-tank and means for maintaining a slow discharge of fluid therefrom, of a dropping device connected with the discharge-opening of said apparatus and comprising a slender solid depending point from which the fluid drops, and a casing surrounding said point, for the purpose set forth.

809,015. **CHAIN.** SOLOMON SCHINDALL, New York, N. Y. Filed Mar. 31, 1905. Serial No. 253,690.

Claim.—1. A chain device, comprising a plurality of parallel chains placed side by side, the links of the separate chains forming transverse series of links, and the adjacent transverse series of links being connected by a single cross-link the side portions of which are passed through the links of the said two adjacent series of transverse links, substantially as shown and described.

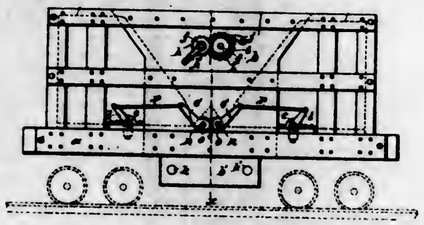
2. A chain device, comprising a plurality of parallel chains placed side by side, the links of the separate chains forming transverse series of links, and the adjacent transverse series of links being connected by a single cross-link the side portions of which are passed through the links of the said two adjacent series of transverse links, and the links of the parallel chains being curb-links, substantially as shown and described.

3. A chain device, comprising a plurality of separate parallel curb-chains placed side by side and the links of which are twisted so that the sides thereof cross, the corresponding links of each chain being connected by a single transverse link, the side portions of which are passed therethrough, said chain device being also provided at the ends with transverse links which connect the corresponding links of the separate chains, and short chains connected with the transverse links, a number of the short chains being less

than the number of the first-named chains which make up the body of the device, substantially as shown and described.

4. A chain device, comprising a plurality of separate parallel curb-chains placed side by side and the links of which are twisted so that the sides thereof cross, the corresponding links of each chain being connected by a single transverse link, the side portions of which are passed therethrough, said chain device being also provided at the ends with transverse links which connect the corresponding links of the separate chains, and short chains connected with the transverse links, a number of the short chains being less than the number of the first-named chains which make up the body of the device, some of the links of the body of the device being longer than others and being connected by a single transverse link, substantially as shown and described.

809,016. **DUMPING-CAR.** PETER SCHNEIDER, Cowego, N. Y. Filed Aug. 28, 1905. Serial No. 276,018.



Claim.—1. A car-body composed of a stationary central section formed of two side plates, a stationary chute attached at its ends to the bottom portions of said side plates, and end sections pivotally supported to tilt automatically from the chute, in combination with transverse shafts pivotally supported in the aforesaid side plates, arms attached to said shafts, means connecting said arms to the inner ends of the end sections, means for turning the shafts to lift the end sections into normal position and locking devices for retaining the end sections in normal position.

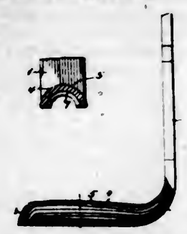
2. A car-body composed of a stationary central section formed of side plates, a stationary chute attached at its ends to said side plates, and end sections mounted near the center of their length on transverse shafts to tilt automatically from the chute, in combination with shafts pivoted at their ends in the aforesaid side plates, arms attached to said shafts, means connecting said arms to the inner ends of the end sections, means for turning said shafts to lift the end sections into normal position, intermeshing gears pivotally supported at one side of the central body-section, arms extending from said gears toward the adjacent end sections, cranks attached to the supporting-shafts of said end sections, and rods connecting said cranks to the arms of the gears as and for the purpose set forth.

3. A car-body composed of a stationary central section formed of side plates extending below the body, a stationary chute extending across the center of the body and attached to the aforesaid side plates, and end sections mounted near the center of their length, on transverse shafts and tilting automatically from the chute, in combination with shafts pivoted at their ends in the aforesaid side plates, arms attached to said shafts, means connecting said arms to the inner ends of the end sections, intermeshing gears attached to said shaft, means for locking said gears and maintaining the end sections in their normal position, stops secured to the bottom extensions of the stationary side plates to limit the tilting of the end sections, intermeshing gears pivotally supported at one side of the central section, arms extending from said gears toward the adjacent end sections, cranks attached to the supporting-shafts of the said end sections, and rods connecting said cranks to the arms of the gears as set forth and shown.

809,017. **WARDROBE-HOOK.** BENJAMIN S. SCHAEFER, Columbus, Ohio. Filed Feb. 20, 1905. Serial No. 246,926.

Claim.—1. A wardrobe-hook comprising a vertical member and a rounded and broadened garment-supporting member of approximately uniform width throughout its length and inclined rearwardly toward the vertical member and having its rounded and broadened surface gradually merged rearwardly into the vertical member.

2. A wardrobe-hook comprising a vertical member and a rounded and broadened garment-supporting member of approximately uniform width throughout its length and inclined rearwardly toward the vertical member and having its rounded and broadened surface gradually merged rearwardly into the vertical member, the said garment-supporting member having its outer or forward end broadened and rounded and turned down.



809,018. **ROLLER STAMPING DEVICE.** WILLIAM SCOTT, New York, N. Y., assignor to Kaumograph Co., New York, N. Y. Filed July 15, 1905. Serial No. 269,870.

Claim.—1. A roller stamping device comprising a hand-frame, a roller-stamp journaled thereon and provided in its peripheral face with a mark in intaglio, and an ink-fountain held on the said hand-frame adjacent to the said roller-stamp, the ink-fountain having a doctor in engagement with the peripheral face of the said roller-stamp.

2. A roller stamping device comprising a hand-frame, a roller-stamp journaled thereon and provided in its peripheral face with a mark in intaglio, an ink-fountain held on the said hand-frame adjacent to the said roller-stamp, the ink-fountain having a doctor in engagement with the peripheral face of the said roller-stamp, the said ink-fountain being pivoted on the frame, and means pressing the said fountain to hold the doctor with more or less force in contact with the roller.

3. A roller stamping device comprising a hand-frame, a roller-stamp journaled thereon and provided in its peripheral face with a mark in intaglio, an ink-fountain held on the said hand-frame adjacent to the said roller-stamp, the ink-fountain having a doctor in engagement with the peripheral face of the said roller-stamp, the said ink-fountain being pivoted on the frame, a spring-arm extending from the said ink-fountain, and an adjusting device on the frame and engaging the said spring-arm.

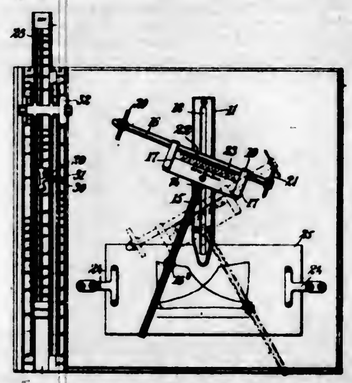
4. A roller stamping device comprising a hand-frame, a roller-stamp journaled thereon and provided in its peripheral face with a mark in intaglio, an ink-fountain held on the said hand-frame adjacent to the said roller-stamp, the ink-fountain having a doctor in engagement with the peripheral face of the said roller-stamp, and a spring-arm held in the frame and provided with a locking-pin engaging a recess in one end of the said roller-stamp to lock the latter against rotation until released and to automatically lock the roller-stamp on the completion of a revolution.

809,019. **DEVICE FOR CALCULATING HORSE-POWER.** BUCKEE M. SOUTHAM, Waipahu, Hawaii. Filed Jan. 31, 1905. Serial No. 243,497.

Claim.—1. A calculating device comprising a pair of scales, one being provided with a stationary gage-point, and a slide having a scale adapted to register with one of the first-mentioned scales and provided with a rider slidably mounted thereon and adapted to register with the other stationary scale and with the gage-point.

2. The combination with a support, of a slide-rule thereon having two stationary scales, and a slide provided with a scale and with a rider slidably mounted thereon and adapted to register with one of said stationary scales.

3. A calculating device, comprising a pair of scales, one representing mean effective pressures in horse-powers, and the other representing cylinder diameters, the second scale being provided with a stationary gage-point, a slide having a scale adapted to register with the first-mentioned scale and provided with a rider slidably mounted thereon and adapted to register with the second stationary scale and with the gage-point.



4. A device for calculating horse-powers, comprising a stationary scale having divisions representing mean effective pressures and horse-powers, a second stationary scale having divisions representing cylinder diameters and a gage-point among said divisions, and a slide adapted to move along both of said first-mentioned scales and provided with a scale representing revolutions per minute and length of stroke and having a rider slidably mounted thereon adapted to register with the second of said stationary scales and with said gage-point.

809,020. **SWIVEL.** FRANK W. SEIDL, Manitowoc, Wis. Filed Apr. 6, 1905. Serial No. 254,269.

Claim.—1. A swivel comprising a body portion with branches, a hook screw-threaded and mounted to turn in one of said branches, and a sleeve mounted to slide upon the other branch and to cover the end of the hook when closed, said other branch having a socket to receive said hook.

2. A swivel comprising a body portion with branches, a hook portion having a shank screw-threaded and mounted to turn in one of said branches, the other branch having at its free end a socket to receive said hook portion, a sleeve mounted to slide upon the other branch, and a spring within said branch adapted to be put under compression by the movement of said sleeve.

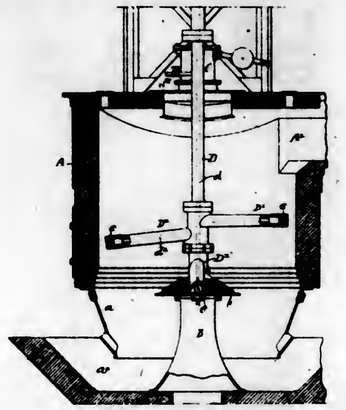
3. A swivel comprising a body portion with branches, one of which is internally threaded and the other having a hollow portion with slotted walls, a hook mounted in the threaded branch and adapted to a socket in the end of the other branch, a sleeve mounted to slide upon the hollow member, and a pin passed through said sleeve and through the slotted walls of the said member, and a spring within the said hollow portion in the path of movement of said spring.

809,021. **PROCESS OF PREVENTING THE FORMATION OF CLINKER IN GAS-PRODUCERS.** JAMES B. SHEAFFER, Dunbham, Pa., assignor of one-half to Orville C. Skinner, Dunbham, Pa. Filed July 27, 1904. Serial No. 218,267.

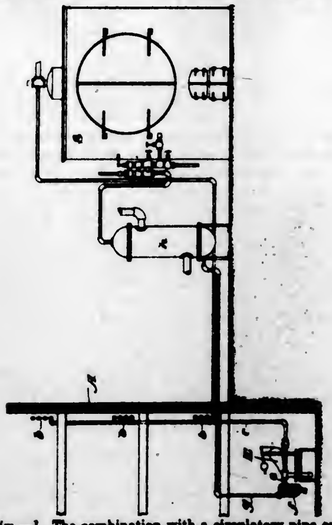
Claim.—1. The mode herein described of preventing the formation of clinker in gas-producers, said mode consisting in injecting jets or streams of water into the incandescent mass of fuel adjacent to the walls of the producer where clinker usually forms, substantially as described.

2. The mode herein described of preventing the formation of clinker on the walls of gas-producers, said mode consisting in projecting jets or streams of water against the walls of the producer at the point where clinker usually forms, substantially as described.

3. The mode herein described of preventing the formation of clinker in a gas-producer, said mode consisting in projecting jets or streams of water into the incandescent mass of fuel in the producer at points adjacent to the walls thereof, and agitating the mass of fuel, substantially as described.



809,022. **AUTOMATIC LIFT-SEPARATOR.** SIDNEY W. SIBERNER, New York, N. Y. Filed Mar. 7, 1904. Serial No. 196,709.



Claim.—1. The combination with a circulatory pipe or system of a steam-trap for lifting the returned water and a lift-separator interposed in the delivery from said steam-trap and comprising relatively large and small connected inlet and outlet chambers for the purpose described.

2. The combination with a pipe or system of a lifting apparatus connected with the same and constructed to lift the water therefrom, and a lift-separator interposed in the delivery of said apparatus to separate the steam from the water flowing through said delivery and assist in lifting the returned water.

3. The combination with a pipe or system of a lifting apparatus connected with the same and constructed to lift the water therefrom, and means interposed in a connection of said apparatus to separate the steam from the water flowing through said connection and to assist the lifting apparatus in the lifting operation.

4. The described lift-separator comprising relatively immovable chambers connected at or near their lower ends, the one serving as an inlet-chamber and having an inlet-opening at its upper end, the other serving as an outlet-chamber and having an outlet-opening at its lower end, said inlet-chamber being relatively larger in capacity than said outlet-chamber.

809,023. **GAS-PRODUCER.** ORVILLE C. SKINNER and JAMES B. SHEAFFER, Dunbham, Pa. Filed Aug. 1, 1904. Serial No. 219,135.

Claim.—1. A gas-producer having a fuel-chamber, a steam-jet pipe extending into the fuel-chamber, and a water-jet pipe extending into the fuel-chamber and having its discharge-end directed toward the steam-jet pipe.

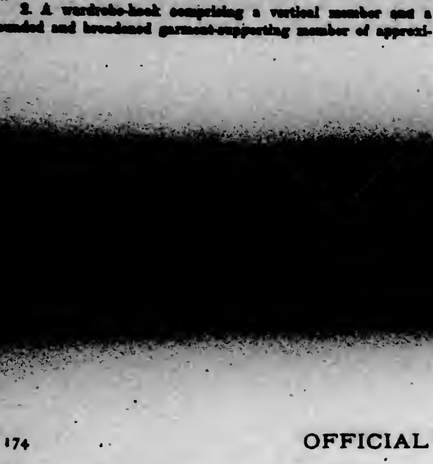
2. A gas-producer having a fuel-chamber, a steam-jet pipe extending into the fuel-chamber, and a water-jet pipe extending into the fuel-chamber and having its discharge-end directed toward the steam-jet pipe, and means for agitating the fuel in the fuel-chamber.

3. A gas-producer having a fuel-chamber, a steam-jet pipe extending into the fuel-chamber, a water-jet pipe extending into the fuel-chamber and having its discharge-end directed toward the steam-jet pipe, and means for agitating the fuel in the fuel-chamber, said means comprising a rotary shaft.

4. A gas-producer having a fuel-chamber, a steam-jet pipe extending into the fuel-chamber, a water-jet pipe extending into the fuel-chamber and having its discharge-end directed toward the steam-jet pipe, and means for agitating the fuel in the fuel-chamber, said means comprising a rotary shaft having a plurality of arms.

5. A gas-producer having a fuel-chamber, a steam-jet pipe extending into the fuel-chamber, a water-jet pipe extending into the fuel-chamber and having its discharge-end directed toward the steam-jet pipe, and means for agitating the fuel in the fuel-chamber, said means comprising a rotary shaft having a plurality of arms, and a plurality of teeth on each arm.

809,024. **CLOTHES-LINE.** ALBERT SMITH, Lincoln, Neb. Filed Aug. 28, 1905. Serial No. 276,035.



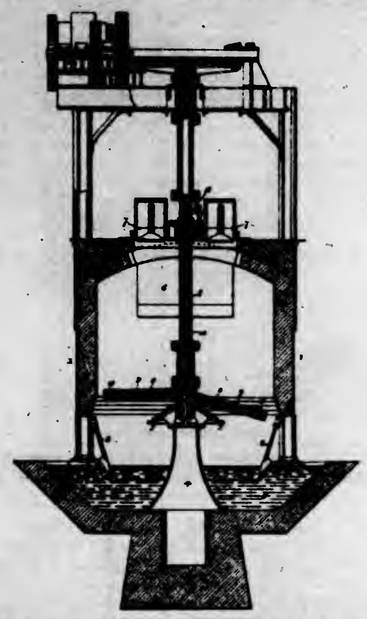
Claim.—1. A clothes-line comprising a carrier, a guide-pulley above and below the pivot-point of the carrier, and a line passing around the guide-pulleys and carrier, substantially as described.

2. A clothes-line comprising a carrier, a guide-pulley above and below the pivot-point of the carrier, and a line passing around the guide-pulleys and carrier, the line passing around the carrier on opposite sides of the pivot-point, substantially as described.

3. A clothes-line comprising a carrier, a guide-pulley above and below the pivot-point of the carrier, and a line passing around the guide-pulleys and carrier, the line passing around the carrier on opposite sides of the pivot-point and the guide-pulleys being arranged on opposite sides of the line, substantially as described.

809,025.

809,028. **GAS-PRODUCER.** CHARLES C. SKINNER and JAMES H. SHAFFER, Durham, Pa. Filed July 27, 1904. Serial No. 218,369.



Claim.—1. The combination in a gas-producer, of a stirring-arm mounted within the producer, the arm having a nozzle through which water is projected into the mass of fuel at the point where clinker usually forms, substantially as described.

2. The combination of a gas-producer with a water-supply pipe mounted within the producer, said pipe having a nozzle adjacent to the inner wall of the producer for projecting a jet or stream of water toward the said inner wall of the producer into the mass of fuel where the clinker usually forms, substantially as described.

3. The combination of a gas-producer having a rotating shaft with hollow arms projecting into the mass of fuel in the producer, and means for discharging jets or streams of water from said arms into the fuel, substantially as specified.

4. The combination of a gas-producer having a rotating shaft with a hollow arm projecting into the mass of fuel in the producer, and means for discharging a jet or stream of water from the outer ends of said arm against the walls of the producer, substantially as described.

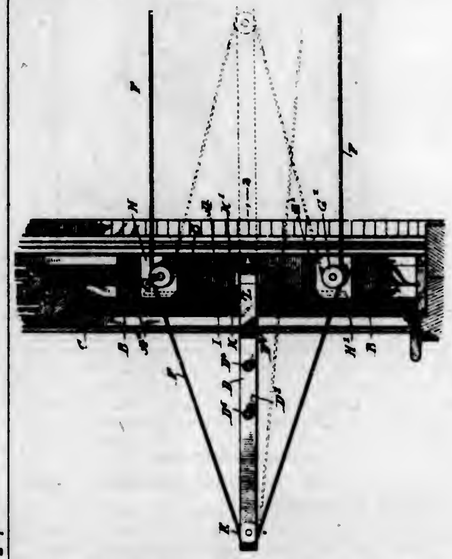
5. The combination of a gas-producer having a hollow rotating water-cooled shaft, with projecting water-cooled arms thereon, and water-discharging nozzles secured to the ends of said arms, substantially as specified.

809,024. **CLOTHES-LINE SUPPORT.** PATRICK J. SLOAN, Bayonne, N. J. Filed June 2, 1904. Serial No. 210,706.

Claim.—1. A clothes-line support comprising an arm mounted to swing horizontally and carrying at its free end a pulley for the passage of the clothes-line, carrier or guide pulleys on the support for the arm, one above and the other below the pivot of the said arm and over which passes the clothes-line to and from the said arm-pulley, and movable carriers for the said guide-pulleys, to allow the carrier or guide pulleys to assume different angles on swinging the arm in or out of the window.

2. A clothes-line support comprising an arm mounted to swing horizontally and carrying at its free end a pulley for the passage of the clothes-line, carrier or guide pulleys on the support for the arm, one above and the other below the pivot of the said arm and over which passes the clothes-line to and from the said arm-pulley, and carrier-plates disposed above and below the pivot of the said arm and mounted to swing up and down, on which plates the said guide-pulleys are mounted to turn.

3. A clothes-line support comprising an arm mounted to swing horizontally and carrying at its free end a pulley for the passage of the clothes-line, carrier or guide pulleys above and below the pivot of the said arm and over which passes the clothes-line to and from the said arm-pulley, movable carriers for the said guide-pulleys, to allow the carrier or guide pulleys to assume different angles on swinging the arm in or out of the window, and a connection between the said carriers and the said arm, for imparting movement to the said carriers on swinging the arm about.



4. A clothes-line support comprising a bracket for attachment to a window, an arm mounted to swing horizontally on the said bracket, a pulley journaled in the free end of the said arm, plates hinged on the bracket above and below the pivot for the said arm, guide-pulleys journaled on the said plates and over which passes the clothes-line to and from the pulley on the said arm, and means on the said arm for imparting a swinging motion to the plates on swinging the arm.

5. A clothes-line support comprising a bracket for attachment to a window, an arm mounted to swing horizontally on the said bracket, a pulley journaled in the free end of the said arm, plates hinged on the bracket above and below the pivot for the said arm, guide-pulleys journaled on the said plates and over which passes the clothes-line to and from the pulley on the said arm, and means on the said arm for imparting a swinging motion to the plates on swinging the arm, the said means consisting of a rod secured to the arm, parallel to the pivot thereof, the upper end of the rod engaging the under side of the upper hinge-plate and the lower end of the rod being formed into a hook engaging a loop on the inner face of the lower hinge-plate.

6. A clothes-line support, comprising a bracket, an arm pivoted to the bracket, a pulley on the outer end of the arm, and hinged guide-pulleys on the bracket, one above and the other below the pivot of the arm and approximately in the same vertical plane therewith.

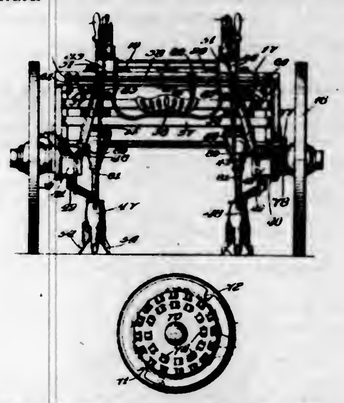
7. A clothes-line support, comprising a bracket, an arm pivoted to the bracket, a pulley on the outer end of the arm, guide-pulleys hinged to the said bracket on opposite sides of the pivot of the arm, and means for swinging the guide-pulleys from the said arm.

8. In a clothes-line support, a pivoted arm having a pulley at its free end, hinged carriers one above and the other below the pivot of the arm, a guide-pulley mounted in each carrier, a rod secured to the arm and operatively engaging the said carriers to swing them as the arm is swung, a loop held to slide on the rod, and keepers with which the loop is adapted to engage.

9. A clothes-line support, comprising a horizontally-swinging arm, a pulley on the outer end of the arm, independently-hinged guides, located a distance above and below the hinged end of the arm, and means for causing the guides to assume different angles on swinging the arm.

10. A clothes-line support, comprising a swinging arm, a pulley on the outer end of the arm, independently-hinged guides arranged on opposite sides of the hinged end of the arm at a distance therefrom, and means for swinging the guides in unison with the arm.

809,025. **INTERCHANGEABLE CULTIVATOR AND SEED-DRILL.** JACOB B. SHELBY, Chicago, Ill. Filed June 13, 1903. Serial No. 161,848.



Claim.—1. In combination, a frame mounted on wheels and having attaching means adapted to receive interchangeably either cultivator mechanism comprising a shovel-carrying bar and a plurality of shovels, or seeder mechanism comprising a suitable dropper and furrow-making device.

2. In combination, an arching axle carried by wheels, attaching means formed on the axle for interchangeably attaching seeder mechanism or cultivator mechanism to the axle, such attaching means comprising loops formed on the cross member of the axle, and loops formed on the uprights of the axle for coöperating with the first-mentioned loops in attaching the seeder mechanism.

3. In combination, a frame comprising an arch-form axle and being mounted on wheels; ways attached to the vertical members of the arch; a frame adapted to move in the ways; a seed-can carried by the latter frame; mechanism for discharging seed from the can; and driving means carried by one of the wheels, with which the seed-discharging mechanism comes into operative engagement when the can-carrying frame is in its lower position.

4. In combination, an arching axle carried by wheels; a rocking crank-shaft journaled on the cross member of the arch; slideways formed on the uprights of the arch; and seeder mechanism carried by the crank-shaft and running in the slideways.

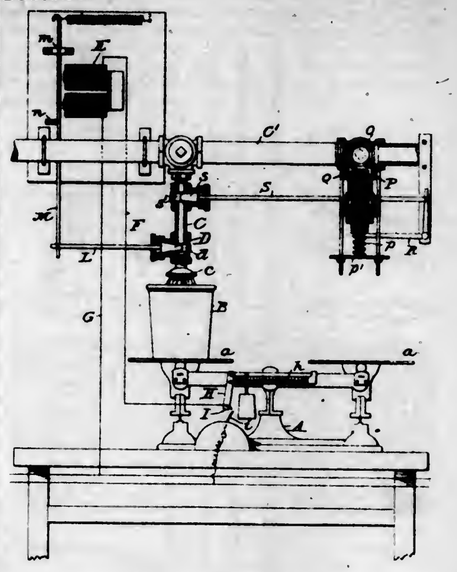
5. In combination, an arch-form axle carried by wheels; a bar pivotally attached to each upright of the axle; means for securing the bar parallel to the upright of the axle; and a seeder-carrying frame adapted to slide between the bar and the axle.

809,026. **ELECTRIC SCALE FOR ACCURATE LARD-WEIGHING.** CHARLES E. SUPPE, Groton, La., assignor to The Southern Cotton Oil Company, Jersey City, N. J., a Corporation of New Jersey. Filed June 25, 1903. Serial No. 163,008.

Claim.—1. In a device for weighing lard and automatically cutting off the flow thereto, the combination with a scale, of a feed-pipe, a valve in said pipe having a valve-rod, a pivoted lever connected to said rod, a spring attached to the end of the lever and acting to open the valve, an electromagnet arranged in connection with said lever and operating to close the valve, and an electric circuit having contacts, one of which is on the scale, so that the circuit may be closed to close the valve when the required delivery of lard or similar material has passed said valve, the movement of the scale thus controlling the magnet.

2. The combination with a scale, of a feed-pipe for delivering lard or similar substance to a receptacle on the scale, a valve in said pipe controlled by an electric circuit which is itself controlled by the movements of the scale, and a pressure-valve likewise in the feed-pipe, together with a pressure-controlling mechanism consisting essentially of a spring-plunger acted on by the pressure in the supply-pipe and opening and closing the aforesaid valve so as to make the quantity of the flow constant.

809,026.



809,027. **HINGE.** JOSEPH SOSS, New York, N. Y. Filed Feb. 16, 1905. Serial No. 245,809.

Claim.—1. A hinge, comprising two plates having oblong, longitudinal and rectangular recesses in one edge thereof and segmentally-curved plates at the inner edges of said recesses, said segmentally-curved plates being projected in opposite directions, one of said segmentally-curved plates being provided at its ends with segmental keepers formed by inwardly-set angular flanges, and the other segmentally-curved plate being provided with outwardly-set segmental flanges adapted to enter said keepers and to slide therein, and means for preventing the separation of the segmentally-curved plates when connected, substantially as shown and described.

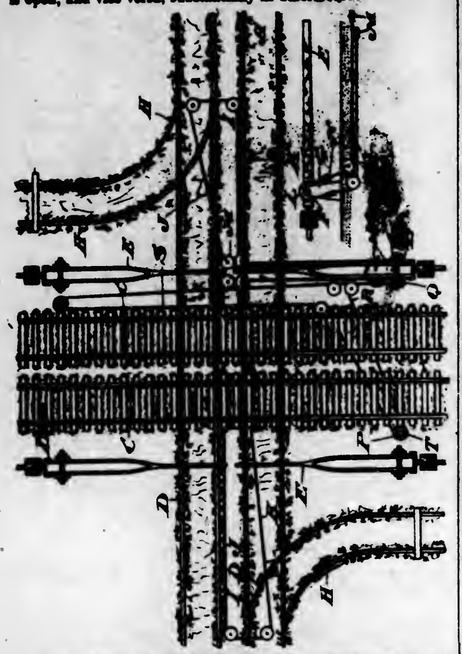
2. A hinge of the class described, comprising two plates each of which is provided in one edge thereof with a longitudinal rectangular recess at the inner side of which is a segmentally-curved plate, one of said segmentally-curved plates being provided at its ends with inwardly-set flanges forming segmental keepers which open upwardly and downwardly, and the other segmentally-curved plate being provided at its ends with outwardly-set flanges which extend upwardly and downwardly and which are adapted to enter and move in said keepers, said segmentally-curved plates being adapted to slide freely one within the other, substantially as shown and described.

3. A hinge of the class described, comprising two plates, each of which is provided in one edge with a longitudinal rectangular recess at the inner side of which is a segmentally-curved plate, one of said segmentally-curved plates being provided at its ends with inwardly-set segmental keepers and the other segmentally-curved plate being provided at its ends with flanges adapted to enter and move in said keepers, said segmentally-curved plates being also provided when connected, one with an inwardly-directed lug or projection near its free edge and the other with an outwardly-directed lug or projection near its free edge, substantially as shown and described.

809,028. **AUTOMATIC SAFETY RAILWAY-CROSSING.** THOS. SOWERS, Mariposa township, Ontario, Canada. Filed Apr. 20, 1905. Serial No. 256,048.

Claim.—1. In a device of the class described the combination of a railway-track; a swinging gate transverse of the track; a switch connecting with the track and located at one side of the gate; means

for opening and closing the switch; and connecting means between the gate and the switch whereby when the gate is closed the switch is open, and vice versa, substantially as described.



2. In a device of the class described the combination of a railway-track; a swinging gate transverse of the track; a switch connecting with the track and located at one side of the gate; means for opening and closing the switch; connecting means between the gate and the switch whereby when the gate is closed the switch is open, and vice versa; and a stop in the line of the switch, substantially as described.

3. In a device of the class described the combination of a railway-track; a swinging gate transverse of the track; a switch connecting with the track and curved out laterally; means for opening and closing the switch; and connecting means between the gate and the switch whereby when the gate is closed the switch is open, and vice versa, substantially as described.

4. In a device of the class described the combination of a right of way; a road crossing said right of way; railway-tracks on said road; a swing-gate transverse of the roadway at each side of the right of way; a switch at each side of the crossing, connecting with the main line, and curved out laterally; means for opening and closing the switches; and connecting means between each switch and a gate, whereby when the gate is closed the switch is open, and vice versa, substantially as described.

5. In a device of the class described the combination of a railway-track; a swinging gate transverse of the track; a switch connecting with the track and located at one side of the gate; means for opening and closing the switch; a drum on the same spindle as and rocking with the gate; two cables connected to opposite sides of the drum and opposite sides of the switch opening and closing means; and guide-pulleys for said cables, whereby when the gate is closed the switch is open, and vice versa, substantially as described.

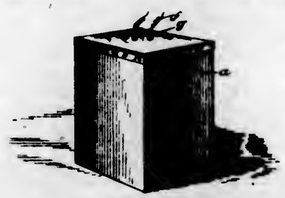
6. In a device of the class described the combination of a railway-track; a swinging gate transverse of the track; a switch connecting with the track and located at one side of the gate; means for opening and closing the switch; a drum on the same spindle as and rocking with the gate; two cables connected to opposite sides of the drum and opposite sides of the switch opening and closing means; guide-pulleys for said cables, whereby when the gate is closed the switch is open, and vice versa; and a draft-spring in the cable adapted to open the switch, substantially as described.

7. In a device of the class described the combination of a right of way; a road crossing said right of way; railway-tracks on said road; a swing-gate transverse of the roadway at each side of the right of way; a switch at each side of the crossing, connecting with the main line and curved out laterally; means for opening and closing the switches; two drums on the same spindle as and rocking with one of the gates; two cables connected to opposite sides of one of the drums and opposite sides of the opening and closing means of one of the switches; similar cables similarly connected to the other drum and switch opening and closing means; and guide-pulleys for said cables, whereby when the gate is closed the switch is open, and vice versa, substantially as described.

8. In a device of the class described the combination of a right of way; a road crossing said right of way; railway-tracks on said road; a swing-gate transverse of the roadway at each side of the right of way; a switch at each side of the crossing, connecting with the main line, and curved out laterally; means for opening and closing the switches; connecting means between each switch and a gate, whereby when the gate is closed the switch is open, and vice versa; a signal-lamp adapted to show a danger-signal along the road and a safety-signal along the right of way, and vice versa; and means operated by a gate to move said signal-lamp, substantially as described.

9. In a device of the class described the combination of a right of way; a road crossing said right of way; railway-tracks on said road; a swing-gate transverse of the roadway at each side of the right of way; a switch at each side of the crossing, connecting with the main line, and curved out laterally; means for opening and closing the switches; connecting means between each switch and a gate, whereby when the gate is closed the switch is open, and vice versa; a signal-lamp adapted to show a danger-signal along the road and a safety-signal along the right of way, and vice versa; a pulley on the signal-lamp; a drum on the same spindle as and rocking with the aforesaid gate; two cables connecting the pulley and the drum; and guide-pulleys for the said cables, substantially as described.

809,029. **SIGNAL.** ROBERT STANFORD and PARKER R. COLPITT, Halifax, Canada. Filed Aug. 19, 1904. Serial No. 221,301.



Claim.—1. A signal comprising a fusible case containing an illuminant charge, a destructible case therein containing a priming charge, a fuse leading from the priming to the illuminant charge, and means extending into the destructible case for igniting the priming charge to light the fuse.

2. A signal, comprising a case of lead, containing an illuminant charge, a destructible case therein containing a priming charge, a fuse for the priming charge leading through the bottom of said destructible case and thence to the illuminant charge, and means for igniting the priming charge.

3. A signal comprising a case containing an illuminant charge, another case therein containing a priming charge, a fuse leading from the priming charge to the illuminant charge, an igniter embedded in the priming charge, and an electric circuit of which the said igniter forms a part.

4. A signal comprising a case containing an illuminant charge, and another case therein containing a priming charge, a fuse leading from the priming charge to the illuminant charge, insulating-tubes passing through said first-named case to the interior of the second-named case, an electric igniter embedded in the priming charge, and electric conductors passing through said tubes and having electrical connection with the said igniter, the latter and said conductors forming parts of an electric circuit.

809,080. **TURNBUCKLE.** JOSEPH A. STEINMETZ, Philadelphia, Pa. Filed June 6, 1904. Serial No. 211,269.

Claim.—1. A turnbuckle comprising tubular portions, having closed inner ends and adapted to receive and protect the ends of the tie-rods, means at the outer ends of said portions for engaging with rods and an annular portion intermediate said tubular portions.

2. A turnbuckle comprising tubular portions, means at the outer ends of said tubular portions for engaging with the rods and an apertured member intermediate said tubular portions, the ends of the latter adjacent said member being closed.

809,031. **CHURN.** FREMEN SWALLOW, Claremore, Ind. Ter., assignor of one-fourth to Lee Settle, one-fourth to Morris Haas, and one-fourth to Joseph B. Poland, all of Claremore, Ind. Ter. Filed Feb. 17, 1905. Serial No. 246,041.

Claim.—1. In a churn, the combination with a dasher provided with upwardly-extending obliquely-arranged tubes, of a tubular dasher-shaft connected thereto, an air-tube extending into the tubular dasher-shaft and having a collecting-hood at its upper end with means for rotating the dasher-shaft and air-tube.

2. In a churn the combination with a rotary dasher, of a tubular dasher-shaft, connected thereto, an air-tube extending into the tubular dasher-shaft, a hood arranged upon the upper end of the air-tube, gears connected to the dasher-shaft and air-tube, a gear adapted to mesh with the said gears carried by the shaft and tube, together with means for supporting the said driving mechanism upon the churn-body, as set forth.

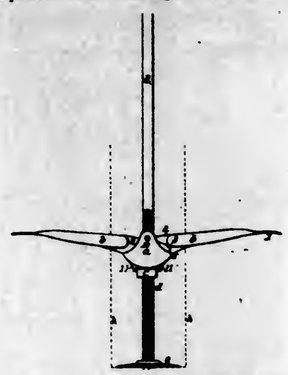
3. In a churn, the combination with the central casting, of the arms hinged thereto, each arm having its rear end upset, a pin connected to said upset end, a flanged sleeve slidable upon each arm, and a spring surrounding the pin and adapted to bear upon the upset end of the arm and the flange of the sleeve, together with a dasher-shaft passing through the central casting and means arranged upon the said central casting for rotating the dasher-shaft, as set forth.

4. In a churn, the combination with a dasher, of the tubular dasher-shaft, an air-tube, extending into the dasher-shaft, a hood arranged upon the upper end of the air-tube, the gears carried by the dasher-shaft and air-tube, a gear meshing with the said gears carried by the tube and shaft, the standard and bracket-arms for supporting said gears, the central casting carrying the standard, the arms hinged thereto and having upset ends, the pins connected to said upset ends, the flanged sleeves sliding upon the hinged arms, and the springs surrounding the pins and bearing upon the flanges of the sleeves as and for the purpose described.

5. In a churn, the combination with a dasher-shaft, of a casting supporting said shaft provided with hinged arms, each arm being provided with spring-actuated sleeves adapted to engage the edge of the churn and means carried by said casting for the purpose of operating the dasher-shaft, as set forth.

809,082. **EARTH-ANCHOR.** GEORGE F. SWORTHWOOD, Newark, N. J. Filed Aug. 1, 1905. Serial No. 272,510.

Claim.—1. The combination in an earth-anchor of a supporting-body, earth-penetrating blades hinged thereto, the blades having hinge-lugs with notches in their back edges to form catches against the supporting-body, the ends of the lugs extended to engage with the opposite blades when the blades are wide open, the blades comprising broad surfaces terminating in rounded and outwardly-curved points, an anchor-bolt passing through the supporting-body between the blades, there being a long thread on said bolt, a nut on the bolt below the supporting-body, there being lugs on the under side of said body to prevent the turning of the nut, and projections on the under side of said body for insertion in holes in an earth-plate, and an earth-plate as a thrust-bearing for the bolt.



2. In an earth-anchor as shown, a supporting-body with hinge-lugs, a hole through the center of the body for the anchor-bolt, a long threaded anchor-bolt, a nut on the bolt below said body, there being lugs on the under side of said body to prevent turning of the nut, and there being projections on the under side of the body to engage with holes in an earth-plate, an earth-plate to engage with the projections on the supporting-body and containing a recess for the end of the anchor-bolt, blades with upturned edges for penetrating the soil with rounded and curved points, having hinge-lugs pivoted to the lugs of the supporting-body, the lugs provided with notches for engagement with the supporting-body, and extended ends for engagement with opposite blades when the blades are wide open.

3. An earth-anchor with soil-penetrating blades pivoted to a movable support as set forth, an anchor-bolt provided with a long thread extending through the anchor, a nut on the bolt held from turning by means on the anchor-blades, support, and an earth-plate to receive the thrust of the bolt.

4. An earth-anchor with soil-penetrating blades pivoted to a movable support, an anchor-bolt provided with a long thread extending through the anchor, a nut on the bolt below the anchor, there being lugs on the anchor to prevent the turning of the nut, there being projections on the anchor to temporarily hold an earth-plate by engagement with holes in said plate, and an earth-plate to receive the thrust of the bolt.

5. In combination with a anchor-bolt, an anchor movable by means of a long-threaded bolt through the anchor and a nut on the bolt under the anchor, the bolt thrusting against a fixed plate, separated from the anchor whereby the anchor is caused to rise by turning the bolt.

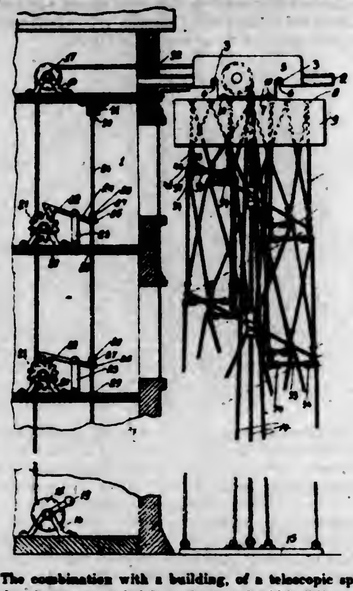
809,088. **FIRE-ESCAPE.** WILHELM F. TIEDE and FLORIAN OTT, Allegheny, Pa. Filed June 8, 1905. Serial No. 264,594.

Claim.—1. The combination with a building, of a collapsible metallic spiral stairway supported from the outside of the building near the top thereof, said collapsible stairway consisting of a plurality of spirally-arranged steps adapted to telescope one another, a platform suspended at the base of said steps and from the top of said stairway, means contained within said building to elevate said platform to telescope said steps, means to lock said steps in a telescoped position, means to shield said steps in said position, and means mounted within said building and actuated from the floor of the building to release said steps.

2. The combination with a building, of a shell supported upon the outside of said building near the top thereof, a spirally-arranged metallic stairway suspended from said shell, a platform supported by the base of said stairway, means mounted within said building to elevate said base and said stairway into said shell, and means carried within said building to release said stairway and said platform, substantially as described.

3. The combination with a building of a spirally-arranged telescopic stairway suspended from the top of said building and adapted

to be normally retained in a telescoped position, means to shield said stairway in said position, means actuated from each floor of said building to release said stairway, and means mounted within said building to telescope said stairway, substantially as described.



4. The combination with a building, of a telescopic spirally-arranged stairway suspended from the top of said building, means to normally hold said stairway in a telescoped position, and means to release said stairway, substantially as described.

5. In a fire-escape, a plurality of telescopic steps spirally arranged and adapted in their movement in one direction to operate by gravity, and means for positively moving the steps in the opposite direction.

6. A fire-escape of the character described consisting of a plurality of spirally-arranged telescopic steps adapted to be suspended from a building.

7. In a fire-escape, a suitably-supported shell, a spirally-arranged stairway suspended from said shell, and comprising a series of telescoping steps, means for normally holding said stairway in a telescoped position and means to release said stairway.

8. In a fire-escape, a plurality of telescopic spirally-arranged steps, adapted to be suspended in the form of a spiral stairway, and means for suspending said steps.

9. In a fire-escape, a suitably-suspended telescopic spiral stairway, and means to normally retain said stairway in the telescoped position.

10. In a fire-escape, a suitably-suspended telescopic spirally-arranged stairway, and means for shielding said stairway when in its telescoped position.

11. In a fire-escape, a telescopic spirally-arranged stairway, means for retaining said stairway normally in the telescopic position, and means for releasing said stairway.

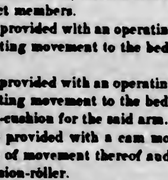
12. In a fire-escape, a plurality of spirally-arranged telescopic steps.

809,084. GOLF-BALL. WILLIAM I. THOMAS, Chicago, Ill. Filed May 8, 1905. Serial No. 259,310.

Claim.—1. In a golf-ball, the combination with a core, consisting of windings arranged in layers, alternate layers being under relatively less tension than the intermediate layers, and a cover inclosing said core.

2. In a golf-ball, the combination with a center piece, of a core composed of windings arranged in layers surrounding said center piece, alternate layers being under greatly-increasing tension but under less tension than the intermediate layers, and a cover inclosing said core.

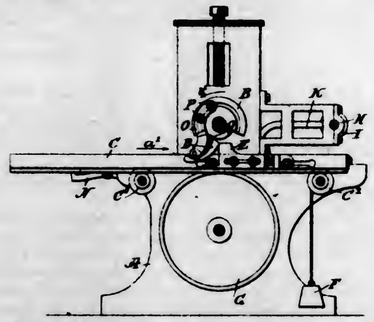
809,085. GOLF-BALL. WILLIAM I. THOMAS, Chicago, Ill. Filed May 8, 1905. Serial No. 260,320.



Claim.—1. In a golf-ball, the combination with a core composed of windings arranged in layers the inner and outer layers being wound under greater tension than the intermediate layer, and a cover inclosing said core.

2. In a golf-ball, the combination with a center piece, of a core composed of windings arranged in layers, the tension of the layer adjacent the center piece and that of the outer layer being greater than the tension of the windings of the intermediate layer, and a cover surrounding said core.

809,086. PLATE-PRESS. ROBERT TURNER, New Canaan, Conn., and BENJAMIN R. CORLEY, New York, N. Y. Filed Jan. 21, 1905. Serial No. 242,060.



Claim.—1. A plate-press provided with an arm on the impression-roller, and a cam on the bed, the said arm and cam having yieldingly-mounted contact members.

2. A plate-press provided with an operating-arm on the impression-roller, for imparting movement to the bed, the said arm being yieldingly mounted.

3. A plate-press provided with an operating-arm on the impression-roller, for imparting movement to the bed, the said arm being pivoted, and a spring-cushion for the said arm.

4. A plate-press provided with a cam mounted on the bed to yield in the direction of movement thereof and adapted to be actuated from the impression-roller.

5. A plate-press provided with a cam mounted to slide on the bed, and a spring-cushion for the said cam whereby the cam can yield in the direction of movement of the bed.

6. In a plate-press, the combination with the impression-roller and the bed, of an arm pivoted on the impression-roller, a cushion for the said arm, a cam slidably mounted on the said bed and adapted to be engaged by the said arm, and a cushion for the said cam.

7. In a plate-press, the combination with the impression-roller and the bed, of an arm pivoted on the impression-roller, a cushion for the said arm, means for limiting the swinging motion of the said arm, a cam slidably mounted on the said bed and adapted to be engaged by the said arm, and a cushion for the said cam.

8. A plate-press provided with an impression-roller, a bed, and

connecting yielding means on the bed and roller for imparting a traveling motion to the said bed from the impression-roller.

9. A plate-press provided with an impression-roller, a bed, and yielding means for imparting the traveling motion to the said bed from the impression-roller and for forming a cushioning-step for the bed on its return movement.

10. In a plate-press, the combination with the impression-roller and the bed, an arm for operating the bed, said arm being pivotally connected with the impression-roller, means for limiting the swinging motion of the arm, and a cushion for said arm.

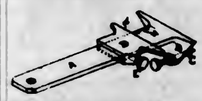
11. In a plate-press, the combination with the impression-roller and the bed, of a bracket carried by the impression-roller, an arm for operating the bed, said arm being pivoted to the bracket, a link connection between the arm and the bracket, and a cushion on the bracket between said bracket and arm.

12. In a plate-press, the combination with the impression-roller, and the bed, of a bracket adjustably secured to the impression-roller, an arm for operating the bed, said arm being pivoted at one end to the bracket, a slotted link connecting the arm with the bracket, and cushion on the bracket between said bracket and arm.

13. In a plate-press, the combination with the impression-roller and an arm carried thereby, of a bed, a bracket on the bed and provided with a projection, a cam mounted to slide on the bracket, and a cushion interposed between the cam and the projection of the bracket.

14. In a plate-press, the combination with the impression-roller, and an arm carried thereby, of a bed, a bracket adjustably secured to the bed and provided with a projection, a cam mounted to slide on the bracket, and cushion in the form of rubber blocks, one secured to the cam and the other to the projection of the bracket.

809,087. GAGE FOR CUTTER-HEADS. ELBER A. WALKER, Saratoga Springs, N. Y. Filed June 17, 1905. Serial No. 265,696.



Claim.—1. An adjustable gage for cutter-heads; comprising a plate; a right-angled projecting block at the end thereof; a sliding plate adapted to reciprocate on that side of said first-mentioned plate opposite that from which said block projects; an adjusting-screw in said block; a set-screw in said sliding plate.

2. An adjustable gage for cutter-heads; comprising a plate; one end of which is adapted to be placed beneath the projecting portion of a cutter-blade; a right-angled projecting block at the end of said plate extending from the side of said plate opposite that upon which said cutter-blade is adapted to rest; an adjusting-screw in said block; a sliding plate upon the side of said first-mentioned plate that the cutter-blade is adapted to rest upon; a set-screw in said sliding plate,

3. An adjustable gage for cutter-heads; comprising a plate; a right-angled projecting magnetized block at the end thereof; an adjusting-screw in connection with said block; a sliding plate adapted to reciprocate on said first-mentioned plate along the side thereof opposite to that from which said block extends; a set-screw in said sliding plate, substantially as described.

809,088. TRAP-NEST FOR LAYING HENS. CHARLES B. WILLIAMS, Ontario, Cal. Filed Mar. 20, 1905. Serial No. 250,960.

Claim.—1. A trap-nest embodying a main frame or body open at the front, an apertured gate-frame laterally slidable across said front, a vertically-slidable wicket for closing the aperture in the gate when lowered, means for supporting the wicket elevated, and means for releasing the wicket so that it drops when a fowl enters the aperture in the gate.

2. A trap-nest embodying a slatted rectangular frame open at the front, an apertured gate-frame laterally slidable across said open front, a vertically-slidable wicket mounted upon the gate-frame, closing its aperture when lowered, a trip-plate carried by the gate-frame near the lower defining edge of the aperture therein, and means connecting the wicket and trip-plate and adapted to release the wicket, said means being actuated by the tread of a fowl on the trip-plate.

3. A trap-nest embodying a slatted rectangular frame open at the front, an apertured gate-frame laterally slidable across said open front, a slatted wicket vertically slidable on the gate-frame, means carried on said gate-frame for supporting the wicket elevated and the aperture uncovered, and means mounted upon the lower portion of the gate-frame and engaging the supporting means, the engaging means being actuated by the tread of a fowl passing through the aperture in the gate-frame.

4. A trap-nets embodying a slatted rectangular frame open at the front, a partition dividing the interior of the frame into a trap-chamber and a nest-chamber, said partition having a doorway therein near its rear end, a weighted trap-door hung in the doorway and normally opened by the weight thereon, a main door slidable across the open front ends of the two adjacent chambers, an apertured gate slidable across the front of the nest-chamber rearward of the main door, a wicket slidable vertically on the gate and, when lowered, closing the aperture therein, means for holding the wicket raised, a nest-box in the nest-chamber, means, actuated by the tread of a fowl entering the nest-chamber through the opening in the gate, for releasing the wicket that falls by gravity, and means for closing the weighted trap-door, actuated by the fowl entering the trap-chamber through the doorway guarded by said trap-door.

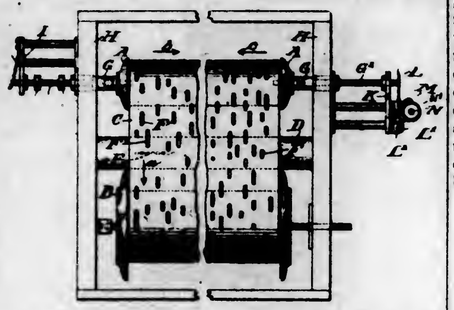
5. In a device of the character described, the combination with a slatted rectangular frame, open at the front and divided into compartments by a partition, of a main slatted door slidably held at the front and adapted for closure of the compartments, an apertured gate slidable at the front of the frame rearward of the main door, and adapted to partially close one compartment at its open front when the main door is open, a vertically-slidable wicket mounted upon the inner side of the gate, a trip-plate held to rock on the lower portion of the gate, a trigger-rod upwardly extended from the trip-plate and rocking therewith, and a projection on the wicket, engaged by the upper end of the trigger-rod, thus holding the wicket raised, a downward rocking movement of the trip-plate caused by the tread of a fowl releasing the wicket, that drops by gravity for closure of the aperture in the gate.

6. In a device of the character described, the combination with a slatted rectangular frame open at the front, a partition dividing the frame into compartments, said partition having a doorway near the rear end thereof, and means for temporarily closing the front, of a counterweighted door pivoted in the doorway, a hinged bottom board in one of said compartments, and a link-rod pivoted at its ends on the bottom board and on the counterweighted door, said door being rocked downward and held for the closure of the doorway by weight imposed upon the bottom board.

809,089. PNEUMATIC-ACTION OF MUSICAL INSTRUMENTS. HERMAN S. WARNER, Worcester, Mass., assignor to Aeolian Company, a Corporation of Connecticut. Filed Mar. 13, 1903. Serial No. 147,622.

Claim.—1. In a pneumatic-actuated musical instrument, the combination with one of the rolls for a perforated music-sheet capa-

ble of longitudinal movement, of a lever having one end pivoted to the frame of the instrument and its free end bearing against one end of said roll, a cam adapted to contact with said lever between its pivoted end and the end of said roll, and means for retaining the end of said roll in contact with said lever.



2. In a pneumatic-actuated musical instrument, the combination with one of the rolls for a perforated music-sheet capable of longitudinal movement, of a lever having one end pivoted to the frame of the instrument and its free end bearing against one end of said roll, a cam adapted to contact with said lever between its pivoted end and the end of said roll, and a spring bearing against the opposite end of said roll.

3. In a pneumatic-actuated musical instrument, the combination with one of the rolls for a perforated music-sheet capable of longitudinal movement, of the pivoted lever L bearing against said roll, and the cam M contacting with the lever L between its pivot and its contact with said roll.

4. In a pneumatic-actuated musical instrument, the combination with one of the rolls for a perforated music-sheet having extended bearings and capable of longitudinal movement, of a cam operatively connected with one of said bearings, a spring for reversing the movement of said roll, and means for limiting the longitudinal movement of said extended bearings.

5. In a pneumatic-actuated musical instrument, the combination with one of the rolls for a perforated music-sheet capable of longitudinal movement, of a lever having one end pivoted to the frame of the instrument and its free end bearing against one end of said roll, a cam adapted to contact with said lever between its pivoted end and the end of said roll, a spring bearing against the opposite end of said roll, and means for limiting the longitudinal movement of said roll.

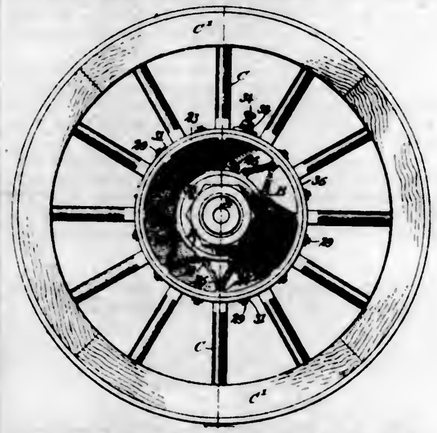
6. In a pneumatic-actuated musical instrument, the combination with one of the rolls for a perforated music-sheet capable of longitudinal movement, a cam arranged to move said roll in one direction, means between said cam and said roll for multiplying the movement of said cam, and a spring for reversing the movement of said roll.

809,040. VEHICLE-WHEEL. MANUEL G. BARRO, New York, N. Y. Filed Mar. 6, 1905. Serial No. 248,479.

Claim.—1. In vehicle-wheels, an inner and an outer hub, one mounted loosely around the other, said outer hub being provided with gearing on the peripheral surface of the inner rib of the hub, a circular pneumatic tube fitted in the outer hub and having constant bearing upon the main hub by means of an endless band intervening between the two, a hollow bolt in connection with said pneumatic tube, and chains connecting the two hubs, which chains are in independent series, acting in opposite directions.

2. In vehicle-wheels, two spaced hubs, one surrounding the other and having movement to and from the other, an intermediate circular pneumatic tube jacketed in one hub and having bearing upon the other hub, means for supplying the said pneumatic tube with air, devices for preventing lateral movement of the surrounding hub, which devices are carried by the hub surrounded, series of chains attached to both hubs, the chains of both series being diagonally arranged but inclined in opposite directions, corresponding chains for the two series forming a triangle widest at the inner hub, dust-guards for the two hubs, means for securing the dust-guards in position, and a driving-gear carried by one of the hubs, as set forth.

3. In vehicle-wheels, an inner and an outer hub, one mounted loosely around the other, the outer hub being provided with a channel in its peripheral surface and with a chamber in its inner surface, said outer hub having eccentric movement to and from the inner hub, means carried by the inner hub for preventing lateral movement of the outer hub, a circular pneumatic tube located within the chamber of the outer hub and having bearing relative to the inner hub, dust-guards, with or without corrugations, for both sides of both hubs, means for securing the said guards in position, spokes fitted at intervals at their inner ends in the peripheral channel of the outer hub, a felly connected with the spokes, a metal tire for the felly, series of chains attached to both hubs, the chains of both series being diagonally arranged but inclined in opposite directions, each series of chains being independent in action, one series being employed in an advance movement of the wheel and the other in a reverse movement, spacing-blocks wedged between the spokes into the peripheral channel of the outer hub, and locking devices for the spacing-blocks, all arranged for the purpose specified.



4. In vehicle-wheels, a primary and a secondary hub, a cushion between the two hubs, flexible elements connecting the hubs, the elements being in series and the elements of one series being inclined in an opposite direction to the elements of the other series, a flanged ring secured to the secondary hub, provided with an attached gearing and a dust-guard, and means for attaching the said dust guard to the flanged ring and to the primary hub.

5. In vehicle-wheels, a primary and a secondary hub, one mounted to revolve over the other, flexible elements connecting the said hubs, which elements are in two series, the elements of one series having an inclination the reverse of the inclination of the other series, a flanged ring secured to the inner peripheral portion of the secondary hub, a collar extending from said ring, teeth exteriorly produced on the collar, a dust-guard, a ring adapted to hold the dust-guard in connection with the said collar, and another ring arranged to hold the dust-guard in relation to the primary hub.

6. In vehicle-wheels, an inner or main hub having an integral disk-flange with a series of peripheral lugs projecting outward and also a removable disk-flange mounted on the hub, said disk having a series of peripheral lugs projecting outward in the same manner as those of the integral disk-flange of said hub, an outer or secondary hub provided with an inner annular chamber U-shaped in cross-section, and an exterior circular channel serving as a seat for the wheel-spokes, said secondary hub provided with a series of integral lugs projecting on each side, an intervening pneumatic cushion of U shape in cross-section, and flexible driving connections between the two hubs.

7. In vehicle-wheels, an inner or main hub and an outer or secondary hub, the latter with parallel sides in a straight line from the inner edge to the outer edge, and also with concave or round shoulders projecting outward from its side, said secondary hubs (denominated parallel sides and concave shoulders respectively) being provided with marginal ribs extending outwardly and said ribs provided with lugs extending inwardly, an intervening pneumatic cushion of U shape in cross-section, and flexible driving connections between the main and secondary hubs.

8. In vehicle-wheels, an inner or main hub and an outer or secondary hub, an intervening pneumatic cushion provided with an integral circular base at its inner portion, said base having a flat face, an endless band of marginal flanges adapted to be engaged by the said flat face of the said circular base, two series of chains located in opposite diagonal relation to each other and having direct communication with both hubs, each series acting in opposite directions so as to impart forward and backward movement respectively to the wheel.

9. In vehicle-wheels, an inner or main hub and an outer or secondary hub, a pneumatic cushion having at its inner portion an integral circular base, said cushion having direct bearing with relation to the secondary and the main hubs, the bearing with the latter being effected by an endless band intervening between the cushion and the main hub, chains arranged in two series, the chains of one series having an opposite diagonal direction to those of the other series, which chains extend directly to and from the main and secondary hubs respectively, each series acting in an opposite direction, one series being adapted for action to accomplish an advance movement of the wheel and the other series to accomplish a rearward movement.

10. In vehicle-wheels, an inner or main hub provided with a driving-gearing, an integral disk-flange with a series of lugs extending from said flange, a removable disk-flange having a series of lugs extending from said flange, a collar or endless metal band with marginal flanges carried by the main hub in connection with an elastic cushion of U shape in cross-section said collar being made to turn loosely on said hub, an outer or secondary hub loosely surrounding the main hub and having vertical movement to and from the same, a pneumatic cushion connected to the secondary hub, having direct action relative to the main hub, and flexible driving connections between the two hubs, which connections are in two series diagonally arranged but inclining in opposite directions, one series being adapted for action to accomplish an advance movement of the wheel and the other series to accomplish a rearward movement.

11. In vehicle-wheels, an inner and an outer hub, as described, one mounted loosely around the other, said outer hub being provided with gearing on the peripheral surface of the inner rib of the hub, a circular pneumatic tube of U shape in cross-section fitted in the interior chamber of the outer hub and having constant bearing upon the main hub by means of an endless band intervening between the pneumatic tube and the inner hub, a hollow bolt in connection with said pneumatic tube and the outer hub, and chains in direct connection with the two hubs, which chains are in independent series, acting in opposite directions.

12. In vehicle-wheels, two spaced hubs, as described, one surrounding the other and having movement to and from the other, an intervening circular pneumatic tube jacketed in the outer hub and having bearing upon the hub by means of an endless band in connection with the said pneumatic tube, and series of chains in direct connection with both hubs, the chains of both series being diagonally arranged but inclining in opposite directions, corresponding chains of the two series forming a triangle for the purpose described of allowing free eccentric play of the main hub to and from the other.

13. In vehicle-wheels, two spaced hubs, as described, one surrounding the other, the outer hub having a series of lugs on each side extending from said sides, an intervening circular pneumatic tube jacketed in the outer hub and having bearing upon the other hub, series of chains in direct connection with both hubs, the chains of both series being diagonally arranged but inclining in opposite directions, corresponding chains of the two series forming a triangle, a channel formed in the outer hub for the purpose described, spokes fitted in said channel, a felly receiving the spokes, and a hard tire for the felly.

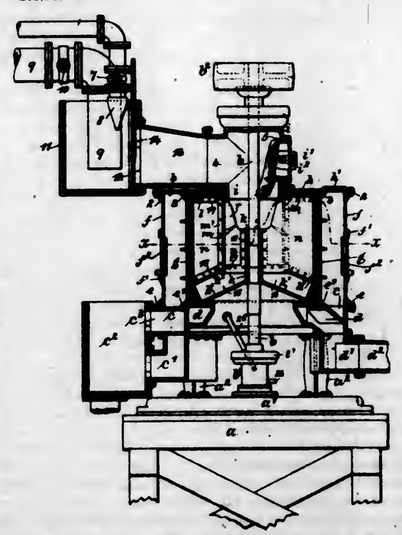
14. In vehicle-wheels, two spaced hubs as described, one surrounding the other and having movement to and from the other, an intermediate circular pneumatic tube jacketed in the outer hub and having bearing upon the main hub, means for supplying the said pneumatic tube with air, devices for preventing lateral movement of the surrounding hub, which devices are carried by the hub surrounded as described, series of chains in direct connection with both hubs, the chains of both series being diagonally arranged but inclined in opposite directions, corresponding chains for the two series forming corresponding triangles, dust-guards for the two hubs as described, means for securing the dust-guards in position, and a driving-gear carried by one of the hubs as set forth.

15. In vehicle-wheels, an inner and an outer hub as described, one mounted loosely around the other, the outer hub being provided with a channel in its peripheral surface and with a chamber in its inner surface, said outer hub having eccentric movement to and from the inner hub, means carried by the inner hub for preventing lateral movement of the outer hub, a circular pneumatic tube of U shape in cross-section located within the chamber of the outer hub and having direct bearing relative to the inner hub, dust-guards, with or without corrugations for both sides of the body of the hubs, means for securing the said guards in position, spokes fitted at intervals in the peripheral channel of the outer hub, a felly connected with the spokes, a metal tire for the felly, series of chains in direct connection with both hubs, the chains of both series being diagonally arranged but inclined in opposite directions, each series of chains being independent in action, one series being employed in an advance movement of the wheel and the other in the reverse movement, spacing-blocks wedged between the spokes into the peripheral channel of the outer hub, and locking devices for the spacing-blocks, all arranged for the purpose specified.

16. In vehicle-wheels, a primary and a secondary hub as described, a pneumatic cushion between the two hubs, flexible elements in direct connection with the hubs, as described, the elements being in two series and the elements of one series being inclined in an opposite direction to the elements of the other series, a flanged ring or disk secured to the secondary hub, provided with an attached gearing and a dust-guard, and means for attaching the dust-guard to the flanged ring and to the primary hub.

17. In vehicle-wheels, a primary and an auxiliary hub, said hubs being provided at one or both sides with direct driving-chain connections arranged in two series, both series being in diagonal relation to both hubs, but one series of chains being in an opposite direction to the other with relation to said hubs, a driving flanged ring secured to the auxiliary hub, a dust-guard in connection with the said ring and the primary hub, and rings adapted to hold the dust-guard in position.

809,041. CENTRIFUGAL PULP-SCREEN. JAMES H. BAKER, GEORGE F. SHEVLIN, and FREDERICK H. BAKER, Saratoga Springs, N. Y., assignors to Baker and Shevlin Company, Saratoga Springs, N. Y., a Corporation of New York. Filed Aug. 30, 1905. Serial No. 276,345.



Claim.—1. In a centrifugal pulp-screen, the combination with the beater-wheels, of devices secured behind the blades of the beater-wheels and within the cylindrical portion and near the upper ends of the blades to prevent the stock gathering behind the blades.

2. In a centrifugal pulp-screen, the combination with the blades and cylindrical portions of the beater-wheels, of devices placed behind the blades and within the cylindrical part and near the upper part of the blades and extending across and filling the spaces behind the blades and means for attaching the same in place so as to prevent the lodgment of stock behind the blades.

3. In a centrifugal pulp-screen, the combination with the series of curved blades and the cylindrical portion bisecting the same and forming the beater-wheels, of fillets comprising plates of metal with bent ends extending across behind the blades and in the angle formed by said blades and cylinder with the end fitting in against the backs

of the blades and surface of the cylinder, so as to prevent the stock gathering behind the blades.

4. In a centrifugal pulp-screen, the combination with the blades and cylindrical portion forming the beater-wheels and in which cylindrical portion are exit-slots for the stock at the edges of and parallel with the said blades, of means for lessening the size of said slots as desired.

5. In a centrifugal pulp-screen, the combination with the blades and cylindrical portion forming the beater-wheels and in which cylindrical portion are exit-slots for the stock at the edges of and parallel with said blades, of blades slotted transversely and screws for attaching the same to the surface of the cylinder providing for an adjustable relation of the blades to the cylinder for varying the size of the slots.

6. In a centrifugal pulp-screen the combination with the circular segmental screen-plates and the annular concentric cast-metal troughs, of the segmental casing of panels surrounding the screen-plates and provided with an opening of appreciable area, a frame surrounding said opening and forming a slideway and a shutter-plate within said frame and against the surface of said casing to close off the opening in the panel of the casing for providing access thereto by raising the shutter-plate

7. In a centrifugal pulp-screen, the combination with the circular segmental screen-plates and the annular concentric cast-metal troughs, of the segmental casing of panels surrounding the screen-plates and provided with an opening of appreciable area, of a device having a slidable relation with said panels and adapted to cover the opening therein and a support therefor.

8. In a centrifugal pulp-screen, the combination with the segmental casing and concentric circular segmental screen-plates within the same, of the annular concentric cast-metal troughs, the one coming between the aforesaid parts at the base thereof and the other within the screen-plates, a discharge-trough connected with the inner of said concentric troughs and located below the same on one side of the machine, a discharge-trough opening into the outer of said cast-metal troughs and located beneath the same, and an exit-opening formed in the latter trough parallel to the exit-opening of the latter discharge-trough as an exit-opening for air from between the casing and the screen-plates.

9. In a centrifugal pulp-screen, the combination with the segmental casing of panels and the circular segmental screen-plates connected therewith and within the same and the annular concentric cast-metal troughs, the one between and the other within the said parts, of means located at the upper portion of the casing and screen-plates, between the panels of the segmental casing and also at one side of the outer cast-metal trough as exits for the confined air between said casing and screen-plates in the operation of the machine.

10. In a centrifugal pulp-screen, the combination with the segmental casing *f* and circular screen-plates *g*, of the annular concentric cast-metal troughs *c d*, to which the aforesaid parts are connected, a curved discharge-trough *c'* below and opening into the trough *c* at one side of the machine and having an exit-opening therefrom and of the length of the said trough *c'* and a parallel opening c^2 at the side of the trough *c* as an exit for the air from between the casing and the screen-plates.

11. In a centrifugal pulp-screen, the combination with the segmental casing *f* and circular screen-plates *g*, of the annular concentric cast-metal troughs *c d*, to which the aforesaid parts are connected, a curved discharge-trough *c'* below and opening into the trough *c* at one side of the machine and having an exit-opening therefrom and of the length of the said trough *c'* and a parallel opening c^2 at the side of the trough *c* as an exit for the air from between the casing and the screen-plates, and a tank c^3 fitted up against the discharge-trough *c'* and the air-exit opening c^2 of the trough *c* to receive the good stock in the operation of the machine.

12. In a centrifugal pulp-screen, the combination with a vertical revolvable shaft and a step-bearing for the lower end of the shaft and means for oiling and cooling the shaft at its bearing, of a cover to the oiling and cooling device provided with a downwardly-extending outer flange f' and a second downwardly-extending inner flange f^2.

13. In a centrifugal pulp-screen, the combination with a vertical revolvable shaft and a step-bearing for the lower end of the shaft and means for oiling and cooling the shaft at its bearing, of a device surrounding the shaft and extending over the oiling and cooling device and having parts associated therewith and acting at the same time to prevent foreign particles getting into the oiling and cooling device or oil spattered by the revolving shaft from getting out.

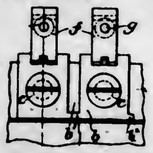
14. In a centrifugal pulp-screen, the combination with a vertical revolvable shaft and the beater-wheel, of an inlet-pipe for the stock to the beater-wheel, a vat and pipe connecting the same to said inlet-pipe, a pipe for introducing the stock into the vat, a pipe for water and a nozzle for admitting the water into the vat to mix with the stock and reduce its consistency, and a gate in the opening between said vat and pipe for regulating the extent of flow of the thinned stock to the machine.

15. In a centrifugal pulp-screen, the combination with a vertical revolvable shaft and the beater-wheel, of an inlet-pipe for the stock to the beater-wheel, a vat and pipe connecting the same to said inlet-pipe, a pipe for introducing the stock into the vat, a pipe for water and a nozzle for admitting the water into the vat to mix with the stock and reduce its consistency and a gate in the opening between said vat and pipe for regulating the extent of the flow of the thinned stock to the machine, the said nozzle being narrow in one direction and of at least the diameter of the pipe in the opposite direction and located above the lower end of the gate and the discharge-opening formed thereby and the lower end of the inlet-pipe for the stock below the normal position of the lower end of the gate and immersed, the gate controlling the depth of the discharge.

16. In a centrifugal pulp-screen, the combination with the segmental casing *f* and circular screen-plates *g* of the annular cast-metal trough *c* coming below and between the vertical planes thereof, a curved discharge-trough *c'* below the trough *c* and into which the trough *c* opens and an air-exit opening c^2 at the side of the trough *c* for the pent-up air from between the casing and screen-plates.

17. In a centrifugal pulp-screen, the combination with the segmental casing *f* and circular screen-plates *g* of the annular cast-metal trough *c* coming below and between the vertical planes thereof, and an air-exit opening c^2 at one side of the trough *c* and in the same horizontal plane for the pent-up air from between the casing and screen-plates.

809,042. **HAMMER-SUPPORTING FLANGE FOR PIANO-ACTIONS.** CHARLES P. BLINN, Boston, Mass., assignor to A. M. McPhail Piano Company, Boston, Mass., a Corporation of Massachusetts. Filed Sept. 25, 1905. Serial No. 279,282.



Claim.—1. A continuous flange for piano-actions, comprising a body portion having a series of lugs or hammer-supports, and a corresponding series of screw-holes, the body portion being weakened between the screw-holes.

3. A continuous flange for piano-actions, comprising a body portion and a series of lugs or hammer-supports, projecting from one edge of the body portion, the latter being provided with a series of screw-holes corresponding in number and position with the lugs, and with cuts or kerfs partially subdividing the body portion between the screw-holes.

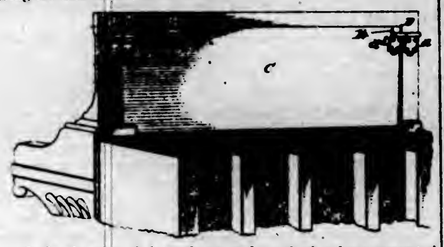
3. A flange for piano-actions having pivot-supporting lugs for the hammers projecting from one edge of the flange, the portions of the flange between said lugs being transversely weakened to permit the crosswise breakage of the flange between the lugs, whereby any lug-supporting portion of the flange may be broken out and removed without removal of the entire flange.

4. A flange for piano-actions having pivot-supporting lugs for the hammers projecting from one edge of the flange, the portions of the flange between said lugs having cuts extending from one edge of the flange partly across the flange, the inner ends of said cuts being separated from the opposite edge of the flange by narrow necks, which, while preserving the continuity of the flange, may be easily broken to permit the removal of any lug-supporting portion of the flange without removal of the entire flange.

809,048. **REGULATING-HINGE FOR PIANO SWINGING FRAMES.** ISRAEL H. ROSENFIELDER and ROBERT K. TROMLER, New York, N. Y. Filed May 26, 1904. Serial No. 209,662.

Claim.—1. A hinge comprising a vertical section curved outwardly at its upper portion to permit of the adjustment of the said curved portion when the hinge is in position, a second vertical section, and means for pivotally connecting the sections of the hinge together at their upper portions.

2. A hinge, comprising a flat section and an independent section outwardly curved at its upper portion to permit of the adjustment of the curved portion when the hinge is in position, both sections being provided with a sleeve at their upper edges, the sleeves abutting at one end when in position, and the other end of the sleeve of one section having a recess therein, and a pintle passed through the said sleeves and provided with a lateral extension at one end entering the said recess, as set forth.



3. In pianos, a skeleton frame and a swinging frame mounted in the skeleton frame, hinges each made in two sections, one section of a hinge being attached to the skeleton frame and the other section to the swinging frame, both sections being provided with sleeves at their upper ends, one of the sleeves having a recess therein, the sections of the hinges secured to the skeleton frame being outwardly curved at their upper portions, means for firmly securing the lower portions of the hinges to their supports, adjusting-screws passed through the upper curved portions of the sections secured to the skeleton frame, and pintles passed through the said sleeves, having projections entering the said recesses so that by tightening or loosening the screws on the curved sections of the hinges any wind in the swinging frame can be rectified, as described.

4. A hinge for piano swinging frames comprising two independent sections, one of which is arranged for attachment to the skeleton frame and the other section for attachment to the swinging frame, both sections being provided with sleeves and a pintle passed through the said sleeves, the section of hinge for attachment to the skeleton frame being outwardly curved at the portion adjacent to the sleeve and adjustable toward or from the frame when in position thereon, and means for adjusting the said curved portion, as set forth.

5. In pianos and the like, a skeleton frame, and a swinging frame mounted in the skeleton frame, hinges each comprising a section attached to the skeleton frame and having an outwardly-curved portion and a sleeve at the end of the curved portion, another hinge-section attached to the swinging frame and having a sleeve at one end adapted to register with the sleeve of the first-named section, and a pintle passed through the sleeves, and adjusting-screws at the said curved portion, for the purpose set forth.

809,044. **AUTOMATIC NUT-LOCK.** JAMES T. CLARK, Winnipeg, Canada, assignor of one-half to George Donald McKay, Winnipeg, Canada. Filed May 31, 1905. Serial No. 262,263.

Claim.—1. A nut-lock comprising a washer having a plurality of integral, pointed, radial fingers upwardly curved at their central portions and adapted, when flattened down, to extend into the central opening of the washer, and a plurality of integral, pointed, outer fingers upwardly curved at their centers and having their points lying flush with the surface of the washer.

2. A nut-lock comprising a washer of spring metal having a plurality of integral, pointed, radial fingers upwardly curved at their centers and bent upwardly from left to right at their pointed ends to engage the under side and prevent backward turning of the nut, and a plurality of outer fingers upwardly curved at their central portions and having their ends lying flush with the surface of the washer.

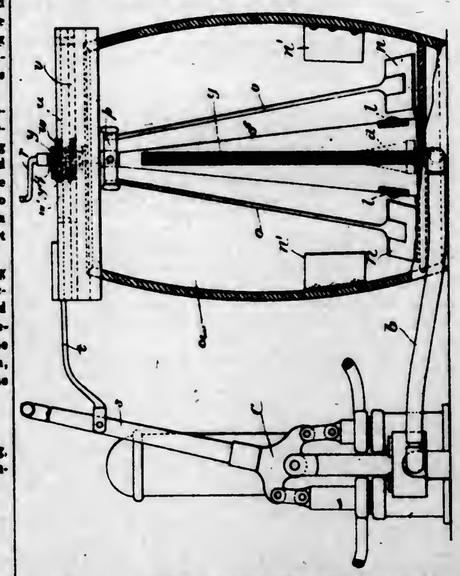
3. In a washer having a central opening, a plurality of radial fingers having upwardly-curved central portions and inclined pointed ends extending into the central opening of the washer, downwardly-extending points in the periphery of the central opening adjacent to the radial fingers, and a plurality of outer fingers upwardly curved at their central portions and having their ends lying flush with the surface of the washer.

4. A nut-lock comprising a washer having a central opening, a plurality of radial fingers having upwardly-bent central portions and inclined pointed ends adapted to engage the thread of a bolt, downwardly-bent points on the periphery of the central opening adapted to engage the material underneath the washer, and outer pointed fingers bent upwardly at their central portions and having their points flush with the surface of the washer.

5. A nut-lock comprising a washer having a plurality of radial fingers with upwardly-bent central portions and inclined pointed ends, a plurality of downwardly-turned points adjacent to said fingers and a series of outer pointed fingers upwardly bent at their central portions and adapted to lock a nut against return movement.

6. A nut-lock comprising a trefoil-washer having radial fingers with upwardly-bent central portions and inclined pointed ends adapted to engage the thread of a bolt, downwardly-turned points on the periphery of the central opening of the washer adapted to prevent the washer from turning with the nut, and outer fingers bent upwardly at their central portions and adapted to lock the nut against return movement.

809,045. **SPRAYING APPARATUS.** ABBOT M. COBB, Malden, Mass. Filed Dec. 8, 1904. Serial No. 236,947.



Claim.—1. A spraying apparatus comprising a receptacle having an outlet in its bottom, a conduit extending substantially the entire height of the receptacle attached to the bottom thereof with a liquid-tight connection and opening into said outlet, said conduit having provisions for admitting liquid to its interior simultaneously from the upper portion and a plurality of lower levels of the receptacle, and being separated on all sides from the walls of the receptacle by a space, and a stirring-blade located in such space and revolubly movable about the conduit.

2. A spraying apparatus comprising a receptacle having an outlet in its bottom, a conduit extending substantially the entire height of the receptacle attached to the bottom thereof with a liquid-tight connection and opening into said outlet, said conduit having provisions for admitting liquid to its interior simultaneously from the upper portion and a plurality of lower levels of the receptacle, and being separated on all sides from the walls of the receptacle by a space, a rotary cross-arm mounted above the conduit, a depending arm extending from said cross-arm downward into said space and movable around the conduit, and a stirring-blade secured to the depending arm adjacent the bottom of the receptacle and inclined with

respect to the vertical, whereby an upward movement is given to the liquid in the receptacle by movement of the blade.

3. A spraying apparatus comprising a receptacle having an outlet in its bottom, a conduit extending substantially the entire height of the receptacle attached to the bottom thereof with a liquid-tight connection and opening into said outlet, said conduit having provisions for admitting liquid to its interior simultaneously from the upper portion and a plurality of lower levels of the receptacle, and being separated on all sides from the walls of the receptacle by a space, a rotary cross-arm mounted above the conduit, a depending arm extending from said cross-arm downward into said space and movable around the conduit, a stirring-blade secured to the depending arm adjacent the bottom of the receptacle and inclined with respect to the vertical, whereby an upward movement is given to the liquid in the receptacle by movement of the blade, and stationary blades fixed to the walls of the receptacle arranged in vertical planes and projecting obliquely into said space.

4. A spraying apparatus comprising a receptacle having an outlet in its bottom, a conduit extending substantially the entire height of the receptacle attached to the bottom thereof with a liquid-tight connection and opening into said outlet, said conduit having provisions for admitting liquid to its interior simultaneously from the upper portion and a plurality of lower levels of the receptacle, and being separated on all sides from the walls of the receptacle by a space, a stirring-blade located in such space and revolubly movable about the conduit, a pump having a suction-pipe connected with said outlet, and connections between the pump and stirring-blade and operated by the former for revolving the latter about the conduit.

5. A spraying apparatus comprising a receptacle, an outlet-pipe communicating with the lower portion of the receptacle, a tubular member tightly secured to the bottom of the receptacle surrounding the opening of the outlet-pipe extending upwardly therefrom and forming in its interior a chamber separated from the main body of the receptacle, the tubular member being provided with orifices at different distances from the bottom of the receptacle, a strainer within the space inclosed by said tubular member connected to the outlet-pipe and surrounding the opening thereof, and means for imparting an upward movement to the liquid contained in the receptacle surrounding the tubular member.

6. In a spraying apparatus, a receptacle, a partition forming an inclosed space within the receptacle extending from the lower toward the upper portion of the receptacle and separated on all sides from the walls thereof, the said partition being tightly mounted to prevent the inflow of liquid to its interior beneath its lower edge and having openings in its sides arranged at different heights from its bottom, provisions for preventing the flow of liquid through certain of the lower openings until the level of the liquid has fallen below a predetermined point, an outlet-conduit opening into the lower portion of the space inclosed by the partition, and a member arranged in the space between the partition and the walls of the receptacle for agitating the liquid contained in said space.

7. In a spraying apparatus, a receptacle, a partition forming an inclosed space within the receptacle extending from the lower toward the upper portion of the receptacle and separated on all sides from the walls thereof, the said partition being tightly mounted to prevent the inflow of liquid to its interior beneath its lower edge and having openings in its sides arranged at different heights from its bottom, means adapted to close certain of the lowermost openings when the receptacle is full of liquid, and arranged to uncover the same after the level of liquid has fallen to a predetermined point, an outlet-conduit opening into the lower portion of the space inclosed by the partition, and a member arranged in the space between the partition and the walls of the receptacle for agitating the liquid contained in said space.

8. In a spraying apparatus, a receptacle, a partition forming an inclosed space within the receptacle extending from the lower toward the upper portion of the receptacle and separated on all sides from the walls thereof, the said partition being tightly mounted to prevent the inflow of liquid to its interior beneath its lower edge and having openings in its sides arranged at different heights from its bottom, valves arranged in line with certain of the lower openings on the inside of the partition and yieldingly impelled to close said openings, an outlet-conduit opening into the lower portion of the space inclosed by the partition, and a member arranged in the space between the partition and the walls of the receptacle for agitating the liquid contained in said space.

9. In a spraying apparatus, a receptacle, a conduit mounted within the receptacle to extend from the upper to the lower portion thereof, having openings in its sides and mounted with a liquid-tight connection at its lower end, and gravity-operated means for closing certain of said orifices.

10. In a spraying apparatus, a receptacle, a conduit mounted within the receptacle to extend from the upper to the lower portion thereof, having openings in its sides and mounted with a liquid-tight connection at its lower end, a guide connected to the interior of the conduit adjacent one of said orifices and inclined relatively thereto, and a ball supported by said guide.

11. A spraying apparatus comprising a receptacle adapted to contain a solution, a pump, a pipe connected to the pump and leading into the lower part of the receptacle, headed studs mounted on the bottom of the receptacle, a tubular member within the receptacle surrounding the opening of the suction-pipe and extending toward the upper portion of the receptacle, forming an inner chamber separated on all sides from the side walls of the receptacle, the said member being formed with perforations arranged at varying distances from the bottom of the receptacle and connected to the bottom of the receptacle by integral hooks engaging said studs for excluding from the inner chamber all the solution except that which flows through the perforations, and stirring members consisting of blades inclined to the vertical beside the tubular member supported in the lower portion of the space between said member and the side walls of the receptacle and movable in a direction to impart an upward movement to the liquid contained in said space.

12. A spraying apparatus comprising a receptacle, a vertical conduit therein having a series of orifices at different distances from the bottom of the receptacle, said conduit being separated from the inner surface of the receptacle by a space surrounding the conduit, a pump having a suction-pipe communicating with the lower portion of the conduit, means located in the space surrounding the conduit for imparting an upward movement to the liquid contained therein and movable about the conduit, and fixed blades projecting inwardly from the outer wall of said space above the said means, arranged to arrest rotary movement of the liquid.

13. In a spraying apparatus, a receptacle, a tubular member open at its lower end located within the receptacle, extending from the bottom to a point near the top thereof, and separated on all sides from the sides of the receptacle, headed studs mounted on the bottom of the receptacle, and a lateral flange having hooks on the lower portion of the tubular member arranged to be engaged with said studs by rotation of said tubular member and to hold the lower end in liquid-excluding connection with the bottom of the receptacle, the tubular member having perforations in its sides.

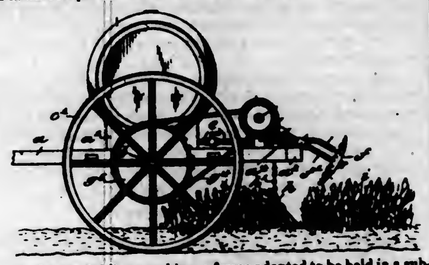
14. A spraying apparatus comprising a receptacle, a vertical conduit centrally located therein and having lateral orifices therein, an outlet-pipe extending into the receptacle and the interior of said conduit, a rotary arm mounted in the receptacle above the conduit, and stirring members depending from said arm and movable therewith in the space surrounding the conduit, said stirring members including flat blades inclined forwardly and downwardly with respect to the direction of rotation thereof and adapted to impart an upward movement to the liquid in the receptacle.

15. A spraying apparatus comprising a receptacle, a vertical conduit centrally located therein and having lateral orifices therein, an outlet-pipe extending into the receptacle and the interior of said conduit, a laterally-extending bar mounted in the receptacle above the conduit, means for rotating the bar, arms depending from the ends of said bar into the space surrounding the conduit, and inclined stirring-blades connected to the arms and rotarily movable with said bar.

16. A spraying apparatus comprising a receptacle adapted to contain a solution, a pump having a vibratory handle, a suction-pipe connecting the pump with an outlet in the receptacle, a rotary stirrer located in the receptacle having inclined blades for giving an upward movement to the solution, a vertical spindle connected to said stirrer for rotating the same, two pinions loosely surrounding at different levels said spindle, a horizontal guideway mounted on the top of the receptacle, a frame held, and movable longitudinally, in said guideway consisting of a pair of rack-bars arranged at different levels, one being in mesh with each of said pinions, a ratchet fixed to the spindle adjacent each pinion, pawls carried by the pinions for intermittently engaging the ratchets, and a link connecting said rack-frame with the pump-handle; the racks, pinions and ratchet being so arranged that opposite reciprocations of the frame cause first one and then the other ratchet to be engaged by its respective pawl, whereby the spindle is rotated always in the same direction.

809,046. SPRINKLING-MACHINE. WALTER A. COLLINS, Penns Manor, Pa. Filed May 12, 1905. Serial No. 260,215.

Claim.—1. In a sprinkling-machine, a frame adapted to be held in a substantially horizontal position, a disk-shape concaved sprayer carried by said frame and adapted to be held by the same in an oblique position, and said sprayer adapted when rotated to throw a fluid conducted to the same radially backward toward said frame and in an oblique direction with respect thereto.



2. In a sprinkling-machine, a frame adapted to be held in a substantially horizontal position, concaved sprayers arranged at the rear end of said frame and adapted to be held by the same in an oblique position with respect thereto, means suspended from said frame and held by the same a certain distance in front and parallel to said sprayers and the rear end of said frame, said means adapted to engage and to raise and to bend over vines when brought into engagement therewith to permit liquid conducted to said sprayers to be spread by the same backward toward said vine-actuating means and in an oblique direction thereto and over and about the leaves of said vines and to prevent deflection of said fluid by gravity.

3. In a sprinkling-machine, a frame adapted to be held in a substantially horizontal position, concaved sprayers arranged at the rear end of said frame and adapted to be held by the same in an oblique position with respect to said frame, means yielding in vertical and horizontal planes suspended from said frame and held by the same a certain distance in front and parallel to said sprayers and to the rear end of said frame, said means adapted to be brought into and out of engagement with vines, and said concaved sprayers adapted when the vines are raised and bent over by said means to spray a fluid radially toward and about the under and upper sides or surface of the leaves of said vines and to prevent deflection of certain portions of said fluid by gravity.

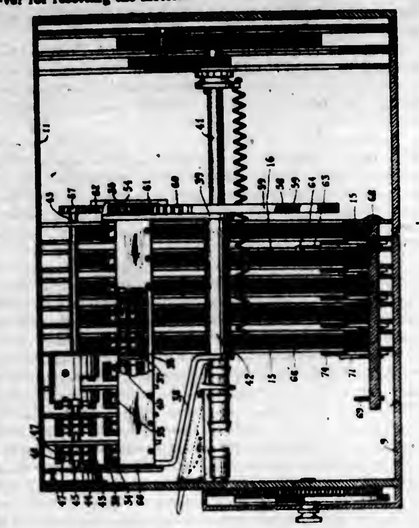
4. In a sprinkling-machine, a sprayer consisting of a concaved disk having a central smooth portion and a corrugated portion forming projections and depressions radially extending from the smooth portion surrounding the same and terminating about the perimeter of said disk, said smooth portion, when said disk is rotated, adapted to permit of the spreading of a fluid over the same and the projections of said corrugated portion in conjunction with said smooth portion adapted to throw or cast the fluid radially from said disk and to deflect the same backward and means for positively rotating said disk.

5. In a sprinkling-machine, a frame adapted to be held in a substantially horizontal position, concaved sprayers having central smooth and corrugated outer portions forming projections and depressions arranged at the rear end of said frame and adapted to be held in an oblique position in respect thereto, a bar yielding in vertical and horizontal planes arranged below said frame a certain distance in front and parallel to said sprayers and adapted to be brought into and out of engagement with vines, said sprayers adapted to radiate fluid in an oblique direction and to throw the same slightly forward by passing over the concaved surface thereof to reach the under side or surface of the leaves of said vines and to counteract deflection of a certain portion of the fluid-spray by gravity.

6. In a sprinkling-machine, a frame adapted to be held in a substantially horizontal position, a sprayer carried by said frame and adapted to be held by the same in a substantially oblique position with respect thereto, a bar consisting of rigid and yielding members, flexible means adapted to adjustably connect said bar with said frame so as to be held by the same a certain distance in front of said sprayer, said bar adapted to raise and bend over vines when brought into engagement therewith so as to expose the under side or surfaces of the leaves thereof, and said sprayer adapted when rotated to throw a fluid over the leaves of said vines.

809,047. CALCULATING-MACHINE. HENRY S. HOUGH, Cambridgeport, Mass., assignor to Hough Manufacturing Company, Boston, Mass., a Corporation of Massachusetts. Filed Apr. 26, 1905. Serial No. 257,516.

Claim.—1. In a calculating-machine, a horizontally-slidable epicycle cylindrical meter, means for operating the meter, and a lever for resetting the meter.



2. In a calculating-machine, a cylindrical epicycle meter movable horizontally and a lever for throwing the meter horizontally backward to its normal position.

3. In a calculating-machine, a meter, rotating means for the wheels of the meter, a driving-shaft without the meter for swinging the meter in a circle around the driving-shaft and against the rotating means, means for moving the meter horizontally and a lever for sending back the meter to initial position.

4. In a calculating-machine, a shaft, a cylindrical meter outside of and swinging upon the shaft, actuating means for rotating parts of the meter as the meter swings around the shaft, a frame inclosing the meter and shaft, and a lever having its handle extending without the frame for rotating all the parts of the meter to initial position.

5. In a calculating-machine, a meter, means for operating the meter, an indicator operable by the meter, and means for simultaneously resetting both the meter and indicator.

6. In a calculating-machine, a shaft, an arm journaled upon and extending outward from the shaft, a cylindrical meter outside of the shaft and journaled on the arm, actuating means for rotating the wheels of the meter when the same is swung in a circle around the shaft, means for moving the arm and meter along the shaft, a cylindrical indicator having its wheels rotated by the arm, and a lever for resetting the meter and indicator in their normal positions.

7. In a calculating-machine, an indicator having a series of teeth upon its periphery and partly projecting horizontal beyond one of its sides, a shaft below the indicator, an arm journaled on the shaft having a tooth projecting from its side and in contact with a tooth of the indicator-wheel on each revolution of the shaft.

8. In a calculating-machine, a shaft, an arm extending from and journaled upon the shaft and having a tooth extending outward at right angles to the arm, a meter journaled on the arm, an indicator above the meter having a series of teeth projecting beyond the wheel of the indicator and so arranged that on each revolution of the arm and meter around the shaft that the tooth on the arm will come in contact with one of the projecting teeth of the indicator and partly move the indicator.

9. In a calculating-machine, an indicator having a series of teeth extending outward beyond its side, a shaft, an arm extending outward from the shaft and provided with two teeth arranged to come in contact with two of the indicator-teeth on each revolution of the shaft, one tooth adapted to move the indicator a certain distance and the other tooth adapted to act as a stop for the indicator.

10. A calculating-meter, a series of segments having inwardly-projecting teeth arranged to be projected as desired, means for revolving the wheels of the meter against the inwardly-projected teeth, and inflexible means for stopping the revolving of the wheels.

11. In a calculating-machine, a shaft, a cylindrical meter outside of and swinging upon the shaft, actuating means for rotating parts of the meter as the meter swings around the shaft, and independent unyieldingly-stopping means for each of the rotating parts of the meter.

12. A revolving meter having a series of independently-revolving indicator-wheels in combination with a series of disks for separately turning the indicator-wheels and a series of stationary rigid fingers for separately stopping the indicator-wheels as the meter is revolved around the inner edge of the disks.

13. In a calculating-machine an epicycle meter, a series of toothed segments having outwardly-extending pins, a series of finger-levers for operating the segments having slots within which extend the pins and the segments adapted to be thrown by the finger-levers into operable contact with the meter as the meter is revolved around the inner circumference of the segments whereby the meter will be actuated.

14. In a calculating-machine, a series of toothed disks, levers for operating the disks, a cylindrical meter adapted to be driven around the inner side of the disks and in contact with the teeth of the operated disks, and means independent of the levers for holding the operated disks in operable contact with the revolving meter.

15. In a calculating-machine, several series of toothed disks, levers for operating the disks, a cylindrical meter adapted to be driven around the inner side of the disks and in contact with the teeth of the operated disks, locking means for each series independent of the levers for holding all the operated disks in meshing contact with the revolving meter and a lever for simultaneously throwing the locking means out of contact with all of the operated disks allowing them to return to initial positions.

16. In a calculating-machine, a series of segments, each segment provided with an ear, a pin attached to each ear, a lever for each segment having a slot within which extends one of the pins, and a cylindrical meter revolving within and operated by the segments.

17. In combination with the frame of a calculating-machine of a series of disks within the frame provided with ears, pins projecting from the ears, finger-keys extending without the frame and arranged to actuate the pins for inwardly projecting a portion of the disks, a driving-shaft, a meter without the shaft, means connecting the meter and shaft, means for operating the driving-shaft and rotating the meter, and means for resetting the disks and finger-keys.

18. In a calculating-machine, a series of finger-keys of different denominational value provided with slots in their shanks, a series of toothed segments provided with ears, each segment having a different number of teeth than the other segments in its series, a pin projecting from each ear and extending into the slot of itscorresponding finger-key, each pin traveling in a different direction from the other pins, each shank so varied in shape from the other shanks in its series that the travel of each pin is the least possible under the conditions so that each pin is equidistant from the fulcrum-point of its corresponding shank in each of the extreme positions which its segment will allow the pin to take, and a meter adapted to be actuated by the segments, substantially as shown.

19. In a calculating-machine having several series of toothed disks, of side walls inclosing each series, a meter having an indicator-wheel for each series of disks, a driving-shaft for revolving the meter and its shaft around the inner edges of the disks, a lever connected with each disk whereby the teeth of that disk may be projected inwardly in meshing contact with one of the wheels as the meter is revolved, a finger-plate for each indicator-wheel attached to one of the side walls extending inward toward the driving-shaft and having its finger adapted to stop the revolving of its corresponding indicator-wheel.

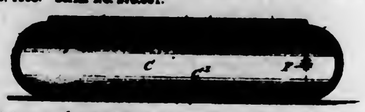
20. In a calculating-machine a recording-meter having a series of indicator-wheels, each wheel provided with two sets of numbers, segments surrounding the meter means for swinging the meter in contact with a portion of the segments, a second meter at one end of the segments and operated by the recording-meter on each revolution of the recording-meter, the recording-meter adapted to give the final sum in addition, the product in multiplication, and the minuend and sum in subtraction, and the second meter adapted to show the multiplier in multiplication and the result in division, substantially as described.

21. In a calculating-machine, several series of segments provided with inward-extending teeth and notches in their outer periphery, a spring-latch for each series adapted to engage a notch in each of the segments of that series, a revolving recording-meter having teeth in meshing contact with the teeth of the operated segments, a lever for disengaging the latches, and means connecting the lever and latches, substantially as shown.

22. In a calculating-machine, a series of segments, means for operating the segments, a driving-shaft within the segments, a hub carried by and horizontally slidable upon the shaft, arms extending outward from the hub and carrying a shaft, a cylindrical meter upon the shaft and revolved by the driving-shaft against the operated segments, a pinion upon the meter-shaft, a disk upon the driving-shaft, a hub encircling the disk having a series of teeth to be thrown as desired into meshing contact with the pinion whereby the meter may be set in initial position.

23. In a calculating-machine, a series of segments, a driving-shaft, a shaft, a cylindrical revolving meter upon the shaft arranged to be projected by the driving-shaft against a portion of the segments, a pinion upon the meter-shaft, an indicator above the meter, a pinion upon the indicator-shaft, a lever turning about the driving-shaft having two sets of teeth for operating the pinions and resetting the meter and indicator to their normal positions.

809,048. **VEHICLE.** JOHN J. FURCHTBAR, Joetta, Ill. Filed Aug. 26, 1905. Serial No. 275,881.



Claim.—1. A vehicle provided with a yieldingly-sustained immovable endless band, and a traveling endless band superimposed on the said immovable endless band and adapted to travel thereon.

2. A vehicle provided with an immovable endless band, a traveling endless band superimposed on the said fixed endless band and adapted to travel on the same, and an air-cushion for sustaining the said immovable band.

3. A vehicle comprising a supporting-frame, an air-cushion for sustaining the said frame, an endless band fixed to the frame, and a traveling band superimposed on the said fixed band and adapted to travel on the same.

4. A vehicle provided with an immovable endless band, a traveling endless band superimposed on the said fixed endless band and adapted to travel on the same, an air-cushion for sustaining the said immovable band, and means for delivering a strata of air between the said bands from the said air-cushion.

5. A vehicle provided with a pneumatically-sustained immovable endless band, and a traveling endless band superimposed on the said immovable endless band and adapted to travel thereon.

6. A vehicle comprising a supporting-frame, an air-cushion for sustaining the said frame, an endless band fixed to the frame, and a traveling band superimposed on the said fixed band and adapted to travel on the same, the said air-cushion and fixed band having registering openings for permitting air to pass from the said air-cushion between the said bands.

7. A vehicle comprising a supporting-frame, an air-cushion for sustaining the said frame, an endless band fixed to the frame, a traveling band superimposed on the said fixed band and adapted to travel on the same, and a lubricating-pad between the said bands at the top thereof.

809,049. **MATTRESS-HOLDER FOR FOLDING BEDS.** VERNOR J. GILLETT, Detroit, Mich. Filed Nov. 7, 1904. Serial No. 231,690.

Claim.—1. In a bedclothes-clamp, the combination of a resilient member adapted to engage the top, edge, and bottom of a mattress, with a bar parallel to said edge and connected with said resilient member, said bar being adapted to be secured to the supporting-frame, substantially as described.

2. A bedclothes-clamp, comprising a unitary resilient member adapted to engage the top, edge, and bottom of a mattress, and a member united thereto at one end, said member lying parallel with the edge of the mattress and being adapted to be secured to the supporting-frame, substantially as described.

3. In a bedclothes-clamp, the combination of end members each adapted to engage the top, edge, and bottom of a mattress with an intermediate member having spring connection with each of said end members, and capable of being attached to a mattress-supporting frame, substantially as described.

4. In a bedclothes-clamp, the combination of a member designed to be attached to a mattress-supporting frame with end members secured to each end thereof by spring means, each adapted to engage the top, edge and bottom of a mattress, substantially as described.

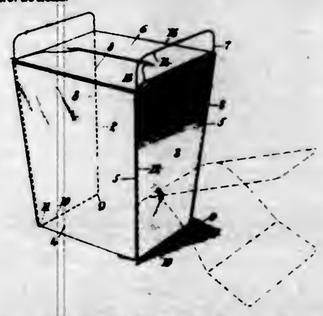
5. A bedclothes-clamp consisting of a unitary resilient member with a plurality of arms each adapted to engage the top, edge, and bottom of a mattress, said clamp being designed to be attached to the mattress-supporting frame, substantially as described.

6. In a bedclothes-clamp, a wire bent at its center to form a half-loop, each end of said half-loop terminating in a spiral spring, from which the wire is extended to form a rectangle, one of whose sides is open, two of the three sides being approximately parallel to the corresponding arm of the central loop and its open side facing in the same direction as the open side of the loop, and terminating in a circular loop whose plane is at an angle to that of the rectangle at one of whose corners it is situated, substantially as described.

7. In a bedclothes-clamp, a wire bent at its center into a U shape, each arm of which is at its upper terminal bent to form a spiral spring, hence continuing to form a rectangle two of whose sides are approximately parallel to its corresponding arm of the U, and whose fourth side is open and faces in the same direction as the open part of the U, terminating in a small loop whose plane is at an angle to that of the rectangle, at one of whose corners it is situated, substantially as described.

8. In a bedclothes-clamp, a wire bent at its center to form a half-loop, extending symmetrically on each side therefrom, being bent at each end of said half-loop into a spiral spring, continuing thence to form three sides of a rectangle, the open side facing in the same direction as the open end of said central loop, two of the sides thus formed by the wire being approximately parallel to the corresponding arm of the central loop, each end of said wire terminating in a small loop whose plane is at an angle to that determined by the three sides of the rectangle to one of whose corners it is attached, substantially as described.

809,050. **BOX-OPENER.** CARL GOLDMANN, New York, N. Y., assignor of one-half to Ernest Kohr, New York, N. Y. Filed June 6, 1905. Serial No. 264,082.

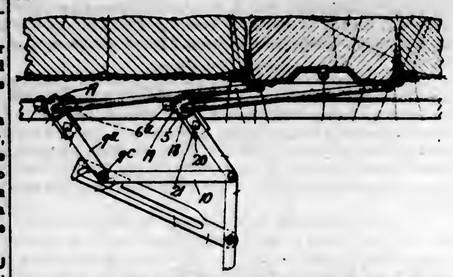


Claim.—1. A rectangular box provided in each pair of opposite corners thereof with a wire extending along the corners of each pair, thence through and across the under side of the bottom of the box, the extremities of each of said wires being united above the top of the box to form a bail for the box.

2. A rectangular box provided in each pair of opposite corners thereof with a wire extending along the corners of each pair, thence through and across the under side of the bottom of the box, the extremities of each of said wires being united above the top of the box to form a bail for the box, and each corner of the box being provided interiorly with a shield for the corresponding inner portion of the wire, to prevent contamination of the contents of the box.

809,051. **INVALID-BED.** LYDIA A. GOODSON, Elgin, and WILLIAM A. MASON, Algonquin, Ill. Filed May 22, 1905. Serial No. 261,547.

Claim.—1. In an invalid-bed, in combination with the mattress and the support for the same having registering apertures; a pin adapted to be entered through the aperture in the support and occupy the aperture in the mattress; a plate on which each support is mounted; parallel crank rock-shafts mounted on the bed-frame having their crank-wrists connected by the plate and having parallel lever-arms and a link connecting them, the ratchet-bar, 11, connected to one of the lever-arms and a stud for engagement with the ratchet-bar.



2. In an invalid-bed, in combination with the bed-frame, a mattress and mattress-support thereon; parallel cranked rock-shafts mounted on the bed-frame; a link plate connecting their crank-wrists, said rock-shaft having parallel lever-arms and a link connecting them, one of the arms being extended past the pivot of the link; a ratchet-bar pivotally connected with said extended lever-arm, and a stud for engagement with the ratchet-bar carried by the other lever-arm.

3. In an invalid-bed, in combination with the bed-frame, two parallel crank-shafts mounted thereon having their cranks extending downwardly; a link plate connecting their crank-wrists, said rock-shafts having each a lever-arm at both ends; links connecting the two arms at each end, one of the lever-arms at one end being extended beyond the link-pivot; a ratchet-bar connected to said extended arm, and a stud for engagement of the ratchet-bar carried by the corresponding arm of the other rock-shaft.

4. In an invalid-bed, in combination with the bed-frame, two parallel crank-shafts journaled in the side bars of the frame and cranked between the bars; a link plate connecting their crank-wrists, said rock-shafts having each a rigid lever-arm other than the crank-arms and extending at a considerable angle to said crank-arms; a link connecting said lever-arms, one of the lever-arms being extended beyond the pivot of the link; a bar having pivotal connection to one of the arms and sliding connection with the other arm at different distances from the crank-shafts, and means for releasably securing said bar at said sliding connection.

5. In an invalid-bed, in combination with a bed-frame, parallel shafts mounted in the side bars thereof and cranked downwardly between the side bars; a link plate connecting their crank-wrist; said rock-shafts having parallel lever-arms extending at an angle to their crank-arms respectively; a link connecting said lever-arms at equal distances from their respective crank-shafts, and a second link having a pivotal connection with one of the arms and a sliding connection with the other at different distances from the crank-shaft, and means for releasably engaging said second link at its said sliding connection.

6. In an invalid-bed, in combination with the bed-frame, parallel rock-shafts journaled on the side bars and cranked downwardly between said bars; a link plate connecting the crank-wrists, said shafts having parallel lever-arms extending at an angle to the crank-arms respectively; a link connecting said parallel arms at equal distances from their respective rock-shafts; a second link connecting one of the lever-arms with the first link, one of said connections being a sliding connection, and means for releasably engaging it at said sliding connection.

7. In an invalid-bed, in combination with the bed-frame, two parallel rock-shafts mounted on the side bars thereof; a link plate connecting the crank-wrists, each rock-shaft having a lever-arm extending at an angle to the crank-arm; a link connecting the two lever-arms at equal distances from the crank-shafts, one of the lever-arms being extended below the link connection, and a second link pivoted to said extended lever-arm and notched for engagement with the pivot of the link to the other arm.

8. In an invalid-bed, in combination with the bed-frame, two parallel rock-shafts mounted on the side bars thereof; a link plate connecting the crank-wrists, each rock-shaft having a lever-arm extending at an angle to the crank-arm; a link connecting the two lever-arms at equal distances from the crank-shafts, one of the lever-arms being extended below the link connection, and a second link pivoted to said extended lever-arm below the pivot of the first link and slotted and notched for engagement with the pivot of said first link to the other lever-arm.

9. In an invalid-bed in combination with a mattress-plug or bed-pan and apparatus for raising and lowering the same, comprising a plate for supporting the plug or bed-pan having an upwardly-struck boss forming a cavity in the lower side of the plate, the bottom of the plug or bed-pan having a recess to receive such protruding element.

10. In an invalid-bed, a bed-pan and an apparatus for raising and lowering the same comprising a plate for supporting the bed-pan which has an upwardly-struck and downwardly-open boss, in combination with a bed-pan having a corresponding recess struck upwardly from the bottom adapted to receive the boss, and means protruding into the cavity of the downwardly-open boss for securing the plate and pan together at the said corresponding boss and recess.

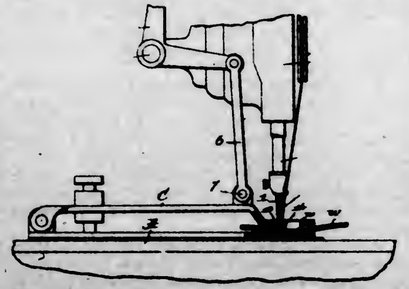
11. An invalid-bed having an apparatus for raising and lowering a mattress-plug or bed-pan, said apparatus comprising a plate for supporting the plug or bed-pan, in combination with such plug or pan adapted to be lodged on the plate, the plate having a boss struck from it protruding upwardly, the bottom of the pan or plug having a corresponding recess struck upwardly from the bottom adapted to receive the boss of the plate.

12. An invalid-bed having an apparatus for raising and lowering a mattress-plug or bed-pan, said apparatus comprising a plate for supporting the plug or bed-pan, in combination with such plug or bed-pan adapted to be lodged on the plate, the plate having a boss struck from it, protruding upwardly, and downwardly hollow, the bottom of the plug or bed-pan having a corresponding recess struck upwardly to receive the boss, the boss having an oblong slot, and a turn-button projecting from the bottom of the recess through such slot adapted to be turned across the same.

13. In an invalid-bed, in combination with a woven-wire-mattress support, a mattress mounted thereupon, the support and the mattress having registering apertures for a plug or bed-pan; corner posts or guides at the corners of the apertures in the mattress-support in position to enter the corners of the aperture in the mattress, said posts being bound rigidly to the woven-wire-mattress support.

14. In an invalid-bed, in combination with a woven-wire-mattress support, a mattress thereon, said support and mattress having registering apertures for a plug or bed-pan; corner posts or guides at the corners of the aperture in the mattress-support for engaging the corners of the aperture in the mattress, said corner-posts being made of a rod or wire folded upon itself and having the two branches bent at right angles to the folded portion and at an angle to each other; and a corner-plate lodged on one surface of the woven-wire mattress and secured thereto and to the terminal feet of the bent-wire post.

809,052. BUTTONHOLE-STITCHING MACHINE. WILLIAM B. GOODYEAR, Boston, Mass. Filed Nov. 4, 1904. Serial No. 231,347.



Claim.—1. In a sewing-machine having an eye-pointed needle, complemental stitch-forming means, a take-up and a work-holder, a purl-controller, and means for actuating the same to engage the needle-thread between the point of the needle and the work, and move the same to either side of the needle to thereby deflect the bights of under thread to the edge of the buttonhole thereby leaving the purl at the edge.

2. In a sewing-machine having an eye-pointed needle, complemental stitch-forming means, a take-up, a work-holder, a purl-controller having two prongs with a space between through which the needle passes in making each stitch, said prongs acting on the needle-thread to draw the bights of the under thread to the edge of the buttonhole thereby leaving the purl at the edge.

3. In a sewing-machine having an eye-pointed needle, complemental stitch-forming means, a take-up, a work-holder, a pivotally-mounted purl-controller or deflector in addition to the take-up, the acting portion of such controller or deflector occupying a position near the surface of the work, and means to move the same at an angle to the length of the buttonhole to engage the needle-thread between the needle and work and deflect the bight of the under thread to the edge of the buttonhole leaving the purl at the edge.

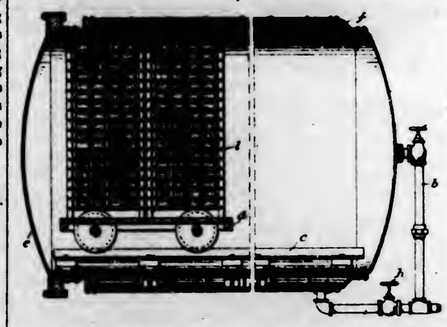
4. In a sewing-machine having an eye-pointed needle, complemental stitch-forming means, a take-up, a work-holder, a purl-controller, means to move the same at right angles to the length of the buttonhole, and means to raise said controller away from the work to remove or replace the work.

5. In a sewing-machine having an eye-pointed needle, complemental stitch-forming means, a take-up, a work-holder, a purl-controller, means to move the same at right angles to the length of the buttonhole, and means to adjust the throw of said controller to the width of the overedge stitches.

6. In a sewing-machine having an eye-pointed needle, complemental stitch-forming means, a take-up, a work-holder, a purl-controller in addition to the take-up and having a prong or projection, means for moving said controller to act upon the needle-thread between the point of the needle and the work as described, and means to vary automatically the position of the controller with relation to one or the other side of the buttonhole-slit being overstitched to deflect the bight of the under thread to the edge of the buttonhole.

7. In a sewing-machine, having an eye-pointed needle, complemental stitch-forming means, a take-up, a work-holder, a purl-controller having needle-thread-engaging means, by the side of which the needle passes in making each stitch, and means to move said purl-controller to one or the other side of the needle that it may act on the needle-thread to draw the bight of the under thread to either edge of the buttonhole, thereby leaving the purl at the edge.

809,053. MANUFACTURE OF SAND-LIME BRICKS. ALEXANDER GORDON, Weiser, Idaho. Filed May 4, 1905. Serial No. 259,806.



Claim.—1. A process of making sand-lime bricks, which comprises molding by the wet process, subjecting the bricks thus produced to a dry heat in a closed receptacle, and then subjecting them to a moist heat.

2. The process of making sand-lime brick, which comprises molding by the wet process, subjecting the bricks to a dry heat produced by steam, and then subjecting them to the direct action of steam.

3. A process of manufacturing sand-lime bricks, which consists in molding them in a moist state, transferring them from a molding-machine to pallets, introducing the bricks on the pallets into a heated dry atmosphere excluding external air from the bricks, and finally subjecting the bricks to a moist heat.

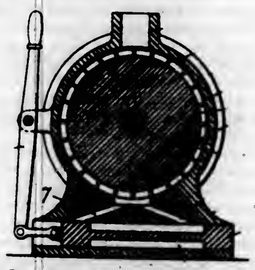
4. A process of making sand-lime bricks which comprises molding by the wet process, subjecting the bricks thus produced to a dry heat produced by steam, the bricks being in a closed receptacle, to preliminarily harden them and then completing the hardening operation by subjecting the bricks to the direct action of a heating medium composed of steam.

5. A process of making sand-lime bricks which comprises molding in a moist state, subjecting the bricks to a dry heat at ordinary pressures in a closed receptacle thereby evaporating water held in the bricks after molding, preliminarily hardening the bricks in their own steam thus generated and continuing the hardening operation by subjecting the bricks to a moist heat.

6. An apparatus for hardening sand-lime bricks, comprising a receptacle having a steam-jacket and provided with a track upon the inside thereof, a pipe for introducing steam into the jacket, a pipe for introducing steam in the interior of the receptacle, valves for both of said pipes, and means for connecting said pipes with the main supply-pipe, whereby the steam may be introduced into the jacket or receptacle at will.

7. An apparatus for hardening sand-lime bricks, comprising a receptacle having a steam-jacket and provided with a track upon the inside thereof, a pipe for introducing steam into the jacket, a pipe for introducing steam in the interior of the receptacle, valves for both of said pipes, and means for connecting said pipes with the main supply-pipe, in combination with a truck for running on said track, said truck being provided with pallets for supporting sand-lime bricks in a soft state.

809,054. ROTARY ENGINE. ANDREW HAGEN, San Francisco, Cal. Filed Sept. 21, 1905. Serial No. 279,594.



Claim.—1. In a rotary engine, the combination of a cylindrical casing, a cylinder rotating therein, the casing being provided at its lowest point with a steam-inlet substantially tangential to the cylinder, and guides for the shaft of the cylinder permitting the cylinder to rest in the bottom of the casing, said guides permitting the shaft to rise when steam is admitted to counterbalance the weight of the cylinder, substantially as described.

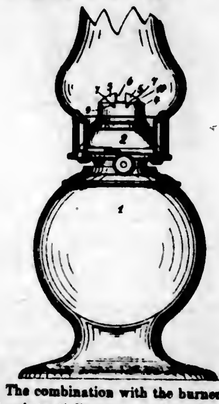
2. In a rotary engine, the combination of a substantially cylindrical casing, a cylinder rotating therein having longitudinal vanes and terminal cylindrical portions, packing-rings around said cylindrical portions, the casing being provided at the bottom with oppositely-directed inlet-ports substantially tangential to the cylinder, means for controlling said ports whereby they may be used alternately for reversing the direction of the cylinder, boxes for the shaft of the cylinder, and vertical slideways for said boxes, whereby the upward pressure of the live steam counterbalances more or less the weight of the cylinder, substantially as described.

3. In a rotary engine, the combination of a substantially cylindrical casing, a cylinder rotating therein having longitudinal vanes and terminal cylindrical portions, packing-rings around said cylindrical portions, the casing being provided at the bottom with oppositely-directed inlet-ports substantially tangential to the cylinder, means for controlling said ports whereby they may be used alternately for reversing the direction of the cylinder, boxes for the shaft of the cylinder, and vertical slideways for said boxes, whereby the upward pressure of the live steam counterbalances more or less the weight of the cylinder, and means for laterally adjusting said slideways, substantially as described.

4. In a rotary engine, the combination of a substantially cylindrical casing, a cylinder rotating therein having longitudinal vanes and terminal cylindrical portions, packing-rings around said cylindrical portions, the casing being provided at the bottom with oppositely-directed inlet-ports substantially tangential to the cylinder, means for controlling said ports whereby they may be used alternately for reversing the direction of the cylinder, boxes for the shaft of the cylinder, vertical slideways for said boxes, whereby the upward pressure of the live steam counterbalances more or less the weight of the cylinder, and screws limiting the upward movement of the boxes, substantially as described.

5. In a rotary engine, the combination of a substantially cylindrical casing, a cylinder rotating therein having longitudinal vanes and terminal cylindrical portions, packing-rings around said cylindrical portions, the casing being provided at the bottom with oppositely-directed inlet-ports substantially tangential to the cylinder, and each extending circumferentially about twice the distance between the vanes, means for controlling said ports whereby they may be used alternately for reversing the direction of the cylinder, boxes for the shaft of the cylinder, and vertical slideways for said boxes, whereby the upward pressure of the live steam counterbalances more or less the weight of the cylinder, substantially as described.

809,055. EXTINGUISHER. ANTON HASLINGER, Allegheny, Pa. Filed July 29, 1905. Serial No. 271,226.



Claim.—1. The combination with the burner of a lamp and its wick-casing of substantially segment-shaped members pivotally mounted on said burner, depending plates carried by each member, adjacent the wick-casing and normally parallel to the side thereof, said members being adapted to alternately fold inwardly upon said wick-casing, the depending plate of that member which is folded inwardly bearing, at that position, upon the top of the wick-casing.

2. The combination with the burner of a lamp and its wick-casing, of substantially segment-shaped members pivotally mounted in said burner, depending perforated plates carried by each member adjacent to said wick-casing, said members being adapted to alternatively fold inwardly upon said wick-casing, the perforated plate of that member which is folded inwardly bearing at that position upon the top of the wick-casing.

809,056. ERASER-HOLDER. FREDERICK W. HAYES, Detroit, Mich. Filed June 19, 1905. Serial No. 265,865.

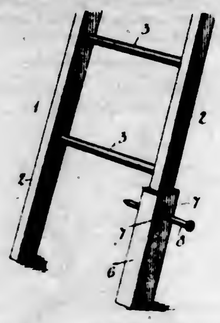
Claim.—1. In combination with a tubular rubber-holder adapted to be secured to the end of a pencil, the terminal of said holder being conically threaded, a plurality of extension-nipples threaded both externally and internally, the first adapted to engage over said terminal and the other over the first, and an erasing-rubber projecting through said terminal and nipples, substantially as described.

2. In combination with a rubber-holder provided with an opening therethrough and with an externally-threaded conical terminal at one end thereof, an extension-nipple screw-threaded on both its outer and inner faces and adapted to engage said terminal, and a second nipple similarly threaded, and adapted to engage said extension-nipple, whereby the nipples may be placed in continuous order, substantially as described.

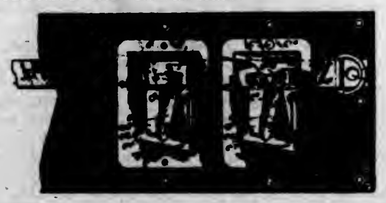
809,057. ATTACHMENT FOR LADDERS. JAMES K. HEWES, Rhinecliff, N. Y. Filed June 15, 1905. Serial No. 265,276.

Claim.—The herein-described attachment for ladders, consisting of a plain, hollow, rectangular sleeve, having formed therein two diagonally-disposed apertures 7, in combination with a ladder having formed in one of its side bars at the lower end thereof a series of apertures, said apertures being arranged in zigzag relation, and a

pin or bolt 8 adapted to be projected through said apertures in the sleeve and side bar of the ladder, for the purpose described.



809,058. MAIL-POUCH FASTENER. LOUIS H. HINAMAN, Port Jervis, N. Y., assignor of three-fourths to Titus Hinaman, Kellam, Pa. Filed June 24, 1905. Serial No. 266,844.



Claim.—1. A mail-pouch comprising an open sack having one of the sides of its open end provided with a transverse series of staples, and the opposite side provided with a transverse series of slots for receiving the staples, a flap secured to the first side and provided with transverse slots to receive the staples and with a longitudinal opening therethrough adjacent to the staples, a series of locks for the staples, comprising each a plate secured to the flap and provided with an opening registering with the slot in the flap and with an opening registering with the longitudinal opening in the flap, a locking-bolt slidably mounted on the plate and adapted to engage a staple, a lug on the bolt, a latch pivoted to the plate and provided with a lug engaging with the lug on the bolt, a spring for normally maintaining the latch in engagement with the bolt, a lever pivoted to the plate for actuating the locking-bolt, a cam on the lever for actuating the latch to release the bolt, an arm on the lever extending over the opening in the plate, a second plate inclosing the lock, a lever pivoted to the second plate and provided with a lug for engaging the sliding bolt, means whereby the lever may be actuated to release the lug from the locking-bolt, means for simultaneously actuating the series of locks comprising a flexible strap in the longitudinal opening in the flap, lugs on the strap for engaging the arms of the levers, and a lock traversing the ends of the strap and the pouch for preventing movement of the strap.

2. The combination with a mail-pouch provided with a transverse series of staples, and a flap having openings to receive the staples, locks for the staples comprising each a casing having an opening to receive the staples, a locking-bolt in the casing for engaging the staple, a latch for locking the bolt in position, a lever for actuating the bolt, a cam on the lever for releasing the latch, a lever pivoted within the casing, a lug on the lever for engaging the bolt to retain it in its locked position, means for releasing the lug, a strap within the flap and provided with lugs for engaging the ends of the actuating-levers whereby the bolts may be actuated simultaneously, and means for preventing movement of the strap.

3. The combination with a mail-pouch provided with a transverse series of staples, and a flap having openings to receive the staples, of locks for the staples comprising each a casing having an opening to receive the staple, a locking-bolt within the casing for engaging the staple, a latch for locking the bolt in position, a lever for actuating the locking-bolt, a cam on the lever for releasing the latch, and a strap within the flap and provided with lugs for engaging the actuating-levers whereby the locking-bolts may be actuated simultaneously.

4. The combination with a mail-pouch provided with a transverse series of staples and a flap having openings to receive the staples, of locks for the staples comprising each a casing having an opening to receive the staples, a locking-bolt within the casing for engaging the staples, a latch for locking the bolt in position, a lever for actuating the bolt, means on the lever for releasing the latch, means within the flap for engaging the actuating-levers to simultaneously actuate the locking-bolts, means within the casing of one of the locks for retaining the locking-bolt in its locked position, and means for releasing said retaining means.

5. The combination of a mail-pouch provided with a transverse series of staples and a flap having openings to receive the staples, of a series of locks for the staples each comprising a casing having an opening to receive the staple, means within the casing for engaging the staple to lock the same, means within the casing for retaining said engaging means in position, means within the casing for actuating the locking means and for simultaneously releasing the retaining means, and a single means engaging the actuating means of each of the series for simultaneously actuating the locking means.

6. The combination with a mail-pouch provided with a series of staples and a flap having openings to receive the staples, of a series of locks for the staples, comprising each a casing having an opening to receive the staple, means within the casing for engaging the adjacent staple, means for retaining the engaging means in position, means for actuating said engaging means and for simultaneously releasing the retaining means, and a single means engaging each of the actuating means of the series of locks for simultaneously actuating the staple-engaging means.

7. The combination with a mail-pouch provided with a transverse series of staples, and a flap having openings to receive the staples, of a series of locks for the staples, comprising a casing having an opening to receive the staple, means within the casing for engaging the staples to lock the same, means for retaining the locking means in position and single means for simultaneously actuating each of the staple-engaging means, and for releasing the retaining means.

809,059. TOY PISTOL. LOUIS H. HINAMAN, Port Jervis, N. Y., assignor of one-fourth to Titus Hinaman, Kellam, Pa. Filed June 24, 1905. Serial No. 266,845.

Claim.—1. A toy pistol comprising a barrel and a grip formed of two symmetrical concave halves, a screw-threaded bolt traversing the halves adjacent the junction of the barrel and grip, a nut engaging the bolt to secure the halves together, a hammer pivoted in the bolt, a plunger slidably mounted within the barrel and provided with a transverse slot at its outer end, connecting-rods between the plunger and the hammer, a rearwardly-projecting arm on the plunger and provided with a recess for engaging the bolt, a spring for retaining the arm in engagement with the bolt, a trigger pivoted to the bolt, a lug on the trigger for releasing the arm, and a spring for actuating the plunger comprising a rubber band traversing the slot therein, the free ends of the band extending without the open ends of the barrel, and a ring on the barrel for securing the ends of the band thereto, substantially as described

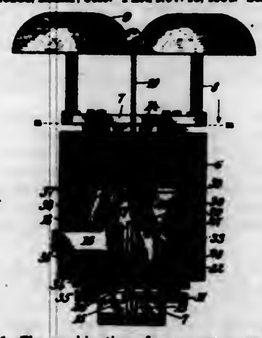
2. A toy pistol comprising a casing composed of two symmetrical concave halves, formed to represent a barrel and grip, means for securing the halves together, a hammer pivoted within the grip, a plunger slidably mounted within the barrel, means connecting the hammer and the plunger, a rearwardly-extending arm on the plunger, means engaging the arm to retain it in its rearward position, a trigger for releasing said arm, and a spring for actuating the plunger comprising a rubber band secured at its central point to the plunger, the free ends extending through the open ends of the barrel and a ring for securing the ends of the band to the barrel, substantially as described.

3. A toy pistol comprising a casing composed of two symmetrical halves secured together and shaped to represent a pistol barrel and grip, a sliding plunger within the barrel, a hammer pivoted within the grip, connections between the hammer and the plunger whereby when the hammer is set the plunger will be drawn to the rear of the barrel, means for retaining the hammer in the set position, a trigger for releasing said retaining means, and a spring for actuating the plunger comprising a rubber band secured thereto, and extending outwardly through the open end of the barrel, and a ring on the barrel engaging the ends of the rubber band to retain it in position, substantially as described.

4. A toy pistol comprising a casing, a plunger slidably mounted therein, a hammer, means whereby when the hammer is set the plunger is drawn to the rear, means for retaining the hammer in its set position, a trigger for releasing said retaining means, elastic means for actuating the plunger connected therewith and extending without the open end of the barrel, and a ring on the barrel engaging said elastic means.

5. A toy pistol comprising a casing, a plunger slidably mounted therein, a hammer, means whereby when the hammer is set the plunger is drawn to the rear, means for retaining the hammer in its set position, a trigger for releasing said retaining means, elastic means for actuating the plunger connected therewith and extending outwardly through the open end of the barrel, and means on the barrel for engaging said elastic means.

809,060. RINGER FOR TELEPHONES AND THE LIKE. HENRY R. HOUSE, Lamar, Colo. Filed Nov. 10, 1904. Serial No. 232,117.



Claim.—1. The combination of a magnet, a supporting-plate, mechanism connected with said supporting-plate and adjusted relatively thereto, said mechanism being provided with brackets, springs connected with said brackets and depending therefrom, and an armature mounted upon said springs and free to rock by the resilience thereof.

2. The combination of a magnet, a supporting-plate, mechanism connected with said supporting-plate and adjustable relatively thereto, said mechanism being provided with brackets, springs connected with said brackets and depending therefrom, an armature mounted upon said springs and free to rock by the resilience thereof, and means for adjusting the position of said brackets relatively to said supporting-plate.

3. The combination of a magnet, a supporting-plate disposed adjacent thereto and provided with a slot, a yoke provided with a portion disposed adjacent to said supporting-plate and provided with a fastening member extending through said slot for the purpose of enabling said portion to be adjusted to different angles relatively to said supporting-plates, springs connected with said yoke and depending therefrom, an armature mounted upon said springs and free to vibrate by the resilience thereof, a clapper mounted upon said armature and adapted to be actuated thereby, and a bell to be struck by said armature.

4. The combination of a magnet, a supporting-plate disposed adjacent thereto, a yoke provided with a head disposed adjacent to said supporting-plate, means for adjusting said head relatively to said supporting-plate, brackets mounted upon said head and upon said yoke respectively, springs adjustably mounted within said brackets and depending therefrom, an armature mounted upon said springs, a clapper supported by said armature, and bells to be struck by said clapper.

5. The combination of a magnet, a supporting-plate disposed adjacent thereto, an arm mounted upon said supporting-plate and provided with a slot, a yoke supported by said supporting-plate and provided with a head, a member mounted upon said head and projecting through said slot in said arm, means for moving said arm into different radial positions for the purpose of adjusting said head relatively to said supporting-plate, springs connected with said head and with said yoke, an armature mounted upon said springs, a clapper connected with said armature and actuated by movements thereof, and bells to be struck by said clapper.

809,061. CHAIR. HENRY H. HOOVER, Fort Smith, Ark. Filed Feb. 4, 1905. Serial No. 244,189.

Claim.—1. A corner-iron stamped from sheet metal and fashioned into angular shape, the iron being provided with an upper receiving-surface, having one side edge made extended, and a fastening-tongue on the other side edge of the receiving-surface, with the same located at the bend in the iron, substantially as described.

2. A corner-iron having an upper receiving-surface and bent into shape at a reduced portion with its ends disposed at an angle, one to the other, and projecting tongues at the reduced portion, the iron being provided with perforations, substantially as described.

3. An angular iron formed with round receiving-troughs on its upper side, one side edge of the iron being made the higher, a reduced portion in the iron, tongues at the reduced portion, and means adapting the angular iron for attachment, substantially as described.

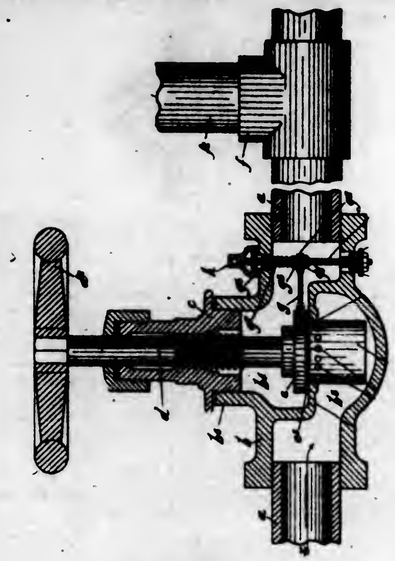
809,062. DOOR CHECK OR FASTENER. CHARLES H. P. INGALLS, Lynn, Mass. Filed Apr. 3, 1905. Serial No. 253,806.

Claim.—The herein-described door-check comprising a casing, a plunger-bar mounted to slide in said casing and provided with a series of ratchet-teeth on one side thereof, a pawl pivoted within the casing and designed to engage the teeth on the plunger to hold said plunger in projected position, a pivotally-mounted foot-lever connected to said pawl by a link, a spring secured to the casing and bearing at its free end against said foot-lever to hold the pawl in engagement with the teeth on the plunger, a spring surrounding the plunger within the casing, an adjustable ring on the plunger for regulating the tension of the spring, an elastic shoe upon the lower end of the plunger and a foot-piece on the upper end of said plunger, all substantially as described.

809,063. DRAIN-VALVE FOR HYDRANT-PIPES. FREDERICK A. JACOBS, Jamaica, N. Y. Filed Apr. 13, 1905. Serial No. 255,261.

Claim.—A valve device designed for use in a supply-pipe of a hydrant adjacent the hydrant connection, said valve device comprising a casing provided with a horizontal partition dividing said casing into top and bottom chambers, a threaded valve-stem passing downwardly into the valve-chamber within said casing and provided with a valve adapted to close a port or passage in said partition, said port or passage being normally closed; a valve-rod vertically movable through the end of the casing adjacent to the hydrant connec-

tion and provided with a valve adapted to close a port or passage in the bottom of said casing which is normally open; an arm connected with the first-named valve and with said valve-rod, a spring mounted on said rod above said valve, a collar secured to said rod above said spring, and means for limiting the upward movement of said rod, substantially as shown and described.

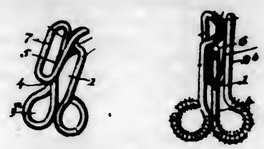


809,064. MARINE VESSEL. JOHN B. JOHNSON, Ishpeming, Mich. Filed June 30, 1905. Serial No. 267,746.

Claim.—1. A marine vessel having a hull, a propeller-shaft mounted at each side thereof and inclining with respect to the water-line of the hull, the lower ends of the shafts projecting below the hull, propellers carried by said ends of the shafts, means for mounting and driving the shafts, thrust-bearings engaged with the upper ends of the shafts, and a supporting-beam extending transversely across the hull and having its ends projected beyond the sides thereof, said ends of the supporting-beam carrying said thrust-bearings.

2. A marine vessel having a hull, a shaft mounted thereon, an engine-shaft extending fore and aft in the vessel, transverse shafts extending through the sides of the hull and geared with the engine-shaft, outside propeller-shafts mounted at each side of the hull and respectively geared with the ends of the transverse shafts, said propeller-shafts inclining downwardly and rearwardly, and propellers attached to the lower ends of the shafts.

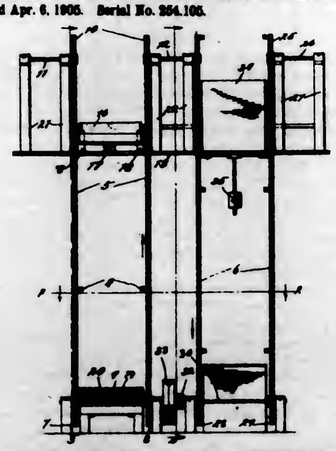
809,065. HOOK. LORA JOHNS, Newton, Kans., assignor to The De Long Hook and Eye Company, Philadelphia, Pa., a Corporation of West Virginia. Filed Jan. 14, 1905. Serial No. 241,049.



Claim.—1. A hook having a shank with eyes at one extremity thereof for attaching the same, a bill projecting from the extremity of said hook remote from said eyes, consisting of two bars spaced apart to form an opening therebetween, said shank having a lateral offset in the plane of said eyes, the offset to receive threads and said opening being above said offset whereby the sewing-needle may pass upwardly.

2. A hook having a shank comprising two members with eyes at one extremity thereof for attaching the same, a bill projecting from the extremity of said hook remote from said eyes, consisting of two bars spaced apart to form an opening therebetween, said members having lateral abutting offsets substantially in the plane of said eyes adapted to receive threads, said opening being disposed above said offsets whereby the sewing-needle may pass upwardly.

809,066. HOIST OR ELEVATOR. CLAUS A. JUEL, Chicago, Ill. Filed Apr. 6, 1905. Serial No. 254,105.



Claim.—1. In an elevator or hoist the combination of two sets of vertically-arranged endless belts, one or more receptacles for the material to be hoisted, means on said belts and receptacles whereby the receptacles are supported upon the belts, means for supporting the receptacles between the belts preparatory to the hoisting thereof by the belts, and means for driving the belts in opposite directions.

2. In an elevator or hoist the combination of two sets of vertically-driven belts, a receptacle for the material to be hoisted, means on the belts and receptacle whereby the belts engage and lift the receptacle, means at the lower end of one set of said belts for supporting a receptacle to be elevated between the belts, means at the upper end of the same set of belts for catching the elevated receptacle, arranged between the belts, means at the upper end of the other set of belts for holding the receptacle to be lowered, between the latter set of belts, and means at the lower end of the second set of belts for catching the lowered receptacle.

3. In an elevator or hoist the combination of two pairs of vertically-driven belts, one or more receptacles for the material to be elevated, means on said receptacles and belts whereby the receptacles are engaged and raised by the belts, means between the belts of one pair at the lower end for supporting a receptacle to be elevated, means between the belts of the same pair at the upper end, but on the opposite side for catching the elevated receptacle while coming downwardly means between the belts of the second pair at the upper end for holding a receptacle to be lowered, means between the belts of the second pair at the lower ends but on the opposite side for catching the lowered receptacle and means for driving said belts.

4. In an elevator or hoist the combination of two pairs of upright belts, a receptacle for the material to be elevated, means on said belts and receptacles whereby the receptacle is engaged and elevated by the belts, means between the belts of one pair at the lower end for supporting a receptacle to be elevated, a hinged incline projecting between the same pair of belts at the upper end in the line of movement of the receptacle while on that pair of belts, for catching the elevated receptacle, a normally elevated, hinged support between the belts of the second pair at the upper end for supporting a receptacle to be lowered, and means between the belts of the second pair at the lower end for catching the lowered receptacle.

809,067. SIEMENS REGENERATIVE FURNACE. ADALBERT KUHNWEINHART, Eurkmantel, near Teplitz, Austria-Hungary. Filed Mar. 16, 1905. Serial No. 250,408.

Claim.—1. In a Siemens regenerative furnace, the flue for products of combustion, a passage between the gas-regenerative chambers and the flue, a cut-off in said passage, and means for causing the gases to flow, previous to reversing the apparatus, from the flue through the said passage into the gas-regenerative chamber, whereby the flue-gases cause a displacement into the furnace of the combustible gases contained in the gas-regenerative chamber, substantially as described.

2. In a Siemens regenerative furnace, the flue for products of combustion, a passage between the gas-regenerative chambers and the flue, a cut-off in said passage and means for sucking the flue-gases, previous to reversing the apparatus, from the flue through the said passage into the gas-regenerative chamber, whereby the sucking action causes a displacement into the furnace of the combustible gases contained in the regenerative chamber, substantially as described.

3. In a Siemens regenerative furnace, the flue for products of combustion, a passage between the gas-regenerative chamber and the flue, a cut-off in said passage, and means for mechanically impelling the flue-gas from the flue through the said passage into the gas-regenerative chamber previous to reversing the apparatus, substantially as described.

4. In a Siemens regenerative furnace, the flue for products of combustion, a passage between the gas-regenerative chamber and the flue, and a suction and pressure device in said passage for causing the gases to flow, previous to reversing the apparatus, from the flue through the said passage into the gas-regenerative chamber, substantially as described.

809,068. COMPOSITION OF MATTER. DAVID LOEWENSTEIN, Chicago, Ill. Filed July 15, 1904. Serial No. 216,757.

Claim.—1. The herein-described composition of matter consisting of French glue, shellac, a solvent, starch and water, substantially as and for the purpose specified.

2. A composition of matter consisting of French glue, shellac, an alcoholic solvent, starch, water, and alum, substantially as specified.

3. As a new composition of matter the mixture containing French glue, shellac, a solvent, starch, water, alum, and ammonia, substantially as specified.

4. The herein-described composition of matter, consisting of French glue, shellac, a solvent, starch, water, alum, ammonia, and glycerin, substantially as specified.

5. As a new composition of matter the mixture containing French glue, shellac, alcohol, starch, water, alum, ammonia, and glycerin, substantially as specified.

6. The herein-described composition of matter consisting of French glue, shellac, alcohol, starch, water, alum, ammonia, glycerin, and coloring-matter, substantially as specified.

7. The herein-described composition of matter consisting of French glue, shellac, an alcoholic solvent, starch, and water commingled in the presence of heat, substantially as specified.

8. The herein-described composition of matter consisting of French glue, shellac, an alcoholic solvent, starch, and water commingled in the presence of steam, substantially as specified.

9. As a new composition of matter the mixture containing French glue, shellac, alcohol, starch, and water agitated and commingled in the presence of live steam, substantially as specified.

10. The herein-described composition of matter consisting of French glue, shellac, an alcoholic solvent, starch, water, and glycerin commingled in the presence and by the action of steam, substantially as specified.

11. The herein-described composition of matter consisting of French glue, shellac, alcohol, starch, water, glycerin, and ammonia agitated and commingled in the presence of heat, substantially as specified.

12. The herein-described composition of matter consisting of French glue, shellac, alcohol, starch, water, glycerin, ammonia, and alum commingled in the presence of heat, substantially as specified.

13. The herein-described composition of matter consisting of French glue, shellac, alcohol, starch, water, glycerin, ammonia, alum, and coloring-matter commingled in the presence of heat, substantially as specified.

14. As a new composition of matter the mixture consisting of French glue, shellac, an alcoholic solvent, starch, water, and coloring-matter substantially as and for the purpose specified.

15. A composition of matter consisting of French glue, shellac, an alcoholic solvent, starch, water, and glycerin, substantially as specified.

16. A composition of matter consisting of French glue, shellac, an alcoholic solvent, starch, water, and ammonia, substantially as specified.

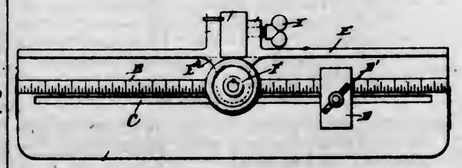
17. A composition of matter consisting of French glue, shellac, an alcoholic solvent, starch, water, alum, and coloring-matter, substantially as specified.

18. A composition of matter consisting of French glue, shellac, an alcoholic solvent, starch, water, glycerin, and coloring-matter, substantially as specified.

19. A composition of matter consisting of French glue, shellac, an alcoholic solvent, starch, water, ammonia, and coloring-matter, substantially as specified.

20. A composition of matter consisting of French glue, shellac, alcohol, starch, water, and coloring-matter agitated and commingled in the presence of steam, substantially as specified.

809,069. DOWELING-MACHINE. JAMES L. LOVETT, New London, Pa. Filed May 10, 1905. Serial No. 259,657.



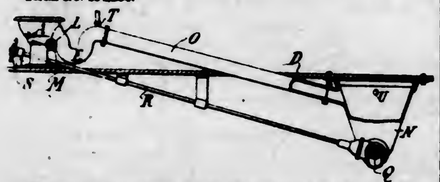
Claim.—1. In a machine of the character described, a table upon which the material to be bored is adapted to lie, a vertical back formed with the table against which one edge of the material is adapted to be placed, a movable gage-block adapted to abut against the end of the material, means for clamping the material downward upon the table, a vertical sliding drill-block arranged in the back of the device, said drill-block provided with different size openings formed therethrough, said openings to form a guide for the drill, and means for securing said block in any position placed, as and for the purpose specified.

2. In a device of the character described, a plate upon which the material is adapted to rest, a plate forming a back extending at right

angles from the rearward edge of the first-named plate against which one edge of the material is adapted to lie, the bed-plate being provided with a longitudinal guideway, a gage-block adapted to slide in said longitudinal guideway and abut against the end of the material, means for securing said gage-block in any position placed, means for clamping the material downward upon the bed-plate, two vertical lugs extending rearward from the back, a drill-block adapted to slide vertically between said lugs, said drill-block provided with lateral openings of different size formed therethrough from the front to the rear, said openings adapted to form guides for the drill, and means for securing said drill-block in any position placed, as and for the purpose specified.

3. In a device of the character described, a bed-plate having graduations marked thereon, said bed-plate provided with a longitudinal slot, a gage-block adapted to slide in said slot, means for securing said gage-block in place, a back rising at right angles to the bed-plate against which one edge of the material is adapted to rest, an ear extending forward from the upper end of the back, a clamp-screw threaded through said ear and adapted to be forced downward upon the material, a drill-guide block adapted to slide vertically in the back, the forward edge of the drill-block being flush with the front face of the back, said drill-block being provided with different size holes bored therethrough from the front to the back, said holes being arranged one above the other, graduations arranged alongside of the drill-block to enable the block to be moved so that any one hole can be brought to a certain point, and means for securing the block in any position set, as and for the purpose specified.

809,070. SEWERAGE SYSTEM FOR TRAINS. JOHN H. METTENHEIMER and WILLIAM L. HERRLIN, Austin, Tex. Filed Feb. 16, 1904. Serial No. 194,226.



Claim.—1. A sewerage system for trains and the like, including in combination a water-closet bowl A with a direct vertical outlet C, a tank N into which the sewage is to be discharged and retained and from which it may be discharged at will, a trap E outside of said bowl and between said bowl and said tank, and a valve F which in one position closes the pipe C and forms the bottom of the bowl so that the sewage passes through the trap into said tank, and which in another position closes the trap E and forms the side of the bowl so that the sewage is discharged directly through said vertical outlet without passing through said trap.

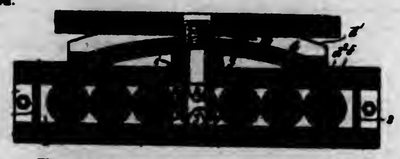
2. A sewerage system for trains and the like, including in combination a water-closet bowl, a tank N into which the sewage may be discharged and which is adapted to retain the sewage and to permit the discharge of the same at will, an unobstructed straight outlet-pipe C from the bottom of said closet-bowl, a pipe O and trap E connecting said tank with the side of said bowl, a valve F which in one position forms the bottom of the bowl and closes the straight outlet-pipe and which in another position forms the side of the bowl and cuts off the trap E, a discharge-valve Q from said tank having a hand-operated controlling device in the vicinity of the bowl, and a steam-pipe U entering said tank.

809,071. MEANS FOR SUPPORTING THE EXPANSION ENDS OF BRIDGES, &c. PELHAM B. MOSLEY, Montreal, Canada. Filed May 5, 1905. Serial No. 258,862.

Claim.—1. The combination with a pair of bearing members, having a nest of rollers between them, of means effecting a sliding connection between each bearing members and rollers for the purpose of correcting any tendency of the rollers to deviate from any position with their axes at right angles to their plane of travel.

2. The combination with a pair of bearing members, having a nest of rollers between them, of means effecting a sliding connection between each bearing members and rollers for the purpose of correcting any tendency of the rollers to deviate from any position with their axes at right angles to their plane of travel, and such means limiting the extent of movement of such parts relatively to one another.

3. The combination with a pair of bearing members having a rolling member between them, of means carried by one of such members and effecting a sliding engagement with a member next to it for the purpose of maintaining the members constantly in the same relation.



4. The combination with a pair of bearing members having a rolling member between them, of means carried by one of such bearing members and effecting a sliding engagement with the rolling member for the purpose of maintaining the members constantly in the same relation.

5. The combination with a pair of bearing members having a rolling member between them, one of such members having a hole therein presenting a face with which one of the faces of a projection carried by another of the members makes sliding contact for the purpose of maintaining the members constantly in the same relation.

6. The combination with a pair of bearing members having a rolling member between them, one of such members having a hole therein presenting a face with which one of the faces of a projection carried by another of the members makes sliding contact for the purpose of maintaining the members constantly in the same relation one of such faces being of cycloidal formation.

7. The combination with a pair of bearing members having a rolling member between them, one of such members having a hole therein presenting a face with which one of the faces of a projection carried by another of the members makes sliding contact for the purpose of maintaining the members constantly in the same relation, the contacting face of the projection being of cycloidal formation.

8. The combination with a pair of bearing members having a nest of rollers between them, and means for spacing such rollers, of a device carried by one of the bearing members and presenting a face adapted to make sliding contact with the face presented by one of the walls of a hole in the perimeter of one of the rollers for the purpose of maintaining the bearing members and rollers constantly in the same relation.

9. The combination with a pair of bearing members having a nest of rollers between them, and means for spacing such rollers, of a device carried by one of the bearing members and presenting a face adapted to make sliding contact with the face presented by one of the walls of a hole in the perimeter of one of the rollers for the purpose of maintaining the bearing members and rollers constantly in the same relation, one of such faces being of cycloidal formation.

10. The combination with a pair of bearing members having a nest of rollers between them and means for spacing such rollers, of a device carried by one of the bearing members and presenting a face adapted to make sliding contact with the face presented by one of the walls of a hole in the perimeter of one of the rollers for the purpose of maintaining the bearing members and rollers constantly in the same relation, the contacting face of the device being of cycloidal formation.

11. The combination with a pair of bearing members, having a nest of rollers between them one of such rollers having a pair of holes in the perimeter thereof one near each end, and means for spacing such rollers, of a pair of conoidal dowels carried by one of the bearing members and projecting into the holes in the roller.

12. The combination with a pair of bearing members, having a nest of rollers between them one of such rollers having a pair of holes in the perimeter thereof one near each end, and means for spacing such rollers, of a pair of dowels carried by one of the bearing members and projecting into the holes in the roller, such dowels being of conoidal formation and cycloidal in axial direction.

13. The combination with a pair of bearing members, having a nest of rollers between them one of such rollers having a pair of holes extending diametrically therethrough one near each end, and means for spacing such rollers, of a pair of conoidal dowels carried by one of the bearing members and projecting into the adjacent ends of the holes in the roller, and a second pair of dowels carried by the other bearing member and projecting into the opposite ends of the holes.

14. The combination with a pair of bearing members, having a nest of rollers between them one of such rollers having a pair of holes extending diametrically therethrough one near each end, and means for spacing such rollers, of a pair of dowels carried by one of the bearing members and projecting into the adjacent ends of the holes in the roller, and a second pair of dowels carried by the other bearing members and projecting into the opposite ends of the holes, such dowels being of conoidal formation and cycloidal in axial direction.

15. The combination with a pair of bearing members having a roller-bearing between them, of a dust-guard fitting closely between the bearing members and encircling the roller-bearing, one of the bearing members being movable relatively to the dust-guard, and the said dust-guard being free to move independently of both bearing members.

16. The combination with a pair of bearing members having a roller-bearing between them, of a rectangular dust-guard fitting closely between the bearing members and encircling the roller-bearing, one of the bearing members being movable relatively to the dust-guard and the said dust-guard being free to move independently of both bearing members.

17. The combination with a pair of bearing members having a roller-bearing between them, of a rectangular dust-guard free of and fitting closely between the bearing members and encircling the roller-bearing, such dust-guard consisting of a pair of parallel bars of channel cross-section, and a pair of bars having their ends secured rigidly to the ends of the channel-bars, such bars being slightly less in height than the distance between the bearing members.

18. The combination with a pair of bearing members having between them a nest of rollers with their ends diminished, of a rectangular dust-guard free of and fitting closely between the bearing members and encircling the rollers, such dust-guard consisting of a pair of parallel bars of channel cross-section formed with openings through which the diminished ends of the rollers project, and a pair of flat bars having their ends bent at right angles and secured rigidly to the ends of the channel-bars, such bars being slightly less in height than the distance between the bearing members.

19. The combination with a pair of bearing members having between them a nest of rollers with their ends diminished, of a dust-guard fitting closely between the bearing members and consisting of a pair of parallel bars of channel cross-section formed with holes through which the diminished ends of the rollers project, such holes being of sufficient dimensions to allow of limited play of the guard between the bearing members, and means securing the bars against axial movement relatively to the rollers, the channel-bars being slightly less in height than the distance between the bearing members and the said dust-guard being free to move independently of both bearing members.

20. The combination with a pair of bearing members having, between them, a nest of rollers with their ends diminished, of a rectangular dust-guard free of and fitting closely between the bearing members and encircling the rollers such dust-guard consisting of a pair of parallel bars of channel cross-section formed with holes through which the diminished ends of the rollers project such holes being of sufficient dimensions to allow of limited play of the guard between the bearing members and a pair of bars having their ends secured rigidly to the ends of the channel-bars, such bars being slightly less in height than the distance between the bearing members.

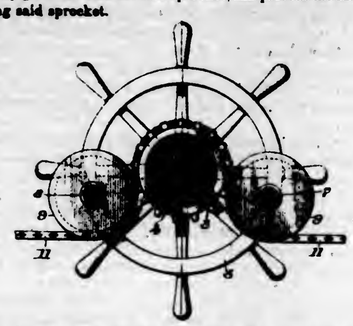
21. The combination with a pair of bearing members having, between them, a nest of rollers with their ends diminished, of spacer-bars at the opposite ends of the rollers and having holes fitting closely upon the diminished ends of the rollers, a rectangular dust-guard free of and fitting closely between the bearing members and encircling the rollers and the spacer-bars, such dust-guard consisting of a pair of parallel bars of channel cross-section formed with longitudinal slots, through which the diminished ends of the rollers project, and a pair of bars having their ends secured rigidly to the ends of the slotted bars, such bars being slightly less in height than the distance between the bearing members.

809,072. STEERING DEVICE FOR BOATS. ALONZO B. MCCOY, Burlington, N. J. Filed Mar. 14, 1905. Serial No. 249,696.

Claim.—1. In a device of the character described, a sprocket rotatably mounted, a chain in engagement therewith and in suitable connection with the rudder and means situated adjacent said sprocket serving both to properly guide the chain thereto and to act as guards for preventing the chain from leaving said sprocket, whereby fouling is prevented.

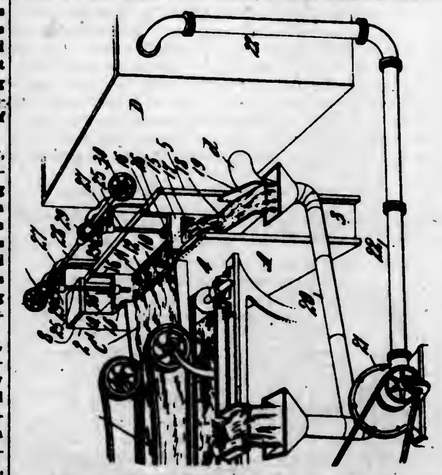
2. In a device of the character described, a sprocket rotatably mounted, a chain in engagement therewith and in suitable connection with the rudder and pulleys situated adjacent said sprocket serving to properly guide the chain thereto and to act as guards to prevent the chain from leaving said sprocket.

3. In a device of the character described, a sprocket rotatably mounted on a frame, a chain in engagement therewith and in suitable connection with a rudder, and pulleys mounted on the frame and so located with respect to said sprocket that the teeth thereof pass into the grooves of said pulley whereby said pulleys serve both to properly guide the chain to said sprocket, and prevent the same from leaving said sprocket.



4. In a device of the character described, a sprocket rotatably mounted, a chain in engagement therewith and in suitable connection with a rudder, pulleys mounted adjacent said sprocket and having grooves in their periphery into which the teeth of said sprocket are adapted to pass, whereby the said pulleys serve both to guide the chain and to prevent the same from leaving said sprocket and means for operating the said sprocket.

809,073. HEAD-BOX FOR PAPER-MACHINES. WILLIAM MCNAUGHT, Holyoke, Mass. Filed May 19, 1905. Serial No. 261,206.



Claim.—1. In a paper-machine, the combination with a head-box having a pulp-inlet, and a pulp-outlet, and a lower-positioned relief-outlet, of a surface-regulating trough, having end closure heads, and guided for vertical movement within the head-box, and having a discharge-aperture, in one of its end closure-heads, communicating with the head-box relief-outlet, and means for regulating the height of said trough.

2. In a paper-machine, the combination with a head-box having a pulp-inlet, and a pulp-outlet, and a lower-positioned relief-outlet, of a surface-regulating trough, having end closure-heads and guided for vertical movement within the head-box, and having a discharge-aperture in one of its end closure-heads, communicating with the head-box relief-outlet, means for regulating the position of said trough, and a pump connecting with said relief-outlet and delivering the pulp received therefrom to the rear of the head-box inlet.

3. In a paper-machine, the combination with a head-box having a pulp-inlet, and a pulp-outlet, and a lower-positioned relief-outlet, of a surface-regulating trough, narrower than the width of the head-

box, having an opening or openings between it and the adjacent side wall or walls of the head-box, said trough having end-closure-heads, guided for vertical movements within the head-box and having a discharge-aperture in one end closure-head, communicating with the head-box relief-outlet, and means for regulating the height of said trough.

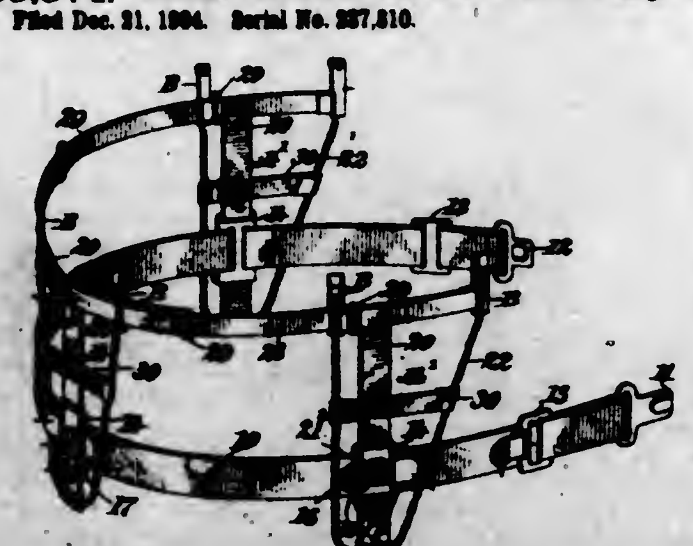
4. In a paper-machine, the combination with a head-box having a rear-side pulp-inlet, a front-side pulp-outlet, and a lower-positioned endwise-located relief-outlet, of a surface-regulating trough guided for vertical movement within the head-box and having an opening at one end communicating with the head-box relief-outlet, and means for regulating the vertical position of said trough relatively to the head-box outlet.

5. In a paper-machine, the combination with a head-box having a rear-side pulp-inlet, a front-side pulp-outlet, and a lower-positioned, endwise-located, relief-outlet, of a surface-regulating trough guided for vertical movement within the head-box, and having an opening at one end communicating with the head-box relief-outlet, a pair of vertical screw-shafts engaging end portions of the trough, and having bevel gear-wheels on upper portions thereof, a horizontally-mounted shaft having bevel gear-wheels in mesh with the screw-shaft gears, and means for rotating said horizontal shaft.

6. In a paper-machine, the combination with a head-box having oppositely-paired vertical grooves 16, 16, in the walls thereof, having a pulp-inlet, an apron-provided pulp-outlet, and a lower-positioned relief-outlet, of a surface-regulating trough having end closure-heads which engage and are guided in the said grooves, a discharge-aperture in one end closure-head communicating with the head-box relief-outlet, means connected with said relief-outlet for conveying the pulp passed through said relief-outlet back of the head-box, and means for adjusting the height of the said trough.

7. In a paper-machine, the combination with a screen-box and the head-box forward thereof, and having a rear-side pulp-inlet in connection with the screen-box, a forward-side horizontal overflow-outlet, and an endwise-located relief-outlet opening at a level below the said overflow-outlet, of a V-shaped upwardly-open trough narrower than, and centrally and horizontally positioned within the upper portion of the head-box, with openings between its edges and the front and rear walls of the head-box, and having end heads in guiding engagements with the head-box walls and one of said heads having an opening in communication with the head-box relief-outlet opening, means for imparting vertical adjusting movements to said trough, a pump, a conduit, leading from the said relief-outlet thereto, and a conduit leading therefrom to the screen-box.

809,074. GARMENT-SUPPORTER. HARRY F. NILES, Chicago, Ill. Filed Dec. 21, 1904. Serial No. 237,810.



Claim.—1. A garment-supporter comprising a belt, yieldable carriers mounted thereon, garment-clasps mounted upon the carriers, and a band connecting the clasps.

2. A garment-supporter comprising a belt, yieldable carriers mounted upon the belt and being movable longitudinally and transversely thereof, garment-clasps mounted upon the carriers, a band connecting the clasps, and means for varying the length of the band.

3. A garment-supporter comprising a belt, yieldable carriers mounted thereon, garment-clasps mounted upon the carriers and each comprising a hook which may extend over the garment, a spring-tongue for engagement with the garment movable within the hook, and a band connecting the clasps below the hooks and tongues.

4. A garment-supporter comprising a belt, a supporting member mounted upon the belt, a spiral spring carried by the supporting member and being free to yield laterally, and a garment-clasp mounted upon the spring.

5. A garment-supporter comprising a belt, a slide movable upon the belt, a spiral spring carried by the slide and being free to yield laterally, and a garment-clasp mounted upon the spring.

6. A garment-supporter comprising a belt, a supporting member mounted upon the belt, a flexible member extending therefrom, a spring connected to the flexible member and extending above the belt, and a garment-clasp mounted upon the spring.

7. A garment-supporter comprising a belt, a supporting member mounted upon the belt, a flexible member extending therefrom, a spring connected to the flexible member and extending above the belt, and a garment-clasp pivoted upon the spring.

8. A garment-supporter comprising a belt, a supporting member mounted upon the belt, a flexible member extending from and being movable through the supporting member, a spring connected to the flexible member and extending above the belt, and a garment-clasp mounted upon the spring.

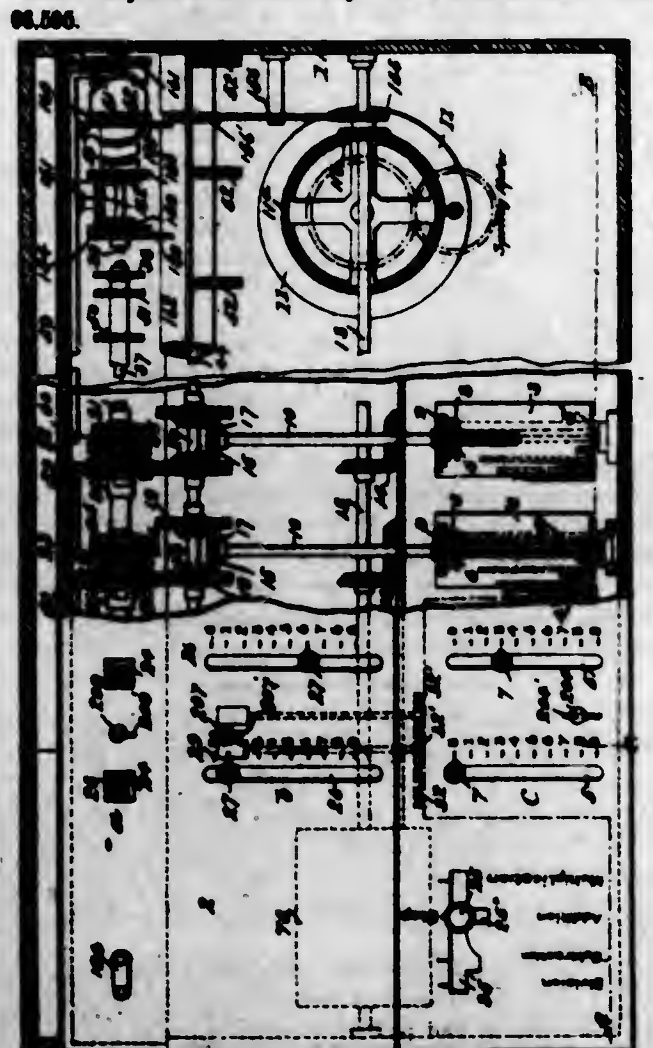
9. A garment-supporter comprising a belt, a supporting member mounted upon the belt, a flexible member extending therefrom, a generally U-shaped spring connected at its lower portion to the flexible member, and garment-clasps mounted upon each of its upper ends.

10. A garment-supporter comprising a belt, a supporting member mounted upon the belt, a flexible member extending therefrom, a generally U-shaped spiral spring connected at its lower portion to the flexible member, and garment-clasps mounted upon each of its upper ends.

11. A garment-supporter comprising a belt, a supporting member mounted upon the belt, a flexible member extending therefrom, a generally U-shaped spring connected at its lower portion to the flexible member, garment-clasps mounted upon each of its upper ends, and a band connecting the clasps.

12. A garment-supporter comprising a belt, a supporting member mounted upon the belt, a flexible member extending therefrom, a generally U-shaped spring connected at its lower portion to the flexible member, a band joining the opposite sides of the spring, and garment-clasps mounted upon each of the upper ends of the spring.

809,075. CALCULATOR. ALEXANDER RECHNITZER, Vienna, Austria-Hungary, assignor to The Keuffel & Esser Company, Hoboken, N. J., a Corporation of New Jersey. Filed June 29, 1901. Serial No. 66,596.



Claim.—1. The combination with registering devices, of operating devices, adapted when operated, automatically to move two or more of said registering devices each to an extent independently predetermined; transferring devices adapted when put into operation automatically and simultaneously to transfer the tens from all said registering devices which have reached a given position; a motor; means for connecting said motor with said operating devices and keeping the same in connection therewith until the desired operation is completed, means for automatically disconnecting said motor from said operating devices; means for automatically putting said transferring devices into operation after said disconnection of said motor from said operating devices, means for putting said motor into operation and means for automatically stopping the machine after the completion of its operation.

2. The combination with registering devices, of operating devices adapted when operated, automatically to move two or more of said registering devices, each to an extent independently predetermined; transferring devices adapted when put into operation automatically and simultaneously to transfer the tens from all said registering devices which have reached given position; a motor; means for connecting said motor with said operating devices and keeping the same in connection therewith until the said desired operation is completed; means for thereafter automatically disconnecting said motor from said operating devices, means for automatically putting said transferring devices into connection with said motor after the disconnection of said motor from said operating devices; means for putting said motor into operation, and means for automatically stopping the machine after the completion of its operation.

3. In a calculating-machine, the combination with a movable carriage containing registering devices, of means for operating the registering devices and means for preventing any movement of said carriage out of its normal position during the movement of said registering devices by said operating means.

4. In a calculating-machine, the combination of means for setting up a multiplicand of two or more digits, means for setting up a multiplier of two or more digits, numeral-wheels, means to add said multiplicand to said numeral-wheels successively a number of times corresponding to each digit of the multiplier and including a movable carriage having said numeral-wheels mounted thereon, and means for preventing movement of said carriage during any of such additions.

5. In a calculating-machine, the combination of means for setting up a divisor of two or more digits, numeral-wheels on which the dividend is set up, means to subtract said divisor from the dividend set up on said numeral-wheels successively a number of times represented by each digit of the quotient and including a movable carriage having said numeral-wheels mounted thereon, and means for preventing movement of said carriage during any of such subtractions.

6. In a calculating-machine, the combination with registering devices mounted on a movable carriage, of operating devices adapted to operate the registering devices to register either additions or subtractions dependent upon the position of said carriage with relation to the said operating means, and means for preventing movement of said carriage during such an addition or subtraction.

7. In a calculating-machine, the combination with a casing, a motor and registering devices driven by said motor, of a carriage movable independently of said motor with relation to the casing, and means for preventing any movement of said carriage during the movement of said registering devices.

8. In a calculating-machine, the combination of means for setting up a multiplicand of two or more digits, numeral-wheels, a motor, means driven by said motor to add said multiplicand to said numeral-wheels, a carriage movable independently of the motor and having the numeral-wheels mounted thereon for moving them to denominations of different order, and means for preventing any movement of the carriage during the performance of an addition.

9. In a calculating-machine, the combination of means for setting up a divisor of two or more digits, numeral-wheels on which the dividend is set up, a motor, means driven by said motor to subtract said divisor from said numeral-wheels, a carriage movable independently of the motor and having numeral-wheels mounted thereon for moving them to denominations of different order, and means for preventing any movement of the carriage during the performance of a subtraction.

10. In a calculating-machine, the combination with a casing containing operating mechanism, of a carriage movable with relation thereto, means for retaining said carriage in its position during an operation and for releasing the carriage at the end of an operation, and means coöperating with the releasing means to stop the operating mechanism during the movement of the carriage.

11. In a calculating-machine, the combination with a casing containing operating mechanism, of a carriage movable with relation thereto, means for retaining said carriage in its position during an operation and for releasing the carriage at the end of an operation, means for stopping said operating means after the end of a calculation, and means for placing the stopping means into operative position during the calculation.

12. In a calculating-machine capable of adding and subtracting, the combination of means for setting up a number of two or more digits, numeral-wheels, means to add the number set up to the numeral-wheels, a shiftable carriage having the numeral-wheels mounted thereon and means for turning said numeral-wheels in reverse direction, *i. e.*, to subtract after a shifting movement of the carriage has taken place.

13. In a calculating-machine capable of adding and subtracting, the combination of numeral-wheels, positively-operating carrying mechanism, and operating devices for adding numbers to said numeral-wheels, a shiftable carriage having said numeral-wheels mounted thereon and means for turning said numeral-wheels in reverse direction, *i. e.*, to subtract after a shifting movement of the carriage has taken place.

14. In a calculating-machine capable of multiplying and dividing, the combination of a shiftable carriage, means adapted automatically to shift the carriage, numeral-wheels mounted on the carriage, and operating devices to operate the numeral-wheels including means for reversing the rotation of the numeral-wheels after a shifting movement of carriage has taken place.

15. In a dividing-machine, the combination of means for setting up a divisor of two or more digits, a shiftable carriage, numeral-wheels on which the dividend is set up mounted on the carriage, and operating devices to operate the numeral-wheels including means for reversing the rotation of the numeral-wheels after a shifting movement of the carriage has taken place.

16. The combination, in a machine capable of adding and subtracting, of a movable carriage, a registering-wheel carried thereby, reversely-moving operating-wheels, and means for moving the carriage and thereby engaging either of the operating-wheels with the registering-wheel.

17. In a multiplying-machine, the combination of devices for setting up a multiplicand, means for indicating the position of the decimal-point in said multiplicand, devices for setting up the multiplier, means for indicating the position of the decimal-point in said multiplier and means adapted when set into operation automatically to carry out the operation of multiplication, register the result thereof and adjust said decimal-point to accord with said result.

18. In a multiplying-machine, the combination of devices for setting up a multiplicand, devices for setting up a multiplier of two or more digits, and means adapted, when put into operation, to automatically and successively add said mutiplicand a number of times corresponding with the multiplier, and to register the result thereof.

19. In a multiplying-machine, the combination with devices for setting up a multiplicand and devices for setting up a multiplier, of a movable carriage containing registering devices, means adapted when put into operation automatically to add the multiplicand a number of times to correspond with each figure of the multiplier and means for automatically moving said carriage and step by step bringing it successively into engagement with said means for causing successive additions.

20. In a dividing-machine, the combination with devices for setting up a dividend, devices for setting up a divisor and means adapted when once put into operation to automatically carry out the operation of division and register the result thereof whether the quotient comprises one or more digits.

21. In a dividing-machine, the combination with devices for setting up a dividend, devices for setting up a divisor of two or more digits, and means adapted, when once put into operation, to automatically carry out the operation of division, and register the result thereof whether the quotient comprises one or more digits.

22. In a dividing-machine, the combination of devices for setting up a dividend, means for indicating the position of a decimal-point in said dividend, devices for setting up a divisor, means for indicating the position of a decimal-point in said divisor, and means adapted when set into operation to automatically carry out the operation of division, register the result thereof and adjust said decimal-point to accord with said result.

23. In a dividing-machine, the combination of devices for setting up a dividend, devices for setting up a divisor and means adapted when once put into operation to automatically and successively subtract said divisor a number of times automatically regulated and dependent upon the dividend, and to register the result thereof.

24. In a dividing-machine, devices for setting up a dividend, de- ... left numeral-wheel during a rotation caused by the teeth on the com-

means to add the multiplicand set up to the registering-wheels a ... thereon and means adapted automatically to move and to arrest the

24. In a dividing-machine, devices for setting up a dividend, devices for setting up a divisor and arranging the same under said dividend and in parallel columns therewith starting from the left, means adapted when put into operation automatically to move the devices representing the dividend step by step and to the extent of one column thereof, means adapted automatically when put into operation to subtract the divisor from the figures of said dividend arranged in columns above said divisor until said dividend reaches zero, means for automatically registering the number of subtractions necessary to produce the above result, means adapted automatically at the end of each said result to readd to the dividend the remainder subtracted during the last said operation of subtraction and to move back the said registering devices one figure, and means for automatically stopping the machine at the end of the calculation.

25. The combination with a calculating-machine, of registering devices, means adapted to perform the calculation of addition and register the result thereof on said registering devices, and means comprising a single control-lever adapted automatically to put said machine into operation and reverse the same or cause it to perform the calculation of subtraction.

26. In a machine capable of performing the operations of addition and subtraction, the combination of means for setting up two numbers, a control-lever, and means whereby a single movement of the control-lever will adjust and release the machinery for the automatic performance of addition, or subtraction, respectively.

27. In a calculating-machine, the combination of a casing containing operating devices, a carriage containing registering devices and movable with regard to said casing, and means comprising a single control-lever adapted to change the position of said carriage with relation to said casing, and thereby causing said operating means to move said registering devices to register the result of the calculation of either addition or subtraction, depending upon the relative position of said carriage with reference to said casing.

28. The combination with registering devices, of operating means for simultaneously moving two or more of the same and transferring means for afterward simultaneously and positively transferring from a lower to a higher denomination.

29. The combination with registering devices, of operating means for simultaneously moving two or more of the same, and transferring means for afterward simultaneously transferring from a lower to a higher denomination from all of said registering devices, which either have reached a given position, when having been turned by the operating means, or are reaching this given position during the turning by the transferring means.

30. The combination with registering devices adapted by reverse movements of the same device to register additions and subtractions, of operating means for simultaneously moving two or more of the same and transferring means for simultaneously transferring from a lower to higher denomination.

31. The combination with registering devices adapted by reverse movements of the same device to register additions and subtractions, of operating means for simultaneously moving two or more of the same, and transferring means for simultaneously and positively transferring from a lower to a higher denomination.

32. The combination with registering devices adapted to register additions and subtractions, of operating means for simultaneously moving two or more of the same, and transferring means for simultaneously and positively transferring from a lower to a higher denomination from all of said registering devices, which either have reached a given position, when having been turned by the operating means, or are reaching this given position, during the turning by the transferring means.

33. In a calculating-machine, the combination with registering devices, of operating means for moving the same, carrying means actuated when one of the registering devices has reached a given position, and adapted to produce a further movement of the next registering device after the operating means have ceased to move, and means for producing a change of the registering mechanism during the transferring from a lower to a higher denomination, whereby a simultaneous movement of two or more registering devices will take place when one of them has reached a given position.

34. A transferring mechanism for calculating-machines, comprising a plurality of numeral-wheels each provided with a single tooth, a plurality of other wheels having single teeth mounted on a common shaft and rotating with the same, means actuated by the single teeth of the numeral-wheels, to cause connections between the numeral-wheels and the teeth rotating with the common shaft, so that these teeth can rotate the wheels, and means adapted to enable the single teeth of each numeral-wheel directly to rotate the next left numeral-wheel, during a rotation caused by the teeth on the common shaft.

35. In a calculating-machine, a plurality of numeral-wheels loosely mounted on a common shaft, a gear for each numeral-wheel, and a sliding bar movable parallel to the shaft and carrying a series of stops adapted to engage in the teeth of the gears and to stop the same either at the same time or successively dependent upon the arrangement of the stops.

36. The combination in a calculating-machine, of a plurality of numeral-wheels provided with cogs and geared together, one after the other for simultaneous movement, with means for correcting the play of the gears by adjusting them one after the other.

37. The combination, in a calculating-machine, of a plurality of numeral-wheels provided with cogs and geared together, one after the other for simultaneous movement, with means for positively correcting the play of the gears by adjusting them, one after the other, in a forward direction.

38. In an adding and subtracting machine, the combination with registering devices, of operating means for the same comprising two gears continuously operated in opposite directions and adapted for alternately engaging the same registering device for addition or subtraction respectively.

39. In a calculating-machine, means for operating the registering devices comprising a plurality of pairs of gears, the shafts of all the gears being in one line, and each pair connected with one of the operating means, and turned by them in opposite directions.

40. The combination, in a machine for simultaneously adding numbers of two or more digits, with operating means of registering devices, one means bodily movable with respect to the others, and adapted to register additions and subtractions, means for transferring the tens in additions and subtractions and means for putting said transferring devices into operation either for additions or subtractions dependent upon the position of the operation means with relation to the registering devices.

41. In a calculating-machine capable of performing additions and subtractions, the combination with a casing, of a carriage movable with regard thereto, a row of stops adjusting the carriage when additions are performed, and another row of stops adjusting the carriage when subtractions are performed.

42. In a calculating-machine, the combination of a casing, with a carriage, means adapted when put into operation to perform either additions or subtractions dependent upon the position of the carriage with regard to the casing, a yoke swinging upon its axis and means adapted to determine the position of the carriage by the different positions of the yoke.

43. In a machine capable of performing the operations of multiplying and dividing, the combination with a casing and a carriage movable with relation thereto, of stops for adjusting the carriage, and means adapted to render a part of the stops ineffective.

44. In a calculating-machine, the combination with a casing, of a carriage movable with relation thereto, two rows of stops for adjusting the carriage, one row being for addition and the other for subtraction, and means for rendering part of the stops ineffective.

45. In a calculating-machine, the combination of a motor, calculating mechanism driven by the motor, means for stopping the motor, and means for releasing the motor for a single operation, or a plurality thereof, as may be desired.

46. In a multiplying-machine, the combination of means for setting up a multiplicand of two or more digits, registering-wheels, means to add the multiplicand set up to the registering-wheels a number of times corresponding to each digit of the multiplier and including a carriage having the registering-wheels mounted thereon, means for moving the carriage in one direction and means for preventing such motion.

47. In a multiplying-machine, the combination of means for setting up a multiplicand of two or more digits, registering-wheels, means to add the multiplicand set up to the registering-wheels and including a carriage having the registering-wheels mounted thereon, means for preventing movement of the carriage until it has to be moved and means for then releasing the carriage automatically.

48. In a multiplying-machine, the combination of means for setting up a multiplicand of two or more digits, registering-wheels, means to add the multiplicand set up to the registering-wheels a number of times corresponding to each digit of the multiplier and including a carriage having the registering-wheels mounted thereon, and means adapted automatically to move the carriage during the performance of multiplication.

49. In a multiplying-machine, the combination of means for setting up a multiplicand of two or more digits, registering-wheels, means to add the multiplicand set up to the registering-wheels a number of times corresponding to each digit of the multiplier and including a carriage having the registering-wheels mounted thereon, and means adapted automatically to move and to arrest the carriage during the performance of multiplication.

50. In a multiplying-machine, the combination of means for setting up a multiplier, means for setting up a multiplicand, numeral-wheels, means to perform the multiplication with one digit of the multiplier and to register it on the numeral-wheels, a carriage having the numeral-wheels mounted thereon, means for moving the carriage and means controlled by the setting-up devices of the multiplier for retaining the carriage in its position until the completion of each digit operation and for releasing the carriage at the end of such operation.

51. In a multiplying-machine, the combination of means for setting up a multiplier, means for setting up a multiplicand, numeral-wheels, means to perform the multiplication with one digit of the multiplier and to register it on the numeral-wheels, a carriage having the numeral-wheels mounted thereon, means for moving the carriage and means controlled by the setting-up devices of the multiplier for stopping the carriage at the proper digit for operation.

52. In a multiplying-machine, the combination with a casing, of a carriage movable with relation thereto, devices on the carriage for setting up a multiplier of two or more digits by moving these devices out of their initial positions, operating means in the casing to return the said setting-up devices to their initial positions during a calculation, and means in the casing for stopping the operating devices when the setting-up devices have reached their initial positions.

53. In a multiplying-machine, the combination with a casing, of a carriage movable with relation thereto, devices on the carriage for setting up a multiplier by moving these devices out of their initial positions, operating means in the casing to return said setting-up devices to their initial position during an operation, and means for releasing the carriage when one of the setting-up devices reaches its initial position.

54. In a multiplying-machine, the combination of means for setting up a multiplicand, means for setting up a multiplier, and means adapted after having been released, to automatically perform the operation of multiplication, and to register the result thereof.

55. In a multiplying-machine, the combination of means for setting up a multiplicand, means for setting up a multiplier of two or more digits, and means adapted when put into operation automatically to perform the operation of multiplication and to register the result thereof.

56. In a multiplying-machine performing multiplication by repeated additions, the combination of means for setting up a multiplicand, means for setting up a multiplier of two or more digits, and means automatically to regulate the number of additions in accordance with the multiplier set up.

57. In a calculating-machine, the combination with a casing, and a carriage movable with relation thereto, of means mounted on the carriage for registering the number of additions or subtractions by their forward or backward movement, respectively, dependent upon the position of the carriage with relation to the casing.

58. In a dividing-machine, the combination of means for setting up a divisor of two or more digits, numeral-wheels on which the dividend is set up, means to subtract the divisor set up from the numeral-wheels a number of times dependent upon each digit of the quotient, including a carriage having the numeral-wheels mounted thereon, means for moving the carriage in one direction and means for preventing such motion.

59. In a dividing-machine, the combination of means for setting up a divisor of two or more digits, numeral-wheels on which the dividend is set up, means to subtract the divisor set up from the numeral-wheels, including a carriage having the numeral-wheels mounted thereon, means for preventing movement of the carriage until it has to be moved and for releasing the carriage automatically at such moment.

60. In a dividing-machine, the combination of means for setting up a divisor of two or more digits, numeral-wheels on which the dividend is set up, means to subtract the divisor set up from the numeral-wheels a number of times dependent upon each digit of the quotient, including a carriage having the numeral-wheels mounted thereon and means adapted automatically to move the carriage during the performance of division.

61. In a dividing-machine, the combination of means for setting up a divisor of two or more digits, numeral-wheels on which the dividend is set up, means to subtract the divisor set up from the numeral-wheels a number of times dependent upon each digit of the quotient, including a carriage having the numeral-wheels mounted thereon and means adapted automatically to move and to arrest the carriage during the performance of division.

62. In a calculating-machine, the combination with registering mechanism, capable of performing addition and subtraction, comprising numeral-disks, of transferring mechanism, and means connected with the numeral-disk of higher order for changing the operation from subtraction to addition.

63. In a calculating-machine, the combination with registering mechanism, capable of performing addition and subtraction, of transferring mechanism and mechanism substituted for the carrying mechanism of higher order for changing the operation from subtraction to addition.

64. In a dividing-machine, the combination with registering devices capable of performing addition and subtraction, of means for changing the action of the machine from adding to subtracting or from subtracting to adding if one of the registering devices passes a given position.

65. In a dividing-machine, the combination of a casing, with a carriage movable with respect thereto, registering devices, and means adapted to cause a movement of the carriage if one of the registering devices passes a given position.

66. In a dividing-machine, the combination of a casing, with a carriage movable with respect thereto, means preventing a movement of the carriage, registering devices, and means adapted automatically to release the carriage if one of the registering devices passes a given position.

67. In a calculating-machine, means for performing division including a casing with a carriage movable with respect thereto, and means adapted automatically to cause a movement of the carriage, if the machine indicates too great a quotient.

68. In a calculating-machine, means for performing division including means to try a quotient and means adapted to automatically correct the error if the machine tries too great a quotient.

69. In a calculating-machine, means for performing division including means to try a quotient, means adapted to correct the error if the machine tries too great a quotient, and means adapted automatically to adjust the machine for the continuation of the calculation on the next lower digit, after the error has been corrected.

70. In a calculating-machine, the combination with registering-wheels, of operating devices for moving the same, a movable carriage having the registering-wheels mounted thereon, and means for preventing movement of the operating devices during the movement of the carriage.

71. In a calculating-machine, the combination of means for setting up a multiplicand, means for setting up a multiplier of two or more digits, registering-wheels, operating devices for moving the same, a movable carriage having the registering devices mounted thereon, and means for preventing any movement of the operating devices during the movement of the carriage.

72. In a calculating-machine, the combination with registering-wheels, of operating devices for moving the same, a movable carriage having the registering devices mounted thereon, means for retaining the carriage in its position during the movement of the operating means, and for releasing the carriage at the end of such movement, and means for preventing any movement of the operating devices during the movement of the carriage.

73. In a calculating-machine, the combination with means for performing multiplication by repeated additions including registering devices, of a motor for actuating such means, means for stopping the motor after an addition, and means for releasing said stopping devices during an addition.

74. In a calculating-machine, the combination with means for performing division by repeated subtractions including registering devices, of a motor for actuating such means, means for stopping the motor after a subtraction and means for releasing said stopping devices during a subtraction.

75. In a calculating-machine, the combination with devices for the setting up of the decimal-point, one of them provided for each digit of the multiplicand or divisor, and each of them capable of an independent movement, of means for imparting to these devices another common movement.

76. The combination, in a calculating-machine, of means for setting up the decimal-point in the dividend, means for setting up the decimal-point in the divisor, and means adapted when put into operation automatically to indicate the place of the decimal-point in the quotient.

77. The combination, in a calculating-machine, of devices adapted when put into operation to perform the calculation of either addition or subtraction or multiplication or division, and to register

the result of each of said calculations, and means, comprising a single control-lever, adapted at will to put said machine into operation for the automatic performance of any one of said calculations.

78. The combination, in a calculating-machine, with means for setting up two figures, of devices adapted when put into operation automatically to perform the calculation of either addition or subtraction or multiplication or division with the figures set up, and to register the result of each of said calculations, automatically indicating the decimal-point in the product or quotient.

79. In a calculating-machine, the combination with means for registering a multiplier or quotient of two or more digits, of a motor, operating devices driven by the motor, stopping devices to stop the operating devices at the end of the operation, means for placing said stopping devices in operative position during the operation, and means for engaging said stopping devices at the end of the operation, if in operative position.

80. In a multiplying-machine, the combination of means for setting up a multiplicand, means for setting up a multiplier, means for performing the multiplication, a control-lever, means to stop the machine and means to adjust and release the machine for multiplication by a single movement of the control-lever.

81. In a dividing-machine, the combination of means for setting up a divisor, means for setting up a dividend, means for performing the division, a control-lever, means to stop the machine and means to adjust and release the machine for division by a single movement of the control-lever.

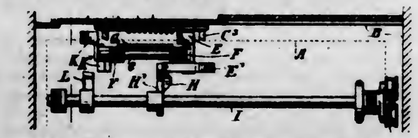
82. The combination, in a calculating-machine, of means for setting up a multiplicand and a multiplier means for setting up a decimal-point in one of the same, means for performing the multiplication and indicating the product, and means adapted when put into operation to automatically indicate the place of the decimal-point in the product.

83. The combination, in a calculating-machine, of means for setting up a multiplicand and a multiplier, means for setting up a decimal-point in both multiplicand and multiplier, means for performing the multiplication and indicating the product, and means adapted when put into operation to automatically indicate the place of the decimal-point in the product.

84. In a dividing-machine the combination with devices for setting up a divisor, devices for setting up a dividend which contains said divisor more than ten times, and means adapted when once put into operation to automatically carry out the operation of division and indicate the correct quotient.

85. In a dividing-machine the combination with devices for setting up a divisor, devices for setting up a dividend which contains said divisor more than ten times and means adapted when once put into operation to automatically carry out the operation of division and indicate the correct quotient comprising means for performing division corresponding to one figure of the quotient and automatically afterward performing division corresponding to the other figure of the quotient.

809,076. SAFETY DEVICE FOR ELEVATORS. ISAAC B. RITTER, Philadelphia, Pa. Filed July 15, 1905. Serial No. 269,788.



Claim.—1. The combination of an elevator-car, a door, a projection upon said door, a bell-crank lever pivoted to the hatchway and adapted to engage said projection, a lever pivoted to said hatchway adapted to be engaged by said projection when the door is closed, a cam-shoe upon said car adapted to engage said bell-crank lever and unlock the door, a cam-plate upon said car to be engaged by said lever when the door is open and means controlled by said cam-plate to lock the car, substantially as described.

2. The combination of an elevator-car, a door, a projection upon said door, a bell-crank lever to engage said projection, a lever adapted to be held out of action by said projection when said door is closed, a bearing on said car, a cam-shoe slidably mounted in said bearing, means for throwing said cam-shoe into engagement with said bell-crank lever, a cam-plate slidably mounted in said bearing adapted to be acted upon by said lever when said door is open and lock the car, substantially as described.

3. The combination of an elevator-car, a door, a projection upon said door, a bell-crank lever to engage said projection, a lever adapted to be held out of action by said projection, a bearing upon said car, a cam-shoe slidably mounted in said bearing, a rock-shaft, a cam upon the same adapted to throw said cam-shoe into engagement with said bell-crank lever and release said door, a cam-plate slidably mounted in said bearing adapted to be acted upon by said lever when the door is open, an arm on said rock-shaft to be engaged by said cam-plate and means for operating said rock-shaft in conjunction with the mechanism for starting and stopping the car, substantially as described.

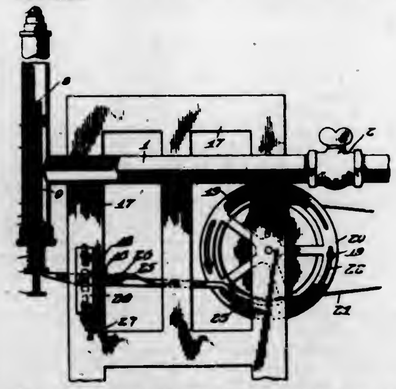
4. The combination of an elevator-car, a rock-shaft to control said car, a cam on said rock-shaft, a roller, a cam-shoe carrying said roller, a bearing, an arm on said rock-shaft, a block to engage said arm, a cam-plate carrying said block, a spring between said cam-plate and said cam-shoe, and levers upon the hatchway to coact with said cam-plate and said cam-shoe, substantially as described.

5. The combination of an elevator-car, a rock-shaft to control said car, a cam on said rock-shaft, a roller, a cam-shoe, rods carrying said cam-shoe, bearings in which said rods are mounted, a spring, a bell-crank lever on the hatchway, a projection on the same to be engaged by said cam-shoe, and a door having a projection thereon, adapted to be engaged by said bell-crank lever, substantially as described.

6. The combination of an elevator-car, a rock-shaft, an arm on the same, a block having a recess formed therein, a cam-plate carrying said block, rods carrying said cam-plate, bearings in which said rods are mounted, a lever pivoted to the wall of the hatchway, a door, a projection upon the door to hold said lever out of action, and a projection upon the said lever to engage said cam-plate when the door is opened, substantially as described.

7. The combination of an elevator-car, a door, a projection on said door, said projection having a plurality of notches formed therein, a bell-crank lever, a projection on the same, a lever engaged by the said projection upon the door, a spring, a projection on said lever, and means upon the car to control said bell-crank lever and release the door and to lock the car when acted upon by the said lever controlled by the projection on the door, substantially as described.

809,077. GAS-CONTROLLER FOR FLASH-LIGHTS AND THE LIKE. ROBERT C. ROSEL, Chicago, Ill. Filed Mar. 6, 1906. Serial No. 305,622.



Claim.—1. A device of the kind described, comprising a tube, a valve controlling the opening in said tube, and projecting therefrom, and means for connecting said tube in the supply-pipe to a gas-light, in combination with a rotatable wheel and means operated by said wheel for engaging the projecting portion of said valve to operate the same to control the supply of gas to said light, and means for rotating said wheel.

2. A device of the kind described, comprising a tube, a valve controlling the opening in said tube and projecting therefrom, and means for connecting said tube in the supply-pipe to a gas-light, in combination with a lever arranged to engage the projecting portion of said valve to operate the same, a rotatable wheel provided with means for periodically engaging said lever, and means for rotating said wheel.

3. A device of the kind described, comprising a tube, a valve controlling the opening in said tube, and means for connecting said tube in the supply-pipe to a gas-light, in combination with a lever

adapted to operate said valve, a curved extension formed upon one end of said lever, and a rotatable wheel provided with means for periodically engaging said lever near said extension to operate said valve, and means for rotating said wheel.

4. A device of the kind described, comprising a tube, a valve controlling the opening in said tube, and means for connecting said tube in the supply-pipe to a gas-light, in combination with a lever arranged to operate said valve, a rotatable wheel provided with means for periodically engaging said lever to operate said valve, means for rotating said wheel, and means for adjusting the pivotal support of said lever to control the operation of said valve.

5. A device of the kind described, comprising a tube, a valve controlling the opening in said tube, and means for connecting said tube in the supply-pipe to a gas-light, in combination with a two-part lever arranged to operate said valve, the parts of said lever being pivotally connected, a stop to limit the relative movement of the lever parts and a spring tending to normally hold said movable part against said stop, a rotatable wheel provided with means for periodically engaging said lever to operate said valve, and means for rotating said wheel.

6. A device of the kind described, comprising a tube, a valve controlling the opening in said tube, and means for connecting said tube in the supply-pipe to a gas-light, in combination with a lever adapted to operate said valve, a curved extension formed upon one end of said lever, a rotatable wheel provided with means for periodically engaging said lever near said extension to operate said valve, means for rotating said wheel, and means for adjusting the pivotal support of said lever to control the operation of said valve.

7. A device of the kind described, comprising a tube, a valve controlling the opening in said tube, and means for connecting said tube in the supply-pipe to a gas-light, in combination with a two-part lever arranged to operate said valve, the parts of said lever being pivotally connected, a stop to limit the relative movement of said lever parts in one direction, a spring tending to normally hold said movable part against said stop, and a curved extension formed at one end of said lever, a rotatable wheel provided with means for periodically engaging said lever near said extension to operate said valve, and means for rotating said wheel.

8. A device of the kind described, comprising a tube, a valve controlling the opening in said tube, and means for connecting said tube in the supply-pipe to a gas-light, in combination with a two-part lever arranged to operate said valve, the parts of said lever being pivotally connected, a stop to limit the relative movement of said lever parts in one direction, a spring tending to normally hold said movable part against said stop, and a curved extension formed upon one end of said lever a rotatable wheel provided with means for periodically engaging said lever near said extension to operate said valve, means for rotating said wheel, and means for adjusting the pivotal support of said lever to control the operation of said valve.

9. A device of the kind described, comprising a tube, a valve, resiliently maintained at one limit of its movement, controlling the opening in said tube and means for connecting said tube in the supply-pipe to a gas-light, in combination with a lever arranged to move said valve to the opposite limit of its movement, a rotatable wheel provided with means for periodically engaging said lever to operate said valve, and means for rotating said wheel.

10. A device of the kind described, comprising a tube, a valve resiliently maintained at one limit of its movement, controlling the opening in said tube, and means for connecting said tube in a supply-pipe to a gas-light, in combination with a lever arranged to move said valve to the opposite limit of its movement, a curved extension formed upon one end of said lever, and a rotatable wheel provided with means for periodically engaging said lever near said extension to operate said valve, and means for rotating said wheel.

11. A device of the kind described, comprising a tube, a valve controlling the opening in said tube, a spring arranged to normally hold said valve open, and means for connecting said tube in the supply-pipe to a gas-light, in combination with a lever arranged to close said valve, a rotatable wheel provided with means for periodically engaging said valve to operate said valve, and means for rotating said wheel.

12. A device of the kind described, comprising a tube, a valve controlling the opening in said tube and projecting laterally therefrom, and means for connecting said tube in the supply-pipe of a gas-light, in combination with a lever arranged to engage said projecting part to operate said valve, a rotatable wheel provided with laterally-projecting pins in its rim for periodically engaging said lever, to operate said valve, and means for rotating said wheel.

13. A device of the kind described, comprising a tube, a valve controlling the opening in said tube, and means for connecting said tube in the supply-pipe to a gas-light, in combination with a lever arranged to operate said valve, a rotatable wheel having concentric slots formed in its rim, laterally-projecting pins adjustably positioned in said slot for periodically engaging said lever to operate said valve, and means for rotating said wheel.

14. A device of the kind described, comprising a tube, a valve controlling the opening in said tube, and means for connecting said tube in the supply-pipe to a gas-light, in combination with a lever adapted to operate said valve, a curved extension formed upon one end of said lever, a rotatable wheel having concentric slots formed in its rim, laterally-projecting pins adjustably positioned in said slots for periodically engaging said lever near said extension to operate said valve, and means for rotating said wheel.

15. A device of the kind described, comprising a tube, a valve controlling the opening in said tube, and means for connecting said tube in the supply-pipe to a gas-light, in combination with a lever arranged to operate said valve, a rotatable wheel having concentric slots formed in its rim, laterally-projecting pins adjustably positioned in said slots for periodically engaging said lever to operate said valve, and means for rotating said wheel, and means for adjusting the pivotal support of said lever to control the operation of said valve.

16. A device of the kind described, comprising a tube, a valve controlling the opening in said tube, and means for connecting said tube in the supply-pipe to a gas-light, in combination with a two-part lever arranged to operate said valve, the parts of said lever being pivotally connected, a stop to limit the relative movement of the lever parts, and a spring tending to normally hold said movable parts against said stop, a rotatable wheel having concentric slots in its rim, and laterally-projecting pins adjustably positioned within said slots for periodically engaging said lever to operate said valve, and means for rotating said wheel.

17. A device of the kind described, comprising a tube, a valve projecting longitudinally from said tube and controlling the opening therein, a by-pass arranged to permit the passage of gas by said valve, means to control the passage through said by-pass, and means for connecting said tube in the supply-pipe of a gas-light, in combination with a rotatable wheel and means operated by said wheel for engaging said projecting part to operate said valve to control the supply of said gas to said light.

18. A device of the kind described, comprising a tube, a valve controlling the opening in said tube, a by-pass arranged to permit the passage of gas by said valve, means to control the passage through said by-pass, and means for connecting said tube in the supply-pipe to a gas-light, in combination with a lever arranged to operate said valve, a rotatable wheel provided with means for periodically engaging said lever to operate said valve, means for rotating said wheel and means for adjusting the pivotal support of said lever to control the operation of said valve.

19. A device of the kind described, comprising a tube, a valve controlling the opening in said tube, a by-pass arranged to permit the passage of gas by said valve, means to control the passage through said by-pass, and means for connecting said tube in the supply-pipe to a gas-light, in combination with a two-part lever arranged to operate said valve, the parts of said lever being pivotally connected, a stop to limit the relative movement of the lever parts and a spring tending to normally hold said movable part in contact with said stop, a rotatable wheel provided with means for periodically engaging said lever to operate said valve, and means for rotating said wheel.

20. A device of the kind described, comprising a tube, a valve controlling the opening in said tube, a by-pass arranged to permit the passage of gas by said valve means to control the passage of gas through said by-pass, and means for connecting said tube in the supply-pipe to a gas-light, in combination with a lever adapted to operate said valve, a curved extension formed upon one end of said lever, a rotatable wheel provided with means for periodically engaging said lever near said extension to operate said valve, means for rotating said wheel, and means for adjusting the pivotal support of said lever to control the operation of said valve.

21. A device of the kind described, comprising a tube, a valve controlling the opening in said tube, a by-pass arranged to permit the passage of gas by said valve, means to control the passage through said valve, and means for connecting said tube in the supply-pipe to a gas-light, in combination with a lever adapted to operate said valve, a curved extension formed upon one end of said lever, a rotatable wheel provided with means for periodically engaging said lever near said extension to operate said valve, means for rotating said wheel,

and means for adjusting the pivotal support of said lever to control the operation of said valve.

22. A device of the kind described, comprising a tube, a valve for controlling the opening in said tube, a by-pass arranged to permit the passage of gas by said valve, means to control the passage through said by-pass, and means for connecting said tube in the supply-pipe to a gas-light, in combination with a lever arranged to operate said valve, a rotatable wheel having concentric slots formed in its rim, and laterally-projecting pins adjustably positioned in said slots, for periodically engaging said lever to operate said valve, and means for rotating said wheel.

23. A device of the kind described, comprising a tube, a valve controlling the opening in said tube, a spring arranged to normally hold said valve open, a by-pass arranged to permit the passage of gas by said valve, means to control the passage through said by-pass, and means for connecting said tube in the supply-pipe to a gas-light, in combination with a lever arranged to close said valve, a rotatable wheel provided with concentric slots in its rim, and laterally-projecting pins adjustably positioned within said slots for periodically engaging said lever to operate said valve, means for rotating said wheel and means for adjusting the pivotal support of said lever to control the operation of said valve.

24. A device of the kind described, comprising a tube, a valve controlling the opening in said tube, a spring to normally hold said valve open, a by-pass arranged to permit the passage of gas by said valve, means to control the passage through said by-pass, and means for connecting said tube in the supply-pipe to a gas-light, in combination with a two-part lever arranged to close said valve, the parts of said lever being pivotally connected, a stop to limit the relative movement of said parts in one direction, a spring tending to normally hold said movable part against said stop, and a curved extension formed at one end of said lever, a rotatable wheel provided with concentric slots in its rim, and laterally-projecting pins adjustably positioned in said slots for periodically engaging said lever near said extension to operate said valve, means for rotating said wheel, and means for adjusting the pivotal support of said lever to control the operation of said valve.

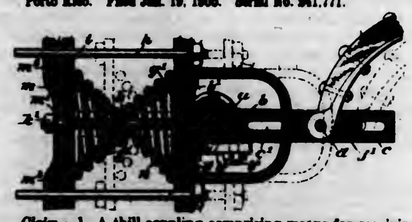
809,078. **ADJUSTABLE LEG FOR BILLIARD-TABLES.** CHARLES D. SEYMOUR, Rensselaer, N. Y. Filed Nov. 13, 1904. Serial No. 232,310.

Claim.—1. The combination with a billiard-table leg having a longitudinal bore in three diameters forming three chambers, and a transverse bore intersecting the intermediate chamber, of a block fitting in the intermediate chamber of the leg and provided at its upper end with a chamber having registering openings in its side walls, said block being also provided with a vertical opening leading out through the ends thereof, the lower end of the opening being threaded, a vertical shaft extending through the vertical opening of the block into the uppermost chamber of the leg, the lower end of the shaft being threaded and terminating in a head, a worm-wheel splined to the shaft in the chamber of the block, a casing mounted to turn on the head of the shaft in the lowermost chamber of the leg, a block fitting in the said lowermost chamber of the leg and secured to the bottom of the casing, and a horizontal shaft mounted in the horizontal bore of the leg and extending through the chamber of the said block, said shaft having a polygonal outer end and provided within the chamber of the block with a worm meshing with the worm-wheel on the vertical shaft, substantially as herein shown and described.

2. The combination with a table-leg having three vertical communicating chambers of different diameters, and a transverse chamber intersecting the intermediate vertical chamber, of a block fitting in the said intermediate vertical chamber of the leg and provided with a chamber having registering openings in its side walls, the said block being also provided with a vertical opening extending through the ends thereof, the lower end of said opening being threaded, a vertical shaft having its lower end threaded and working in the vertical opening of the block with its upper end extending into the uppermost chamber of the leg, a worm-wheel splined to the shaft in the chamber of the block, a block mounted to turn on the lower end of the shaft in the lowermost chamber of the leg, and a horizontal worm-shaft mounted in the transverse chamber of the leg, said worm-shaft extending through the chamber of the said block and having an outer polygonal end, substantially as described.

3. The combination with a table-leg provided with a longitudinal bore, the lower end of which is enlarged, and with a transverse bore intersecting the longitudinal bore, of a block having a chamber with apertured side walls, and a longitudinal opening leading through the ends of the block, the lower end of the opening being threaded, a vertical shaft extending through the longitudinal opening of the block and having its lower end threaded, a worm-wheel mounted on the shaft within the chamber of the block to slide on the shaft but to turn therewith, a block in the lower enlarged end of the bore of the leg and mounted to turn on the lower end of the said shaft, and a worm-shaft mounted in the transverse bore of the leg, said shaft extending through the chamber of said block and having a polygonal outer end.

809,079. **THILL-COUPLING.** CARLOS VIVES-NAVARRO, Ponce, Porto Rico. Filed Jan. 19, 1905. Serial No. 241,771.



Claim.—1. A thill-coupling comprising means for receiving a thill or the like, means for guiding the thill to move rectilinearly, and yielding means for resisting motion of the thill in both directions.

2. A thill-coupling, comprising a guide, a yoke adapted to be guided thereby and to receive a thill or the like, yielding means for resisting a forward pull on the thill, and yielding means for resisting a backward thrust on the thill.

3. A thill-coupling, comprising a frame adapted to be attached to the axle or frame of a vehicle, guides connected with said frame, a yoke adapted to be connected with the thills or tongue of the vehicle and provided with means by which its motion is controlled by said guides, and means for resisting motion of the yoke in both directions.

4. The combination of a frame adapted to be secured to a portion of a vehicle and having guides thereon, a yoke movably mounted with respect to said frame, a pin connected with said yoke and provided with means for engaging said guides, said yoke being provided with feet, a rod passing freely through each of said feet, means connected with the rods for preventing their motion past the feet in one direction, and yielding means for resisting motion of the rods in either direction with respect to the frame.

5. The combination of a movable yoke having feet provided with perforations, a plurality of rods one mounted to move in each of said perforations, a nut upon each of said rods adapted to engage said feet, a disk provided with perforations for receiving said rods and mounted adjacent to said feet, a second disk similarly formed and spaced from the first disk, and a spring located between said disks.

6. The combination of a movable yoke having feet provided with perforations, a plurality of rods one mounted to move in each of said perforations, a nut upon each of said rods adapted to engage said feet, a disk provided with perforations for receiving said rods and mounted adjacent to said feet, a second disk similarly formed and spaced from the first disk, a spring located between said disks, a stationary frame on the outside of one of said disks, a plate on the outside of the other disk and connected with said frame, and means for preventing the rods from moving beyond said plate in one direction.

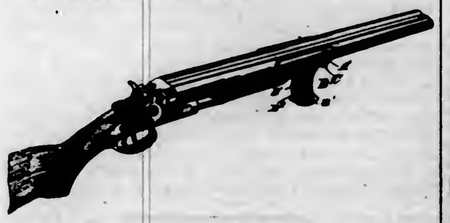
7. The combination of a movable yoke having feet provided with perforations, a plurality of rods one mounted to move in each of said perforations, a nut upon each of said rods adapted to engage said feet, a disk provided with perforations for receiving said rods and mounted adjacent to said feet, a second disk similarly formed and spaced from the first disk, a spring located between said disks, a stationary frame on the outside of one of said disks, a plate on the outside of the other disk and connected with said frame, means for preventing the rods from moving beyond said plate in one direction, means on the frame for guiding said disks in a straight line, and a projection on the frame for guiding the yoke in a line parallel to that in which the disks are guided.

8. The combination of a frame adapted to be secured to a portion of a vehicle and having guides thereon, a yoke movably mounted with respect to said frame, a pin connected with said yoke and provided with means for engaging said guides, and yielding means for resisting motion of the yoke in both directions with respect to the frame.

9. The combination of a frame adapted to be secured to a portion of a vehicle, a yoke movably mounted with respect to said frame, a rod passing freely through said yoke, means connected with the rod for preventing its motion past the yoke in one direction, and yielding means for resisting motion of the yoke in both directions with respect to the frame.

10. The combination of a movable yoke provided with perforations, a plurality of rods one mounted to move in each of said perforations, a nut upon each of said rods adapted to engage said yoke, a disk provided with perforations for receiving said rods and mounted adjacent to said yoke, a second disk spaced from the first disk, a spring located between said disks, a frame on one of said disks, a plate on the other disk and connected with the frame, and means for preventing the rods from moving beyond said plate in one direction.

809,080. **GUN ATTACHMENT.** ALFRED T. WIGHT, Rexton, Tex. Filed Mar. 20, 1905. Serial No. 250,966.

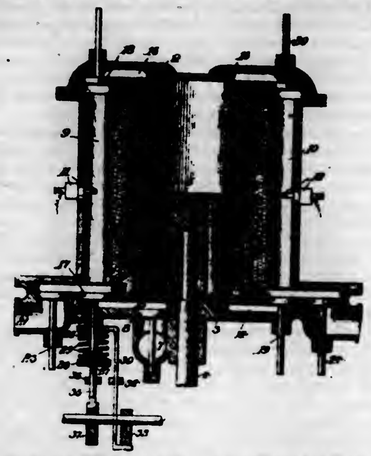


Claim.—1. The improved handle for guns herein described, comprising the spring-clasp having the opposite body-sections carved in cross-section to conform to a gun-barrel, and tapering longitudinally from end to end, the shank-plates depending from the inner edges of the opposite clasp-sections, the handle-section between the said shank-plates, the handle-sections fitting against the outer sides of the shank-plates, means for securing the handle-sections and the shank-plates together, and a clamping-screw connecting the opposite clasp-sections and adapted to bind the same securely upon the barrel, substantially as set forth.

2. The improved handle-attachment for guns, comprising a tapered spring-clasp formed of two elongated body-sections curved transversely and formed of spring metal and arranged opposite and inclined toward each other longitudinally, or from rear end to front end, and provided with pendent plates and means for securing them together to form a handle portion, as shown and described.

809,081. **INTERNAL-COMBUSTION ENGINE.** STUART S. WILLIAMS, Chicago, Ill. Filed Sept. 2, 1903. Serial No. 171,703.

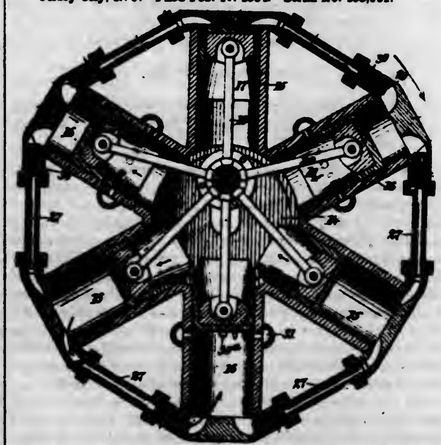
Claim.—1. In an internal-combustion engine, the combination of a cylinder having a piston, a plurality of ignition-chambers each communicating with both ends of the cylinder, and valves controlling the communications of the chambers with the cylinder.



2. In an internal-combustion engine, the combination of a cylinder having a piston, a plurality of ignition-chambers, ports leading from both ends of the cylinder to each chamber, valves normally closing the ports, and means to unseat the valves to open the ports.

3. In an internal-combustion engine, the combination of a cylinder having a piston, a plurality of ignition-chambers, ports leading from both ends of the cylinder to each chamber, an exhaust-passage for each chamber, a valve for each passage, valves for the ports, and means to unseat the valves.

809,082. **INTERNAL-COMBUSTION ENGINE.** THOS. WRIGHT, Jersey City, N. J. Filed Feb. 17, 1904. Serial No. 193,961.



Claim.—1. In an internal-combustion engine, the combination of a plurality of working cylinders, a plurality of pump-cylinders arranged alternately with respect to the working cylinders, a crank-shaft common to all of the cylinders, means for supporting all of the cylinders to turn around the center of said shaft, pistons operating in the cylinders, connections between the pistons and the crank, means controlling fluid movement between the various cylinders, said means comprising connections between the pump-cylinders and the two working cylinders adjacent thereto, and valves controlling said connections and seating against pressure in the working cylinders.

2. In an internal-combustion engine, the combination of a plu-

rality of working cylinders, a plurality of pump-cylinders arranged alternately with respect to the working cylinders, a crank-shaft common to all of the cylinders, means for supporting the cylinders to turn around the center of the shaft, pistons operating in the cylinders, connections between the pistons and the crank, means for controlling fluid movement to and from the cylinders, said means including exhaust-ports in the working cylinders at the limit of the working stroke of their pistons, connections extending from the heads of the pump-cylinders to the heads of the working cylinders at each side of the pump-cylinders, and valves controlling said connections and seating against pressure within the working cylinders.

3. In an internal-combustion engine, the combination of a working cylinder, a pump-cylinder arranged at each side thereof, a crank-shaft common to the cylinders, means for supporting the cylinders to turn around the center of the crank-shaft, pistons operating in the cylinders, connections between the pistons and crank-shaft, means controlling fluid movement in the cylinders, said means including connections between the outer ends of the pump-cylinders and the outer end of the working cylinder, valves in said connections seating against pressure in the working cylinders, and an exhaust-port in the working cylinder at the end of the expansion-stroke of the piston

4. In an internal-combustion engine, the combination of a plurality of working cylinders and an equal number of pump-cylinders respectively arranged between the working cylinders, a crank-shaft central to all of the cylinders, means for supporting the cylinders to turn around the center of the crank-shaft, pistons operating in the cylinders, connections between the pistons and crank-shaft, means for controlling fluid movement to and from the cylinders, said means including exhaust-ports in the working cylinders at the limit of the expansion-strokes of the pistons thereof, connections between each pump-cylinder and the two working cylinders adjacent thereto, and valves controlling said connections.

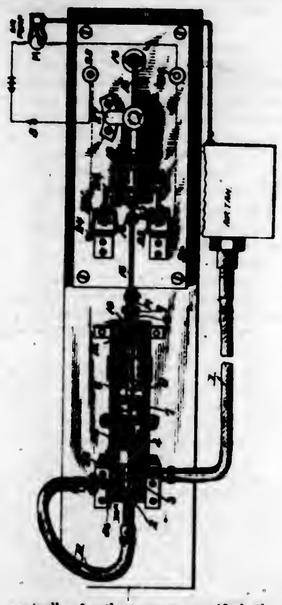
5. In an internal-combustion engine, the combination of a plurality of working cylinders and an equal number of pump-cylinders respectively arranged between the working cylinders, a crank-shaft central to all of the cylinders, means for supporting the cylinders to turn around the center of the crank-shaft, pistons operating in the cylinders, connections between the pistons and crank-shaft, means for controlling fluid movement to and from the cylinders, said means including exhaust-ports in the working cylinders at the limit of the expansion-strokes of the pistons thereof, connections between each pump-cylinder and the two working cylinders adjacent thereto, and valves controlling said connections, said valves being located respectively adjacent to the working cylinders and seating against the pressure therein.

809,088. AUTOMATIC ELECTRICAL CONTROLLER FOR AIR-COMPRESSORS. FRED D. ADKINSON, Kendallville, Ind. Filed May 17, 1905. Serial No. 260,966.

Claim.—1. The improved automatic controller for the purpose specified, comprising a valve-chest and valve, an air-cylinder and a slidable piston contained therein and connected with said valve, a spring for opposing the movement of the piston in one direction, a second air-cylinder having a spring-pressed piston, an air-conductor connecting such second cylinder with the valve-chest, a slidable bar connected with the last-named piston, a casing applied to and slidable on said bar, a spring contained within the said casing and applying pressure between it and the bar, an electrical switch one member of which is connected with the casing, and spring locking and release mechanism connected with the casing for holding it normally immovable and the switch normally closed until a certain predetermined air-pressure is accumulated, substantially as described.

2. The improved controlling apparatus for the purpose specified, comprising two air-cylinders and pistons therein having springs for opposing movement in one direction, an air-chamber having a slidable valve which is connected with one of said pistons, a pipe connecting the air-chamber with a second cylinder, and an automatic locking and releasing mechanism connected with the piston of the second cylinder and comprising a slidable bar, a device that is slidable on said bar and provided with abutments or shoulders, a spring arranged between said device and a projection on said bar, and a spring-pressed latch adapted to engage with and automatically release said device, substantially as shown and described.

3. In a controller for the purpose specified, the combination with an air-cylinder, a piston slidable therein, a slidable bar extending therefrom and a guide in which said bar works, a casing applied to both bar and slidable thereon, a spring interposed between one portion of such casing and a stop on the bar, the casing having a top portion provided with depressions at opposite ends, a locking and releasing mechanism comprising a spring-actuated plunger having at its free end a roller adapted to enter said depressions and thus lock the casing until the pressure of the plunger-spring is overcome, and a switch included in a motor-circuit and adapted to be broken when the air-pressure reaches a certain predetermined degree and the locking mechanism releases the cylinder which it engages, substantially as described.



4. In a controller for the purpose specified, the combination with an air-cylinder and means for connecting it with an air-storage tank, of a piston which is slidable in said cylinder, a spring applied thereto for opposing movement in one direction, a bar connected with the piston and slidable therewith, a casing applied to the bar and slidable thereon, a spring inclosed by the casing and arranged between one end thereof and a stop on the bar, a casing having on its upper side engaging shoulders, a locking and releasing mechanism comprising a vertical tube having a slot in its lower side, a plunger slidable in the tube and having a lateral pin working in said slot, a roller journaled in the lower end of the plunger and adapted to engage projections arranged on the casing and spaced apart, a spring pressing on said plunger, a screw for adjusting the tension of the spring, and a switch included in an electrical circuit and adapted to be instantaneously parted when the tension of the spring of the locking mechanism is overcome, substantially as described.

809,084. CAR-SEAT. FREDERICK BENNETT and SHERIDAN A. WALKER, New York, N. Y. Filed Oct. 20, 1903. Renewed May 3, 1905. Serial No. 258,726.

Claim.—1. The combination of a support, a seat movably mounted thereon, two intermediately-pivoted links mounted on the support and having their upper ends in connection with the seat, a back,

and means connecting the back with the lower ends of the links, to sustain the back.

2. The combination of a support, a seat movably mounted thereon, two intermediately-pivoted links mounted on the support and having their upper ends in connection with the seat, a back, and arms attached to the sides of the back and extending downward to and connected with the lower ends of the links to sustain the back on the links.

3. The combination of a support, a seat movably mounted thereon, two intermediately-pivoted links mounted on the support and having their upper ends in connection with the seat, a back, arms attached to the sides of the back and extending downward to and connected with the lower ends of the links, to sustain the back on the links the lower ends of the arms having enlargements, and a rocking foot-rest having parts between which said enlargements engage, whereby to operate the foot-rest in unison with the seat and back.

4. The combination of a support, a link hung thereon, a seat having connection with the link, to be operated thereby, a back, an arm attached to the back and extending downward to and having connection with the link, and a foot-rest including an elbow-like part, between the limbs of which the lower end of the arm projects whereby to operate the foot-rest in unison with the back and seat.

5. The combination of a support, an intermediately-pivoted link mounted thereon and extending in a vertical direction, a movable seat mounted on the support and engaged by the upper part of the link, and a movable back having a part extending downward in connection with the lower end of the link, the back being wholly sustained through the medium of the link, said arrangement causing the seat and back to change position simultaneously.

6. The combination of a support, a seat movably mounted thereon, an intermediately-pivoted link mounted on the support and extending in a vertical direction, the link having its upper portion engaged with the seat, a back, an arm attached to the back and extending downward therefrom and having connection with the lower portion of the link, the back being wholly sustained through the medium of the link, and a foot-rest mounted below said arm and engaged thereby, whereby to operate the seat, back and foot-rest simultaneously.

7. The combination with a support, of two links pivotally mounted thereon and hanging freely downward from the same, a back, and a member projecting downward from the back and having pivotal connection with the lower ends of the links to sustain the back through the medium of said links.

8. The combination with a support, of two links pivotally mounted thereon and hanging freely downward from the same, a back, a member projecting downward from the back and having pivotal connection with the lower ends of the links to sustain the back through the medium of said links, and a seat movably sustained on the support and adapted to be operated by said links whereby to shift the seat simultaneously with the back.

9. The combination with a support, of two links independently pivoted thereon and hanging downward therefrom, a back and a member projecting downward from the back and having the lower portions of the links independently pivoted thereto, the upper or supporting pivots being farther apart than the lower or second-named pivots.

10. The combination with a support, of two links independently pivoted thereon and hanging downward therefrom, a back and a member projecting downward from the back and having the lower portions of the links independently pivoted thereto, the upper or supporting pivots being farther apart than the lower or second-named pivots, and a seat movably mounted on the support and arranged to be operated by said links.

809,085. ELECTROLYTIC APPARATUS. HENRY S. BLACKMORE, Mount Vernon, N. Y. Filed July 22, 1903. Serial No. 166,203.

Claim.—1. An apparatus for electrolyzing light-metal compounds, comprising an electrolytic vessel having a means for producing a heavy and light metal alloy by the electrolysis of the light-metal compounds, in combination with means for displacing the heavy and light metal alloy by gravity, means for associating the heavy and light metal alloy with a metal hydroxid, means for removing the light-metal oxid thus produced, means for converting the light-metal oxid into light-metal hydroxid, and means for returning a portion of the light-metal hydroxid to the chamber containing the heavy and light metal alloy.

2. An apparatus for electrolyzing light-metal compounds, comprising an electrolytic vessel having a means for producing a lead and light-metal alloy by the electrolysis of the light-metal compounds, in combination with means for displacing the lead and light-metal alloy by gravity, means for associating the lead and light-metal alloy with a metal hydroxid, means for removing the light-metal oxid thus produced, means for converting the light-metal oxid into light-metal hydroxid, and means for returning a portion of the light-metal hydroxid to the chamber containing the lead and light-metal alloy.

3. An apparatus for electrolyzing light-metal compounds, comprising an electrolytic vessel having a means for producing a lead and light-metal alloy by the electrolysis of the light-metal compounds, in combination with means for displacing the lead and light-metal alloy by gravity, means for associating the lead and light-metal alloy with a metal hydroxid, and means for removing the light-metal oxid thus produced, means for exposing light-metal oxid to the action of steam, and means for returning a portion of the light-metal hydroxid thus produced to the chamber containing the lead and light-metal alloy.

4. An apparatus for electrolyzing alkali-metal compounds, comprising an electrolytic vessel having means for producing a heavy-metal and alkali-metal alloy by the electrolysis of the alkali-metal compound, in combination with means for displacing the heavy-metal and alkali-metal alloy by gravity, means for associating the heavy-metal and alkali-metal alloy with a metal hydroxid, means for removing the alkali-metal oxid thus produced, means for converting the alkali-metal oxid into alkali-metal hydroxid, and means for returning a portion of the alkali-metal hydroxid to the chamber containing the heavy-metal and alkali-metal alloy.

5. An apparatus for electrolyzing alkali-metal compounds, comprising an electrolytic vessel having means for producing lead and alkali-metal alloy by the electrolysis of the alkali-metal compound, in combination with means for displacing the lead and alkali-metal alloy by gravity, means for associating the lead and alkali-metal alloy with a metal hydroxid, means for removing the alkali-metal oxid thus produced, means for converting the alkali-metal oxid into alkali-metal hydroxid, and means for returning a portion of the alkali-metal hydroxid to the chamber containing the lead and alkali-metal alloy.

6. An apparatus for electrolyzing alkali-metal compounds, comprising an electrolytic vessel having means for producing lead and alkali-metal alloy by the electrolysis of the alkali-metal compound, in combination with means for displacing the lead and alkali-metal alloy by gravity, means for associating the lead and alkali-metal alloy with a metal hydroxid, means for removing the alkali-metal oxid thus produced, means for exposing the alkali-metal oxid to the action of steam, and means for returning a portion of the alkali-metal hydroxid thus produced to the chamber containing the lead and alkali-metal alloy.

7. An apparatus for electrolyzing sodium compounds, comprising an electrolytic vessel having means for producing a heavy-metal and sodium alloy by the electrolysis of the sodium compound, in combination with means for displacing the heavy-metal and sodium alloy by gravity, means for associating the heavy-metal and sodium alloy with a metal hydroxid, means for removing the sodium oxid thus produced, means for converting the sodium oxid into sodium hydroxid, and means for returning a portion of the sodium hydroxid to the chamber containing the heavy-metal and sodium alloy.

8. An apparatus for electrolyzing sodium compounds, comprising an electrolytic vessel having means for producing lead and sodium alloy by electrolysis of the sodium compound, in combination with means for displacing the lead and sodium alloy by gravity, means for associating the lead and sodium alloy with a metal hydroxid, means for removing the sodium oxid thus produced, means for converting the sodium oxid into sodium hydroxid, and means for returning a portion of the sodium hydroxid to the chamber containing the lead and sodium alloy.

9. An apparatus for electrolyzing sodium compounds, comprising an electrolytic vessel having means for producing lead and sodium alloy by the electrolysis of the sodium compound, in combination with means for displacing the lead and sodium alloy by gravity, means for associating the lead and sodium alloy with a metal hydroxid, means for removing the sodium oxid thus produced, means for exposing the sodium oxid to the action of steam, and means for returning a portion of the sodium hydroxid thus produced to the chamber containing the lead and sodium alloy.

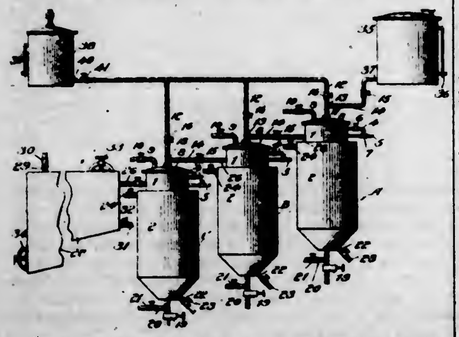
10. An apparatus for electrolyzing sodium chlorid, comprising an electrolytic vessel having means for producing a heavy-metal and sodium alloy by the electrolysis of sodium chlorid, in combination with means for displacing the heavy-metal and sodium alloy by gravity, means for associating the heavy-metal and sodium alloy with a metal hydroxid, means for removing the sodium oxid thus produced, means for converting the sodium oxid into sodium hydroxid, and means for returning a portion of the sodium hydroxid to the chamber containing the heavy-metal and sodium alloy.

11. An apparatus for electrolyzing sodium chlorid, comprising an electrolytic vessel having means for producing lead-sodium alloy by the electrolysis of sodium chlorid, in combination with means for displacing the lead-sodium alloy by gravity, means for associating the lead-sodium alloy with a metal hydroxid, means for removing the sodium oxid thus produced, means for converting the sodium oxid into sodium hydroxid, and means for returning a portion of the sodium hydroxid to the chamber containing the lead and sodium alloy.

12. An apparatus for electrolyzing sodium chlorid, comprising an electrolytic vessel having means for producing lead-sodium alloy by the electrolysis of sodium chlorid, in combination with means for displacing the lead-sodium alloy by gravity, means for associating the lead-sodium alloy with a metal hydroxid, means for removing the sodium oxid thus produced, means for exposing the sodium oxid to the action of steam, and means for returning a portion of the sodium hydroxid thus produced to the chamber containing the lead and sodium alloy.

809,086. PROCESS OF EXTRACTING SULFUR FROM THE SULFUR-CONTAINING CONSTITUENTS OF PETROLEUM.

HENRY S. BLACKMORE, Mount Vernon, N. Y., assignor, by direct and mesne assignments, to Black-Ford Utility Oil Company, a Corporation of the District of Columbia. Filed Dec. 12, 1904. Serial No. 236,420.



Claim.—1. The process of removing sulfur from petroleum containing the same, which consists in exposing sulfur-containing petroleum to the action of a metal-hydrogen carbid.

2. The process of removing sulfur from petroleum containing the same, which consists in exposing the sulfur-containing petroleum to the action of zinc-hydrogen carbid.

3. The process of removing sulfur from the constituents of petroleum, which consists in exposing the sulfur-containing constituent to the action of a metal-hydrogen carbid.

4. The process of removing sulfur from the constituents of petroleum, which consists in exposing the sulfur-containing constituent to the action of zinc-hydrogen carbid.

5. The process of removing sulfur from oil containing the same, which consists in exposing the sulfur-containing oil to the action of a metal-hydrogen carbid.

6. The process of removing sulfur from oil containing the same, which consists in exposing the sulfur-containing oil to the action of zinc-hydrogen carbid.

7. The process of producing hydrogen carbid, which consists in exposing a metal-hydrogen carbid to the action of sulfurous petroleum maintained at a reacting temperature.

8. The process of producing hydrogen carbid, which consists in exposing zinc-hydrogen carbid to the action of sulfurous petroleum maintained at a reacting temperature.

9. The process of producing hydrogen carbid, which consists in mixing sulfurous petroleum with a metal-hydrogen carbid while abstracting the heat evolved, by refrigeration.

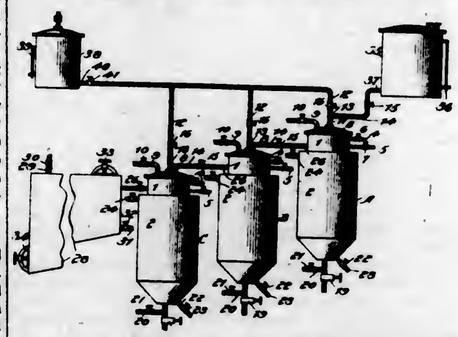
10. The process of removing sulfur from sulfurous petroleum, which consists in exposing it to the action of a metal-hydrogen carbid maintained at a reacting temperature.

11. The process of purifying petroleum, which consists in exposing petroleum to the action of a metal-hydrogen carbid.

12. The process of purifying petroleum, which consists in exposing a refrigerated petroleum to the action of a metal-hydrogen carbid.

809,087. PROCESS OF ELIMINATING SULFUR FROM THE SULFUR-CONTAINING CONSTITUENTS OF PETROLEUM.

HENRY S. BLACKMORE, Mount Vernon, N. Y., assignor, by direct and mesne assignments, to Black-Ford Utility Oil Company, a Corporation of the District of Columbia. Filed Dec. 12, 1904. Serial No. 236,421.



Claim.—1. The process of removing sulfur from petroleum containing the same, which consists in exposing sulfur containing petroleum to the action of a metal carbonyl.

2. The process of removing sulfur from petroleum containing the same, which consists in exposing the sulfur-containing petroleum to the action of nickel carbonyl.

3. The process of removing sulfur from the constitutents of petroleum, which consists in exposing the sulfur-containing constituent to the action of a metal carbonyl.

4. The process of removing sulfur from the constituents of petroleum, which consists in exposing the sulfur-containing constituent to the action of a nickel carbonyl.

5. The process of removing sulfur from oil containing the same, which consists in exposing the sulfur containing oil to the action of a metal carbonyl.

6. The process of removing sulfur from oil containing the same, which consists in exposing the sulfur-containing oil to the action of nickel carbonyl.

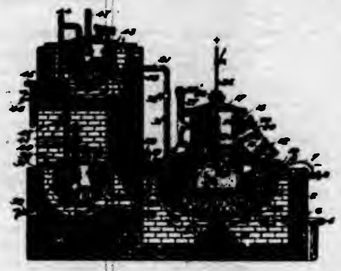
7. The process of purifying petroleum, which consists in exposing petroleum to the action of a metal carbonyl.

8. The continuous process of removing sulfur from sulfur-containing constituents of petroleum, which consists in exposing the sulfur-containing constituent to the action of a metal carbonyl, oxidizing the metal sulfid produced, deoxidizing the resultant metal oxid, exposing the same to the action of carbonic oxid liberated during the precipitation of the metal content of a previous increment of metal carbonyl whereby a new increment of metal carbonyl is produced, and exposing the metal carbonyl thus produced to the action of more sulfur-containing petroleum, substantially as described.

9. The continuous process of removing sulfur from sulfur-containing constituents of petroleum, which consists in exposing the sulfur-containing constituent to the action of a nickel carbonyl, oxidizing the metal sulfid produced, deoxidizing the resultant metal oxid, exposing the same to the action of carbonic oxid liberated during the precipitation of the metal content of a previous increment of nickel carbonyl whereby a new increment of nickel carbonyl is produced, and exposing the nickel carbonyl thus produced to the action of more sulfur-containing petroleum, substantially as described.

809,088. PROCESS OF PRODUCING CAUSTIC ALKALI.

HENRY S. BLACKMORE, Mount Vernon, N. Y. Filed May 10, 1905. Serial No. 259,818.



Claim.—1. The process of producing caustic alkali, which consists in providing a liquid-metal cathode having in communication therewith a liquefied alkali-metal compound of a weight sufficient to depress the surface thereof below its normal level, electrolyzing the alkali-metal compound whereby the alkali metal is deposited upon or unites with the depressed surface of the liquid-metal cathode, displacing the liquid metal containing the alkali metal from contact with the liquefied alkali-metal compound by gravity, and removing the alkali metal therein therefrom by the action of a fluid-metal hydroxid.

2. The process of producing caustic alkali, which consists in providing a liquid-metal cathode having in communication therewith a liquefied sodium compound of a weight sufficient to depress the surface thereof below its normal level, electrolyzing the sodium compound whereby the sodium is deposited upon or unites with the depressed surface of the liquid metal, displacing the liquid metal containing the sodium from contact with the liquefied sodium compound by gravity and removing the sodium therein therefrom by the action of fluid sodium hydroxid.

3. The process of producing caustic alkali, which consists in providing a liquid-metal cathode having in communication therewith liquefied sodium chlorid of a weight sufficient to depress the surface thereof below its normal level, electrolyzing the sodium chlorid whereby sodium is deposited upon or unites with the depressed surface of the liquid-metal cathode, displacing the liquid metal containing the sodium from contact with the liquefied sodium chlorid by gravity and removing the alkali metal therein therefrom by the action of fluid sodium hydroxid.

4. The process of producing caustic alkali, which consists in providing a liquid-lead cathode having in communication therewith a liquefied alkali-metal compound of sufficient weight to depress the surface thereof below its normal level, electrolyzing the alkali-metal compound whereby the alkali metal is deposited upon or unites with the depressed surface of the liquid-lead cathode, displacing the liquid lead containing the alkali metal from contact with the liquefied alkali-metal compound by gravity and removing the alkali metal therein therefrom by the action of fluid-metal hydroxid.

5. The process of producing caustic alkali, which consists in providing a liquid-lead cathode having in communication therewith liquefied sodium compound of sufficient weight to depress the surface thereof below its normal level, electrolyzing the sodium compound whereby the sodium is deposited upon or unites with the depressed surface of the liquid-lead cathode, displacing the liquid lead containing the sodium from contact with the liquefied sodium compound by gravity and removing the sodium therein therefrom by the action of fluid-metal hydroxid.

6. The process of producing caustic alkali, which consists in providing a liquid-lead cathode having in communication therewith liquefied sodium chlorid of sufficient weight to depress the surface thereof below its normal level, electrolyzing the sodium chlorid whereby the sodium is deposited upon or unites with the depressed surface of the liquid-lead cathode, displacing the liquid lead containing the sodium from contact with the liquefied sodium chlorid by gravity and removing the sodium therein therefrom by the action of fluid-metal hydroxid.

7. The process of producing caustic alkali, which consists in providing a liquid-metal cathode having in communication therewith a liquefied alkali-metal compound together with an inert granulated diaphragm, the whole of a weight sufficient to depress the surface thereof below its normal level, electrolyzing the alkali-metal compound whereby the alkali metal is deposited upon or unites with the depressed surface of the liquid-metal cathode, displacing the liquid metal containing the alkali metal from contact with the liquefied alkali-metal compound by gravity, and removing the alkali metal therein therefrom by the action of a fluid-metal hydroxid.

8. The process of producing caustic alkali, which consists in providing a liquid-metal cathode having in communication therewith a liquefied sodium compound together with an inert granulated diaphragm, the whole of a weight sufficient to depress the surface thereof below its normal level, electrolyzing the sodium compound whereby the sodium is deposited upon or unites with the depressed surface of the liquid-metal cathode, displacing the liquid metal containing the sodium from contact with the liquefied sodium compound by gravity, and removing the sodium therein therefrom by the action of fluid-metal hydroxid.

9. The process of producing caustic alkali, which consists in providing a liquid-metal cathode having in communication therewith liquefied sodium chlorid together with an inert granulated diaphragm, the whole of a weight sufficient to depress the surface thereof below its normal level, electrolyzing the sodium chlorid whereby the sodium is deposited upon or unites with the depressed surface of the liquid-metal cathode, displacing the liquid metal containing the sodium from contact with the liquefied sodium chlorid by gravity, and removing the sodium therein therefrom by the action of fluid-metal hydroxid.

10. The process of producing caustic alkali, which consists in providing a liquid-metal cathode having in communication therewith a liquefied alkali-metal compound together with diaphragm of granulated magnetite, the whole of a weight sufficient to depress the surface thereof below its normal level, electrolyzing the alkali-metal compound whereby the alkali metal is deposited upon or unites with the depressed surface of the liquid-metal cathode, displacing the liquid metal containing the alkali metal from contact with the liquefied alkali-metal compound by gravity, and removing the alkali metal therein therefrom by the action of a fluid-metal hydroxid.

11. The process of producing caustic alkali, which consists in providing a liquid-metal cathode having in communication therewith a liquefied sodium compound together with a diaphragm of granulated magnetite, the whole of a weight sufficient to depress the surface thereof below its normal level, electrolyzing the sodium compound whereby the sodium is deposited upon or unites with the depressed surface of the liquid-metal cathode, displacing the liquid metal containing the sodium from contact with the liquefied sodium compound by gravity, and removing the sodium therein therefrom by the action of fluid-metal hydroxid.

12. The process of producing caustic alkali, which consists in providing a liquid-metal cathode having in communication therewith liquefied sodium chlorid together with a diaphragm of granulated magnetite, the whole of a weight sufficient to depress the surface thereof below its normal level, electrolyzing the sodium chlorid whereby the sodium is deposited upon or unites with the depressed surface of the liquid-metal cathode, displacing the liquid metal containing the sodium from contact with the sodium chlorid by gravity, and removing the sodium therein therefrom by the action of fluid-metal hydroxid.

13. The process of electrolyzing metal compounds, which consists in providing a liquid-metal cathode having in communication therewith a diaphragm of granulated inert material together with a liquefied metal compound, electrolyzing the metal compound whereby the metal is deposited upon or unites with the liquid-metal cathode, and discharging the electronegative products liberated within the metal compound therefrom by the combined action of the granulated substance of the diaphragm, and gravity.

14. The process of electrolyzing light-metal compounds, which consists in providing a liquid-metal cathode having in communication therewith a diaphragm of granulated inert material together with a liquefied light-metal compound, electrolyzing the light-metal compound whereby the light metal is deposited upon or unites with the liquid-metal cathode, and discharging the electronegative products liberated within the light-metal compound therefrom by the combined action of the granulated substance of the diaphragm, and gravity.

15. The process of electrolyzing sodium compounds, which consists in providing a liquid-metal cathode having in communication therewith a diaphragm of granulated inert material together with a liquefied sodium compound, electrolyzing the sodium compound whereby the sodium is deposited upon or unites with the liquid-metal cathode, and discharging the electronegative products liberated within the sodium compound therefrom by the combined action of the granulated substance of the diaphragm, and gravity.

809,089. PROCESS OF MAKING CAUSTIC ALKALI. HENRY S. BLACKMORE, Mount Vernon, N. Y. Filed May 10, 1905. Serial No. 259,819.

Claim.—1. The process of making caustic alkali from salts of alkali metals, which consists in introducing into a cell containing an aqueous solution of the alkali-metal salt to be decomposed, a liquid metal, liberating the alkali metal in juxtaposition to the liquid metal by electrolysis, causing the liquid metal containing the alkali metal to pass into a separate or oxidizing cell through a liquid compound breaking its metallic connection between the liquid metal in the electrolytic cell and the liquid metal in the oxidizing-cell, by gravity, oxidizing the alkali metal contained in the liquid metal in the oxidizing-cell with the formation of caustic alkali, by electrolysis, and causing the liquid metal depleted of alkali to pass from the oxidizing-cell by gravity.

2. The process of making caustic alkali from salts of alkali metals, which consists in passing a liquid metal through an electrolytic cell containing an aqueous solution of the alkali-metal salt to be decomposed during electrolysis, decreasing the density and increasing the bulk of the liquid metal in the said electrolytic cell by causing it to unite with the alkali metal liberated by electrolysis therein, and causing it to overflow into a separate or oxidizing cell through a liquid compound capable of breaking metallic contact of the liquid metal in the separate cells from each other, by gravity, increasing the density of the liquid metal in the oxidizing-cell by separating the alkali metal therefrom by electrolytic oxidation, and discharging the liquid metal, thus separated from alkali metal, therefrom, by gravity.

3. The process of making caustic soda from sodium compounds, which consists in introducing into a cell containing an aqueous solution of the sodium compound to be decomposed, a liquid metal, liberating the sodium in juxtaposition to the liquid metal by electrolysis, causing the liquid metal containing the sodium to pass into a separate or oxidizing cell through a liquid compound breaking its metallic connection between the liquid metal in the electrolytic cell, and the liquid metal in the oxidizing-cell, by gravity, oxidizing the sodium contained in the liquid metal in the oxidizing-cell with the formation of caustic soda by electrolysis and causing the liquid metal depleted of sodium to pass from the oxidizing-cell, by gravity.

4. The process of making caustic soda from sodium chlorid, which consists in introducing into a cell containing an aqueous solution of the sodium chlorid to be decomposed, a liquid metal, liberating the sodium in juxtaposition to the liquid metal by electrolysis, causing the liquid metal containing the sodium to pass into a separate or oxidizing cell through a liquid compound breaking its metallic connection between the liquid metal in the electrolytic cell, and the liquid metal in the oxidizing-cell, by gravity, oxidizing the sodium contained in the liquid metal in the oxidizing-cell with the formation of caustic soda by electrolysis and causing the liquid metal depleted of sodium to pass from the oxidizing-cell, by gravity.

5. The process of making caustic alkali from salts of alkali metal, which consists in introducing mercury into a cell containing an aqueous solution of the alkali-metal salt to be decomposed, liberating the alkali metal in juxtaposition to the mercury, causing the mercury containing the alkali metal to pass into a separate or oxidising cell through a liquid compound breaking its metallic connection between the mercury in the electrolytic cell and the mercury in the oxidising-cell, by gravity, oxidising the alkali metal contained in the mercury in the oxidising-cell with the formation of caustic alkali, by electrolysis, and causing the mercury depleted of alkali to pass from the oxidising-cell by gravity.

6. The process of making caustic soda from sodium compounds, which consists in introducing mercury into a cell containing an aqueous solution of the sodium compound to be decomposed, liberating the sodium in juxtaposition to the mercury by electrolysis, causing the mercury containing the sodium to pass into a separate or oxidising cell through a liquid compound breaking its metallic connection between the mercury in the electrolytic cell, and the mercury in the oxidising-cell, by gravity, oxidizing the sodium contained in the mercury in the oxidizing-cell with the formation of caustic soda by electrolysis and causing the mercury depleted of sodium to pass from the oxidizing-cell, by gravity.

7. The process of making caustic soda from sodium chlorid, which consists in introducing mercury into a cell containing an aqueous solution of the sodium chlorid to be decomposed, liberating the sodium in juxtaposition to the mercury by electrolysis, causing the mercury containing the sodium to pass into a separate or oxidizing cell through a liquid compound breaking its metallic connection between the mercury in the electrolytic cell, and the mercury in the oxidizing-cell, by gravity, oxidizing the sodium contained in the mercury in the oxidizing-cell with the formation of caustic soda by electrolysis and causing the mercury depleted of sodium to pass from the oxidizing-cell, by gravity.

8. The process of making caustic alkali from salts of alkali metals, which consists in passing mercury through an electrolytic cell containing an aqueous solution of the alkali-metal salt to be decomposed during electrolysis, decreasing the density and increasing the bulk of the mercury in the said electrolytic cell by causing it to unite with the alkali metal liberated by electrolysis therein, and causing it to overflow into a separate or oxidizing cell through a liquid compound capable of breaking metallic contact of the mercury in the separate cells from each other, by gravity, increasing the density of the mercury in the oxidizing-cell by separating the alkali metal therefrom by electrolytic oxidation, and discharging the mercury, thus separated from alkali metal, by gravity.

9. The process of making caustic alkali from salts of alkali metals, which consists in passing mercury through an electrolytic cell containing an aqueous solution of an alkali-metal salt to be decomposed during electrolysis, decreasing the density and increasing the bulk of the mercury in the said electrolytic cell by causing it to unite with the alkali metal liberated by electrolysis therein, causing it to overflow into a separate or oxidizing cell through an electrically non-conductive liquid capable of breaking metallic contact of the mercury in the separate cells from each other, by gravity, increasing the density of the mercury in the oxidizing-cell by separating the alkali metal therefrom by electrolytic oxidation, and discharging the mercury, thus separated from the alkali metal, therefrom, by gravity.

10. The process of making caustic alkali from salts of alkali metals, which consists in passing mercury through an electrolytic cell containing an aqueous solution of an alkali-metal salt to be decomposed during electrolysis, decreasing the density and increasing the bulk of the mercury in the said electrolytic cell by causing it to unite with the alkali metal liberated by electrolysis therein, causing it to overflow into a separate or oxidizing cell through carbon tetrachlorid thereby breaking metallic contact of the mercury in the separate cells from each other, increasing the density of the mercury in the oxidizing-cell by separating the alkali metal therefrom by electrolytic oxidation, and discharging the mercury, thus separated from the alkali metal, by gravity.

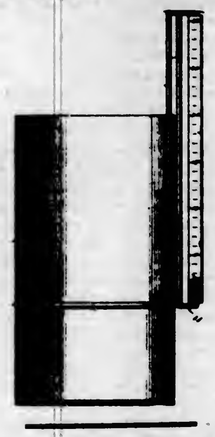
809,090. INTERIOR CONCRETE STRUCTURAL WORK. FRANK C. CAHN, Cleveland, Ohio. Filed Mar. 24, 1905. Serial No. 251,396.

Claim.—The I-beams and the cross-stays connecting the same at intervals, concrete slabs suspended from said stays between said beams and temporary auxiliary supports for said slabs comprising beams beneath and supports above, and means engaging said beams with said supports.

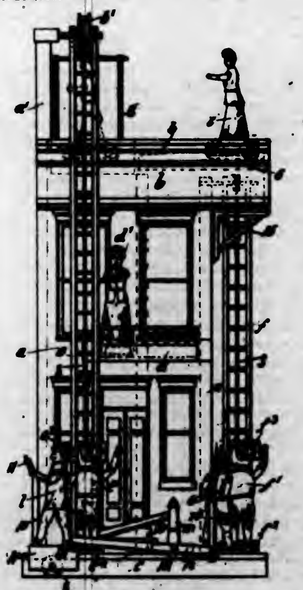
809,091. COMPUTING MEASURING VESSEL. WILLIAM S. CAIN, Chicago, Ill. Filed May 11, 1905. Serial No. 259,883.

Claim.—1. The combination with a measuring vessel, of a false bottom which may be raised or lowered therein, a rod connected and movable with the bottom and extending up above the upper edge of the vessel and down beside the wall thereof, on the outside thereof, and a price-scale bar carried by said rod.

2. The combination with a measuring vessel, of a false bottom which may be raised or lowered therein, a rotatable scale-bar, having a plurality of scales, extending beside the wall of the vessel, on the outside thereof, and movable with said bottom, and a rod connecting the scale-bar and bottom.



809,092. TOY. FRANCIS W. CARPENTER, Greenwich, Conn., assignor to Frederick F. Carpenter, New York, N. Y. Filed May 11, 1904. Serial No. 207,377.



Claim.—1. The combination in a toy, of a toy building and sidewalk, a toy elevator adapted to descend through a shaft in the building, a tilting platform in line with the elevator and pivotally connected to the roof of the toy building, a toy rolling figure adapted to normally rest upon the platform and with its movement to descend and roll upon the platform of the elevator, an inclined toy ladder at one end resting upon the sidewalk and at its other end supported upon the toy building, the toy figure of a fireman, and means connecting the same with the ladder and a cord for drawing said toy figure up the ladder so that it may strike the tilting platform and overbalance the same.

3. The combination in a toy of a toy building and sidewalk, a toy elevator adapted to descend through a shaft in the building, a tilting platform in line with the elevator and pivotally connected to the roof of the toy building, a toy rolling figure adapted to normally rest upon the platform and with its movement to descend and roll upon the platform of the elevator, an inclined toy ladder at the lower end connected to the sidewalk and at the upper end to a support of the toy building, a pulley mounted upon said support, a toy figure and means connecting the toy figure to the inclined toy ladder, a cord from the toy figure over said pulley and connected to the top of the elevator, a projected balcony from the toy building, and a toy figure resting upon said platform and having outstretched arms and clasped hands forming a loop, the toy figure connected to the ladder having an outstretched arm adapted to pass within the loop of the toy figure upon the balcony.

4. The combination in a toy, of a toy building and sidewalk, a toy elevator adapted to descend through a shaft in the building, a tilting platform in line with the elevator and pivotally connected to the roof of the toy building, a toy rolling figure adapted to normally rest upon the platform and with its movement to descend and roll upon the platform of the elevator, an inclined toy ladder at the lower end connected to the sidewalk and at the upper end to a support of the toy building, a pulley mounted upon said support, a toy figure and means connecting the toy figure to the inclined toy ladder, a cord from the toy figure over said pulley and connected to the top of the elevator, a projected balcony from the toy building, a toy figure resting upon said platform and having outstretched arms and clasped hands forming a loop, the toy figure connected to the ladder having an outstretched arm adapted to pass within the loop of the toy figure upon the balcony, a projection from the lower support to the ladder of the toy figure of the fireman, means normally extending over said projection for holding down said figure and supporting the elevator in its raised position, and a device manually operated for releasing this holding device so as to permit the elevator to descend

5. The combination in a toy, of a toy building and sidewalk, a toy elevator adapted to descend through a shaft in the building, a tilting platform in line with the elevator and pivotally connected to the roof of the toy building, a toy rolling figure adapted to normally rest upon the platform and with its movement to descend and roll upon the platform of the elevator, an inclined toy ladder at the lower end resting upon the sidewalk and at the upper end secured to a support of the toy building, a pulley mounted upon said support, a toy figure and means connecting the same to the inclined toy ladder, a cord from the toy figure over said pulley and connected to the elevator, a projected balcony from the toy building and a toy figure resting upon said balcony and having outstretched arms and clasped hands forming a loop, the toy figure connected to the ladder having an outstretched arm adapted to pass between the arms of the toy figure upon the balcony, a projection upon the lowermost means connecting the toy figure to the ladder, a platform *b* pivoted to the sidewalk and normally extending over said projection, the toy figure of a fireman mounted upon said platform, a pivoted arm manually operated and adapted to engage said platform to hold the same in an initial position, and a spring for moving the platform.

6. The combination in a toy, of a toy building and sidewalk, a toy elevator adapted to descend through a shaft in the building, a tilting platform in line with the elevator and pivotally connected to the roof of the toy building, a toy rolling figure adapted to normally rest upon the platform and with its movement to descend and roll upon the platform of the elevator, an inclined toy ladder at the lower end resting upon the sidewalk and at the upper end secured to a support of the toy building, a pulley mounted upon said support, a toy figure and loops connecting the same to the inclined toy ladder, a cord from the toy figure over said pulley and connected to the elevator, a projected balcony from the toy building and a toy figure resting upon said balcony and having outstretched arms and clasped hands forming a loop, the toy figure connected to the ladder having an outstretched arm adapted to pass between the arms of the toy figure upon the balcony, a projection upon the lower loop of the toy figure, a platform *b* pivoted to the sidewalk and normally extending over said projection, the toy figure of a fireman mounted upon said

platform, a pivoted arm manually operated and adapted to engage said platform to hold the same in an initial position, a spring for moving the platform, a toy hydrant attached to the sidewalk, a hose therefrom to the toy figure of the fireman upon the platform *k*, a toy nozzle held by the outstretched hands of said toy figure, and another toy figure *o* of a fireman with outstretched arms and approaching hands, and an upright arm *n'* from one end of the pivoted arm passing through the hands of the toy figure *o* and guided thereby, whereby the arms *n'* and *n* may be manually operated for the release of the pivoted plate *k* and the parts carried thereby.

7. The combination in a toy, of a toy building and a sidewalk extending out from the base of the building, a plate *k* pivotally connected to the sidewalk and adapted to swing around one corner of the sidewalk, the toy representation of a hydrant, a toy hose therefrom, a toy figure of a fireman connected upon the outer end of the pivoted plate *k* and to the outstretched hands of which the toy hose passes, a toy nozzle terminating the hose in the hands of the toy figure, a rocking arm *n* pivoted to the base of the toy hydrant, a toy figure *o* of a fireman mounted upon said sidewalk, an upright arm *n'* passing between the outstretched hands of said toy figure and guided thereby, a pin 13 depending from the opposite end of the rocking arm and entering an aperture in the end of the pivoted plate *k*, a spring 9 at one end connected to one end of the plate *k* and at its other end to a post of the sidewalk and adapted upon the swinging of the arm *k* and the release of its pin 13 to move the said pivoted plate and change the position of the toy figure of the fireman.

8. The combination in a toy, of a toy building and a sidewalk extending out from the base of the building, a plate *k* pivotally connected to the sidewalk, means manually operated for holding the plate in a predetermined position, a toy figure of a fireman connected upon the outer end of the pivoted plate and a spring at one end connected to a post of the sidewalk and adapted upon the release of said plate *k* to swing the same with the figure of the fireman into a new position.

9. The combination in a toy, of a toy building and a sidewalk extending out from the base of the building, a plate *k* pivotally connected to the sidewalk, a support-roller at the outer end of the plate, means manually operated for holding the plate in a predetermined position, a toy figure of a fireman connected upon the outer end of the pivoted plate and a spring at one end connected to one end of the plate *k* and at its other end connected to a post of the sidewalk and adapted upon the release of said plate *k* to swing the same with the figure of the fireman into a new position.

10. The combination in a toy, of a toy plate and a sidewalk extending out from the base of the plate, a plate *k* pivotedly connected to the sidewalk, means manually operated for holding the plate in a predetermined position, a toy figure of a fireman connected upon the outer end of the pivoted plate, and a spring at one end connected to one end of the plate *k*, and at its other end connected to a post of the sidewalk and adapted upon the release of said plate *k* to swing the same with the figure of the fireman into a new position.

11. The combination in a toy, of a toy building and base, a toy elevator and guides in which the same is adapted to descend, a ladder from the base to near the top of the elevator, a toy figure exceeding the weight of the elevator, and guides therefor to the ladder, a pulley, a cord connecting the elevator and toy figure over the pulley, a rolling base having a toy figure and means for projecting the same onto the elevator where its added weight causes the elevator to descend the first-named guides drawing up the figure on the ladder and means causing the rolling base in its lowered position to run off the elevator permitting the figure to return the elevator to a normal position.

12. The combination in a toy, of a toy building and base, a toy elevator adapted to descend in guides, a ladder from the base to near the top of the elevator, a toy figure having an outstretched arm and exceeding the weight of the elevator and guides for the figure to the ladder, a pulley, a cord passing thereover and connecting the elevator and toy figure, a balcony on the face of the building, a toy figure placed thereon with outstretched arms and clasped hands, a rolling base having a toy figure and means for projecting the same onto the elevator, substantially as specified.

13 The combination in a toy, of a toy building and a sidewalk extending out from the base of the building, a plate *k* pivotally connected to the sidewalk, a toy figure of a fireman connected upon the outer end of the pivoted plate, a toy representation of a hydrant on said sidewalk, a toy hose therefrom and a toy nozzle terminating the hose in the hands of the toy figure of the fireman on the plate, means adapted for holding the plate in a predetermined position and which may be operated for releasing the same and a spring at one end connected to the sidewalk and at the other end to an end of said plate and adapted upon the release of said plate to swing the same with the figure of the fireman to a new position.

14. The combination in a toy, of an upright toy structure and base, a toy elevator adapted to descend in guides, a ladder from the base to near the top of the elevator, a toy figure exceeding the weight of the elevator and guides therefor to the ladder, a pulley, a cord connecting the elevator and toy figure over the pulley, a rolling base and a toy device supported thereby, means for projecting the same onto the elevator where its added weight causes the elevator to descend the first-named guides drawing up the figure on the ladder, and means causing the rolling base to then run off the elevator, permitting the figure to return the elevator to a normal position.

15. The combination in a toy, of a toy building, a toy elevator and means adapting the same to descend from the upper to the lower part thereof, a cord from the top of the elevator and a weighted figure on the other end of the cord overbalancing the weight of the elevator and normally holding the elevator in position at the upper part of the building, a toy rolling device, a tilting support for normally holding the same, and means for actuating the said support to cause the toy rolling device to move therefrom onto the platform and by the increased weight to cause the platform to descend and to raise the weighted figure on the other end of the cord, and a weighted figure in an elevated position so located as to be engaged by the weighted figure as raised by the elevator and to be lifted off its support, and to be temporarily carried by said weighted figure, and means for discharging the rolling toy device from the elevator near the lower part of the building thereby providing for the ascent of the elevator by the combined weights at the other end of the cord.

16. The combination in a toy, of a toy building, a toy elevator and means adapting the same to descend from the upper to the lower part thereof, a cord from the top of the elevator and a weighted figure on the other end of the cord overbalancing the weight of the elevator and normally holding the elevator in position at the upper part of the building, a toy rolling device, a tilting support for normally holding the same, and means for actuating the said support to cause the toy rolling device to move therefrom onto the platform and by the increased weight to cause the platform to descend and to raise the weighted figure on the other end of the cord, a weighted figure in an elevated position so located as to be engaged by the weighted figure as raised by the elevator and to be lifted off its support and to be temporarily carried by said weighted figure, and means for discharging the rolling toy device from the elevator near the lower part of the building thereby providing for the ascent of the elevator by the combined weights at the other end of the cord, and means adapted to be manually actuated and to engage the weighted figure at the end of the elevator-cord and hold the same so that the release of the elevator is at the pleasure of the party operating the toy.

17. The combination in a toy, of a toy building, a toy elevator, and means adapting the same to descend from the upper to the lower part of the building, a platform and a pivot therefor to the upper part of the building providing for the tilting of the platform, a rolling weighted figure adapted to normally rest upon the platform, and means manually actuated for tilting the platform and causing the rolling weighted figure to move off the same onto the elevator-platform.

18. The combination in a toy, of a toy building, a toy elevator and guides therefor adapting the elevator to rise and fall from the upper to the lower part of the building, a tilting platform pivotally connected to the roof of the toy building, a toy device of greater weight than the weight of the elevator and adapted to overbalance the same, a cord connecting the elevator and said toy device, and a pulley over which the same passes, a movable toy device adapted to descend upon the platform of the elevator and overbalance the same, causing its descent from the upper to the lower part of the building, and a manually-operated device engaging the toy device connected to the elevator-rope for temporarily holding the same and the elevator in position, the release of which permits the descent of the elevator with the rolling toy figure.

809,093. NAVIGABLE BALLOON. ALFRED CHERONNA, Zurich, Switzerland. Filed Apr. 26, 1905. Serial No. 256,676.

Claim.—1. In an air-ship, a propeller-frame, a propeller rotatably carried by said frame, a support for the latter, a hinged connection between the support and frame, a driving-shaft and separable driving elements connecting the shaft and propeller.

2. In an air-ship, the combination with a driving-shaft and a friction driving element thereon, of a propeller-frame, a propeller rotatably mounted therein and having a complementary friction-driven element, a support for the propeller-frame and a hinge connection between the support and said frame.

3. In an air-ship, the combination with the driving-shaft of a propeller-frame, a propeller rotatably mounted therein, a support for the propeller-frame to which the latter is hinged and adjustable about an axis at right angles to the axis of rotation of the propeller and separable driving elements connecting said propeller to the driving-shaft.

4. In an air-ship, the combination with a motor having two driving-shafts, each composed of two sections adapted to be coupled and uncoupled; of a propeller for each driving-shaft, a propeller-frame for each propeller in which frames said propellers are rotatably mounted, supports for said frames, a hinged connection between the frames and their respective supports and separable driving elements connecting the propellers to their driving-shafts.

5. In an air-ship, the combination with a motor having two driving-shafts, each composed of two sections adapted to be coupled and uncoupled; of a propeller for each driving-shaft, a propeller-frame for each propeller in which frames said propellers are rotatably mounted, supports for said frames about which the latter are adjustable about an axis at right angles to the axis of rotation of the propellers, a hinged connection between the frames and their respective supports and separable driving elements connecting the propellers to their driving-shafts.

6. In an air-ship, the combination with a motor having two motor-shafts, each composed of two sections adapted to be coupled and uncoupled; of a propeller for each driving-shaft, a propeller-frame for each propeller, in which frames said propellers are rotatably mounted, supports for said propeller-frames, separable connections between said supports and frames and means to adjust the frames independently of each other about an axis at right angles to the axis of rotation of the propellers.

7. In an air-ship, the combination with a motor having two motor-shafts, each composed of two sections adapted to be coupled and uncoupled; of a propeller for each driving-shaft, a propeller-frame for each propeller, in which frames said propellers are rotatably mounted, supports for said propeller-frames, a hinge connection and a separable connection between the propeller-frames and their respective supports, and means to adjust the frames independently of each other about an axis at right angles to the axis of rotation of the propellers.

8. In an air-ship, a propeller-frame, a propeller rotatably carried by said frame, a fixed support, a frame-support comprising a normally stationary element, a hinge connection between the latter and the fixed support and a frame-carrying element revolvable about said stationary element and about an axis at right angles to the axis of rotation of the propeller; in combination with a driving-shaft and separable driving elements connecting said shaft to the propeller.

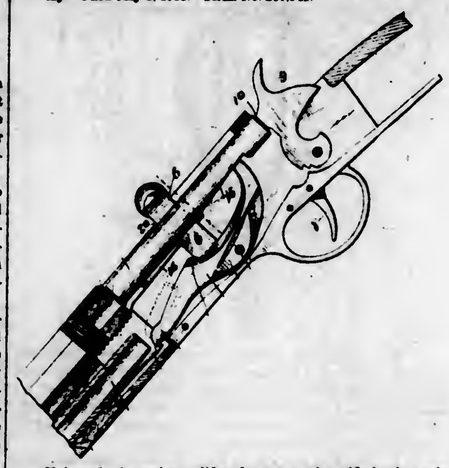
9. In an air-ship, a motor, a horizontal driving-shaft and friction-disks driven thereby; in combination with propeller-wheels having a peripheral flange in contact with their respective friction-disks, the vertical shafts for said wheels, arms in which said shafts have their bearings, a friction-wheel on one of said arms in contact with the aforesaid peripheral flange and a relatively stationary support for said arms, for the purpose set forth.

10. In an air-ship, the combination with a motor having two shafts, each composed of two sections adapted to be coupled and uncoupled, of a plurality of supporting-rods, rings hinged to said rods, a propeller for each driving-shaft and a propeller-frame for each propeller rotatably mounted on said rings.

11. In an air-ship, the combination with a motor having two shafts, each composed of two sections adapted to be coupled and uncoupled, of a plurality of fixed supporting-rods, circular bearing members hinged to said rods, supporting members rotatably mounted on the bearing members, propeller-frames mounted on the supporting members, and a propeller rotatably mounted in each frame.

12. In an air-ship, the combination with a motor having two shafts, each composed of two sections adapted to be coupled and uncoupled, of a plurality of fixed supporting-rods, bearings for one section of each shaft supported by said rods, circular bearing members hinged to said rods, supporting members rotatably mounted on said circular bearing members, propeller-frames mounted on the rotatable supporting members and a propeller rotatably mounted in each frame.

809,094. MAGAZINE-RIFLE. WILLIAM B. CLAY, Williamstown, Ky. Filed July 1, 1905. Serial No. 267,941.



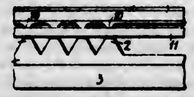
Claim.—1. A carrier or lifter for a repeating rifle having substantially one half of its efficient upper surface of crescent shape and the other half of said face substantially straight in combination with the lower end of the locking-bolt, which engages said efficient upper crescent-shaped surface of the carrier or lifter and rocks the same.

2. A carrier or lifter for a repeating rifle having the upper half of its efficient surface cam-shaped, and the other half or part provided with a trough to receive a cartridge in combination with the lower end of the locking-bolt which engages said efficient cam-shaped surface and operates the said lifter or carrier.

3. In a repeating rifle of the character described, a pivoted carrier or lifter, in combination with a breech-bolt, provided with a locking-pin having its lower end adapted to engage and rock said carrier to cause it to receive a cartridge and carry it into position to be loaded into the barrel of the gun.

4. In a repeating rifle of the character described, a pivoted carrier or lifter, in combination with a breech-bolt, provided with a locking-pin having its lower end adapted to engage and rock said carrier to cause it to receive a cartridge and carry it into position to be loaded into the barrel of the gun and a breech-bolt arranged to be moved to load the cartridge into the barrel.

809,095. OVERLAY. CLARK W. COBBS, Washington, D. C. Filed Oct. 7, 1904. Serial No. 227,602.



Claim.—1. The herein-described method of making overlays, which consists in forming depressions in the overlay-surface by the printing-surface under pressure, inking the printing-surface with suitable material, transferring the material from the printing-surface to the bases of the depressions by bringing the overlay and printing surfaces into contact, removing the portion of the overlay-surface not covered by the material to produce elevations on said overlay-surface in lieu of the former depressions, and finally removing said material.

2. An overlay having elevations and depressions, said elevations coinciding in places and positions with the places and positions of the elevations of its respective printing-surface.

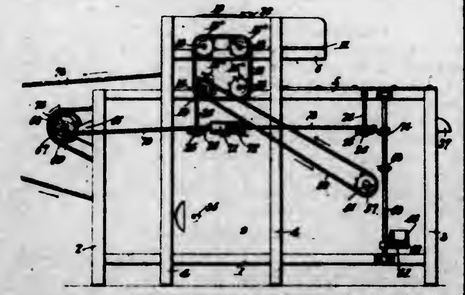
809,096. WIRE-STRETCHER. ISHAM A. OWENS, Channing, Tex. Filed May 19, 1905. Serial No. 261,185.

Claim.—1. In a machine for the purposes described, the combination of a frame, a reel journaled therein, rollers at one end of said frame adapted to have the wire pass thereover, means on said reel adapted to have the ends of the wire secured thereto, and a removable roller located intermediate of said first-mentioned rollers, substantially as described.

2. In a machine for twisting wire for the purposes described, the combination with a frame, of a reel carried therein and provided with means adapted to have the wire secured thereto, said frame being constructed to allow the wire to lead to said reel at substantially right angles to said reel and an element in said frame for causing the twist in said wire to occur outside of said frame.

3. In a machine for twisting wire for the purposes described, the combination with a frame, of means carried therein for stretching a wire, said frame being constructed to lead said wire to said wire-stretching means at substantially a right angle to the line of said wire, and an element in said frame for causing the twist in said wire to occur outside of said frame, substantially as described.

809,097. PEANUT-THRESHER. JOHN T. DELK, Ivor, Va. Filed Dec. 26, 1904. Serial No. 238,679.



Claim.—1. A casing, shafts journaled in the sides of said casing at the four corners of a square around a vacant space, toothed cylinders upon said shafts, a hood extending over the top and one end of the casing, a feed-board at the opposite end of said casing, and means for rotating the several cylinder-carrying shafts in the same direction.

2. A casing, a plurality of shafts journaled in the sides of said casing at the four corners of a square around a vacant space, toothed cylinders upon said shafts, a hood extending over the top and one end, a feed-board at the opposite end of the casing in horizontal alinement with one of the upper cylinder-carrying shafts, and a plurality of comb-teeth extending forwardly and rearwardly from the front edge of the hood.

3. A casing, a plurality of shafts journaled in the sides of said casing at the four corners of a square around a vacant space, a feed-board disposed in horizontal alinement with one of the upper cylinder-carrying shafts, a hood extending and terminating above said shaft, a comb extending downwardly and rearwardly from the front edge of said hood, a cross-piece disposed in rear of the lower rear cylinder-carrying shaft, a comb extending forwardly and downwardly from said cross-piece, and a reciprocatory sieve disposed below the cylinder-carrying shafts.

4. A casing, a plurality of shafts journaled in the sides of said casing at the four corners of a square around a vacant space, cylinders upon said shafts having intercurrently-disposed teeth cooperating with each other, a reciprocatory sieve disposed below the cylinders to receive the discharge therefrom, a feed-board to supply material to one of the upper cylinders, a comb disposed above and cooperating with said upper cylinder to prevent material from passing back over said cylinder, and a comb disposed to cooperate with one of the lower cylinders to prevent material discharged from returning into the space between said cylinders.

5. A casing, shafts journaled in the sides of said casing, said shafts being disposed at the four corners of a square, means for rotating said shafts in the same direction, toothed cylinders upon the said shafts, a feed-board disposed in alinement with one of the upper shafts, a reciprocatory sieve disposed below the lower shafts, a comb disposed above and cooperating with the toothed cylinder upon the shaft adjacent to the feed-board, and a comb having downwardly-extending teeth supported to cooperate with the cylinder diagonally opposite to the cylinder adjacent to the feed-board.

6. In a machine of the class described, beating and disintegrating mechanism comprising a plurality of cylinders having intercurrently-disposed teeth cooperating with each other, means for rotating said cylinders in the same direction, a reciprocatory sieve below said cylinders, and an inclined chute extending beneath and connected with said sieve.

7. In a machine of the class described, an imperforate semicylindrical receptacle having an overflow, a shaft mounted for rotation concentrically therewith, and stemming-blades upon said shaft, said stemming-blades terminating in hook-shaped points.

8. A stemming-trough, means for directing a current of air immediately over the trough, and stemming-arms movable therein; said trough having an overflow-plate hingedly connected therewith; and means to vibrate the plate.

9. A stemming-trough, means for directing a current of air immediately over the trough, and stemming-arms movable therein, said trough having hingedly connected therewith a vibratory overflow-plate provided with outwardly-extending fingers; and means for directing an air-current beneath the trough and between the fingers.

10. A stemming-trough and stemming-arms movable therein, said trough having hingedly connected therewith a vibratory overflow-plate provided with outwardly-extending fingers, and an air-deflecting member supporting the free edge of said plate to direct a current of air between the fingers.

11. In a machine of the class described, a semicylindrical receptacle, a shaft mounted for rotation concentrically therewith and stemming-blades upon said shaft, said stemming-blades having incisions in their downgoing edges forming sharp-pointed teeth, and terminating in hook-shaped points at their free extremities.

12. In a machine of the class described, a trough or casing, a shaft mounted for rotation, concentrically therewith, stemming-blades upon said shaft, having hooks at their outer extremities and provided with sharp-pointed teeth upon their downgoing sides, a discharge-chute disposed below the trough or casing, a deflector disposed to receive the overflow from the latter and deposit the same upon the discharge-chute, and means for directing an air-blast against said deflector.

13. An imperforate receptacle having an overflow, a shaft mounted for rotation in said receptacle, and stemming-blades upon said shaft, said blades having hooked extremities and sharp points to engage the stems and to remove the latter by dragging them through the contents of the receptacle, causing said contents to overflow at the upgoing sides of the stemming-blades.

14. A receptacle, a shaft mounted for rotation in said receptacle, stemming-blades upon said shaft, means for supplying material to the receptacle at one side of the shaft, an inclined plane extending from the edge of the receptacle at the opposite side of the shaft, a discharge-chute, a deflector disposed to conduct material overflowing from the receptacle over the inclined plane to the discharge-chute, and means for directing an air-blast against said inclined plane.

15. In a machine of the class described, a trough or casing, a shaft mounted for rotation, concentrically therewith, stemming-blades upon said shaft, having hooks at their outer extremities and provided with sharp-pointed teeth upon their downgoing sides, a discharge-chute disposed below the trough or casing, a vibratory plate connected hingedly with the rear upper edge of the trough, a deflector disposed to receive the overflow from the latter and deposit the same upon the discharge-chute, and means for directing an air-blast against said deflector.

16. In a machine of the class described, a trough or casing, a shaft mounted for rotation, concentrically therewith, stemming-blades upon said shaft, having hooks at their outer extremities and provided with sharp-pointed teeth upon their downgoing sides; a discharge-chute disposed below the trough or casing, a vibratory plate having spaced fingers at its lower edges, said plate being hingedly connected with the rear, upper edge of the trough, a deflector disposed to receive the overflow from the latter and deposit the same upon the discharge-chute, and means for directing an air-blast against said deflector.

809,098. SPRING-ROLLER FOR WINDOW-SHADES. HAROLD R. DEBEY, Jerseyville, Ill., assignor to Sylvanus L. Hill, Jerseyville, Ill. Filed May 2, 1905. Serial No. 258,288.

Claim.—1. The combination of a roller having a spring-controlled pintle, a roller-bracket having a bearing-opening in which the pintle is capable of turning, and a combined winding and locking crank pivotally carried by the pintle and capable of being turned into engagement with the roller-bracket to prevent rotation of the pintle.

2. The combination of a roller having a spring-controlled pintle, a roller-bracket having an opening in which the pintle is capable of turning, and a combined winding and locking crank straddling the outer end of the pintle and pivotally connected thereto and also capable of being turned into locked engagement with the bracket to prevent rotation of the pintle.

3. The combination of a roller having a spring-controlled pintle, a roller-bracket having an opening in which the pintle is capable of turning and also provided with a seat, and a combined winding and locking crank pivotally carried by the pintle to swing from one side to the other and having a projection capable of entering the seat in the bracket to lock the pintle against rotation.

4. The combination of a roller having a spring-controlled pintle, a roller-bracket having a bearing-opening in which the pintle is capable of rotating and also provided with a seat, and a combined winding and locking crank straddling the outer end of the pintle and capable of being turned from one side to the other thereof, the crank being provided with a projection capable of engaging the seat of the bracket to lock the pintle against rotation.

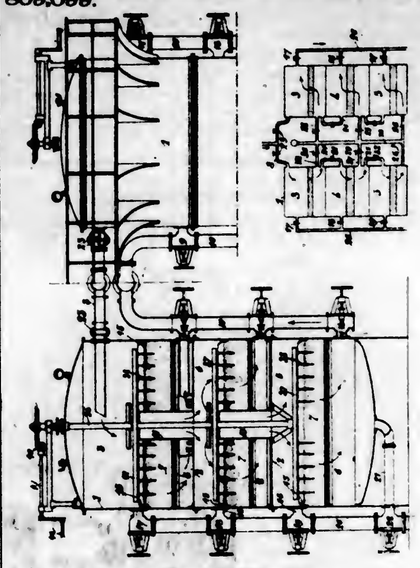
5. The combination of a roller having a spring-controlled pintle, a bracket having an opening in which the pintle is capable of rotating, a combined winding and locking crank pivotally carried by the pintle and capable of being turned into locked engagement with the bracket, and a helical spring embracing the pintle between the bracket and the roller and bearing against these members to maintain the roller at the limit of its endwise movement away from the bracket to hold the crank in engagement with the bracket.

6. The combination of a roller having a spring-controlled pintle, a bracket having an opening in which the pintle is capable of rotating, a combined winding and locking crank pivotally carried by the pintle and capable of being turned into locked engagement with the bracket, and a spring to maintain the roller at the limit of its endwise movement from the bracket to detachably maintain the crank in locked engagement with the bracket.

809,099. FILTERING, PURIFYING, AND DECANTING APPARATUS. HENRI DOMINJAN, Paris, France. Filed Apr. 5, 1905. Serial No. 254,006.

Claim.—In a filter with supply-pipe at the top having a number of superposed filtering-compartments, separated by closed bottoms, the combination of revolving stirring-bars above the filtering strata with fingers depending from said bars into the filtering material, of perforated sheets carrying the filtering strata, and secured above the separating-bottoms of the compartments, of overflow-pipes passing centrally through the perforated sheets and the separating-bottoms to connect a compartment with the adjacent compartment below, of valved outlet-pipes branching off from each compartment near the bottom and of valved outlet-pipes communicating with the compartments at a point above the top surface of the filtering layer, substantially as described and for the purpose set forth.

809,099.



809,100. HOLLOW ROLL PASTRY. FRIEDRICH DIENER, London, England. Filed Nov. 11, 1905. Serial No. 286,903.

Claim.—Hollow roll pastry consisting of an inner flanged cylindrical roll and an outer cylindrical roll connected together by the flanges concentrically with nearly semicylindrical spaces between the two rolls and filling material occupying the said spaces the inner roll consisting of two superimposed semicylindrical troughs flanged at their longitudinal edges and connected together by the flanges and the outer roll consisting of two nearly semicylindrical troughs connected at their longitudinal edges to the faces of the flanges of the inner roll.

809,101. PROCESS OF MAKING STABLE NON-ALCOHOLIC IRON COMPOUNDS. KARL DIETERICH, Helfenberg, Germany. Filed Oct. 15, 1904. Serial No. 228,694.

Claim.—1. The herein-described process of producing stable non-alcoholic organic iron compounds and organic iron-manganese compounds of the character described, which consists in dissolving in distilled water an unstable organic iron compound and acidifying the same with hydrochloric acid, then cooling this acidulated solution to 0° centigrade, then forcing into it carbonic acid under a pressure of about six atmospheres and keeping it under such pressure for a time approximating two to three months.

2. The herein-described process of producing stable non-alcoholic iron compounds and organic iron-manganese compounds of the kind described, which consists in dissolving in water an unstable organic iron compound, then cooling this solution to 0° centigrade, then forcing into it carbonic acid under a heavy pressure, and keeping it under such pressure for a considerable space of time.

809,102. PIPE TONGS OR WRENCH. EDWARD DUGGINS, Oliver Springs, Tenn., assignor of one-half to John R. Richards, Oliver Springs, Tenn. Filed Sept. 12, 1905. Serial No. 278,169.

Claim.—In a wrench, the combination of a straight fixed jaw provided with two toothed recesses, and a concaved toothed face extending from the outermost recess to the back of the straight jaw; a pivoted adjustable jaw of arcuate shape having part of its inner face adapted to cooperate with the outer face of the fixed jaw; said toothed recesses of fixed jaw adapted to cooperate with the inner

face of the adjustable jaw when said adjustable jaw is adjusted with relation to the recesses, and means for adjusting the pivoted jaw with relation to the fixed jaw.

809,103. SKATE. WILLIAM H. DUNER, Toronto, Canada. Filed Dec. 3, 1904. Serial No. 235,967.

Claim.—1. A skate comprising a hollow support, quadrilateral in cross-section, and having its lower ends converged to form vertical portions, the said quadrilateral support being placed so that one of its corners forms the apex which is directly above the space between said vertical portions, the other corners of said support forming side ribs; the runner held between said vertical portions and extending a sufficient distance therebelow, and a horizontal brace secured within said support and in the inner corners formed by said side ribs.

2. A skate comprising a hollow support, quadrilateral in cross-section, and having its lower ends converged to form vertical portions, the said quadrilateral support being placed so that one of its corners forms the apex which is directly above the space between said vertical portions, the other corners of said support forming side ribs; the runner held between said vertical portions and extending a sufficient distance therebelow, and a horizontal brace secured within said support and in the inner corners formed by said side ribs, the side edges of said brace being turned so as to increase the soldering area between said inner corners and said brace.

3. A skate comprising a hollow support, quadrilateral in cross-section, and having its lower ends converged to form vertical portions, the said quadrilateral support being placed so that one of its corners forms the apex which is directly above the space between said vertical portions, the other corners of said support forming side ribs; the runner held between said vertical portions and extending a sufficient distance therebelow; a horizontal brace secured within said support and in the inner corners formed by said side ribs, the heel and sole cups provided with quadrilateral-shaped slots embracing said support and secured thereto, and the heel and sole plates secured to their respective cups.

4. The combination of the sole-plate provided with a first and second flange-bed and an opening provided with a downwardly-extending flange; a hollow cup fitting in said opening and provided at its top with an outwardly-flared flange which rests in said second flange-bed, the downwardly-extending flange of said sole-plate being secured to the outside of said hollow-cup, and the sole-plate-strengthening plate resting in said first flange-bed thus providing said sole-plate with a flat surface; the said sole-plate-strengthening plate being provided with a central hole which has a downwardly-turned flange which overlaps the outwardly-flared flange of said hollow cup and extends a suitable distance down thereinto, the said parts being suitably secured together.

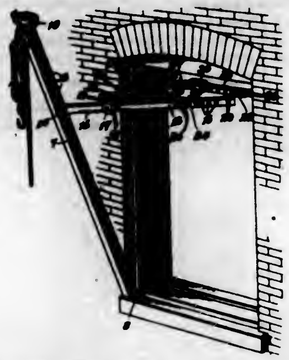
809,104. WINDOW-CRANE. THOMAS H. PERSON, Davenport Iowa. Filed Nov. 28, 1904. Serial No. 234,506.

Claim.—1. In a window-crane, the combination with a single supporting-mast having a sill-engaging foot at its lower end, of means connected to the mast above its lower end for attaching the same to a window-frame and holding it against movement with respect thereto, and means for suspending elevating mechanism from the mast.

2. In a window-crane, the combination with a single supporting-mast formed of angle-iron, the flanges of which form at their lower ends a corner-receiving seat, one of said flanges being longer than the other and outturned to form a foot, of means for attaching the mast against movement to a window-frame, and means for suspending elevating mechanism from the upper end of the mast.

3. In a window-crane, the combination with a support having its lower end arranged to rest upon a sill, of an arm connected to and adjustable longitudinally of the support between the ends thereof, and means for securing the arm to a window or analogous frame.

4. In a window-crane, the combination with a supporting-mast having a sill-engaging lower end and having a longitudinal series of openings, of an arm, a fastening device for the arm arranged to be passed through any of said openings, and means for detachably securing the arm to a window or analogous frame.



5. In a window-crane, the combination with a support, of an arm connected to the support, and means for securing the arm to a frame, said means including a carrier slidable upon the arm, and a jaw pivoted to the carrier and movable therewith.

6. In a window-crane, the combination with a support, of an arm connected to the support and having a rack, and means for securing the arm to a frame, said means including a carrier slidable upon the arm and having a device engaging the rack to hold the carrier against movement, and a jaw carried by the carrier.

7. In a window-crane, the combination with a supporting-mast, of an arm connected thereto and having a rack, a carrier comprising side plates that embrace the arm, and connections between the plates, one of said connections adjustably engaging the rack, and a jaw pivoted to the carrier and arranged to bear against a window or other analogous frame.

8. In a window-crane, the combination with a support, of an arm connected thereto and having a longitudinal series of openings therethrough, a jaw having a portion that lies alongside the arm, and fastening means for the jaw arranged to be passed through said portion and the openings in the arms.

9. In a window-crane, the combination with a support, of an arm connected thereto, and coacting frame-embracing jaws both adjustable longitudinally on the arm and movable toward and from each other.

10. In a window-crane, the combination with a mast, of an arm pivoted to the mast and having a rack and a longitudinally-disposed series of openings, a carrier slidably mounted on the arm and having an element that engages the rack, a jaw mounted on the carrier, another jaw, and means for adjustably securing the latter jaw to the arm, said means being arranged to be passed through the different openings in the arm.

11. In a window-crane, the combination with a support, of means for attaching the same to and holding it upon the side of a window-frame, and retaining means detachably connected to said attaching means and arranged to engage the opposite side of the frame.

12. In a window-crane, the combination with a support, of means for attaching the same to the side of a window-frame, said means including a frame-engaging jaw, and a retaining-bar having one end adapted to interlock with the jaw and its other end adapted to bear against the opposite side of the frame to that engaged by the jaw.

13. In a window-crane, the combination with a support, of means for attaching the same to the side of a window-frame, said means including a frame-engaging jaw, and a retaining-bar having one end to interlock with the jaw and having a frame-engaging foot at its other end that is adapted to bear against the opposite side of the frame to that engaged by the jaw.

14. In a window-crane, the combination with a support, of means for attaching the same to the side of a window-frame, said means including a frame-engaging jaw having an eye, and a sectional extensible retaining-bar having a pin at one end that engages the eye and a foot at its other end that is arranged to bear against the opposite side of the frame to that engaged by the jaw.

15. In a window-crane, the combination with a supporting-mast formed of angle-iron and having a tackle-engaging ring at its upper end and a sill-engaging foot at its lower end, of an arm pivotally and adjustably connected to the mast, frame-embracing jaws engaging the arm and relatively adjustable, the inner of said jaws having an eye, a retaining-bar comprising pivotally-connected sections, one of said sections having a pin that engages in the eye, the other having a foot that bears against the side of the frame opposite to that engaged by the jaws, and means for holding the sections against pivotal movement.

16. In a window-crane, the combination with a support, of an arm connected thereto, coacting frame-embracing jaws both adjustable longitudinally on the frame and movable toward and from each other, and means for securing both jaws in different positions upon the arm.

809,105. ATTACHMENT FOR HORSESHOES. JOHN P. GROUSE, Sandusky, Ohio. Filed May 16, 1905. Serial No. 260,657.

Claim.—1. An attachment for a horseshoe, consisting of a bow adapted to be applied to the inner edge of said shoe and carrying calks, saddles adapted to grip said bow at opposite sides of said shoe, affording means for securing said bow to said shoe, and a connection between said saddles for forcing the same apart.

2. An attachment for a horseshoe, comprising a bow conforming substantially to the inner edge of the shoe, said bow having extensions projecting below said shoe at the rear portion thereof, said extensions being bent outwardly and rearwardly to form calks with curved forward portions and rearwardly-projecting spurs, the upper edge of said calks resting against the under face of said shoe, and means for securing said bow to said shoe.

809,106. WALL-MOLD. JOHN H. GEER, Waynesboro, Pa. Filed Sept. 22, 1905. Serial No. 279,702.

Claim.—1. In a wall-mold, the combination, with uprights, and means for securing them to a wall, of horizontal supporting-bars secured between the said uprights, and a molding-box which rests on the said bars.

2. In a wall-mold, the combination, with uprights, and means for securing them to a wall, of horizontal supporting-bars provided with brackets at their ends which are slidable vertically on the said uprights, means for securing the said brackets in position, and a molding-box which rests on the said bars.

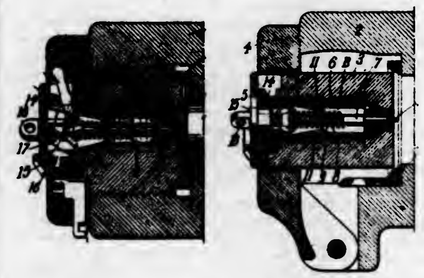
3. In a wall-mold, the combination, with uprights arranged in pairs and provided with clamping devices for securing them to a wall, of horizontal supporting-bars secured between the said uprights, and a molding-box which rests on the said bars.

4. In a wall-mold, the combination, with a molding-box provided with detachable ends, of clamping-bars the lower portions of which engage with the sides of the said box, an inclined distance-bar pivoted between the upper end portions of the said clamping-bars, and a clamping-screw engaging with the middle portions of the said bars.

5. In a wall-mold, the combination, with a molding-box, of a core, a vertical shaft journaled in the core and provided with a cross-piece inside the core, and retractable supporting-bars pivoted to the said cross-piece at one end and having their free end portions slidable in guide-holes in the core.

6. In a wall-mold, the combination, with a molding-box, of a core of greater depth than the said molding-box, a vertical shaft journaled in the core and provided with a cross-piece on its lower end portion inside the core, and retractable supporting-bars for the core pivoted at one end to the said cross-piece and having their other end portions slidable in guide-holes in the core.

809,107. FIRING MECHANISM FOR BREECH-LOADING GUNS. GREGORY GERDON, Watervliet, N. Y., assignor to Ordnance Improvement Company, a Corporation of New York. Filed Jan. 26, 1903. Serial No. 140,082.



Claim.—1. In combination, the gun, the block rotatable therein, the non-rotating core in the block eccentric with the axis of the gun, and the firing-pin disposed eccentrically in said core.

2. The combination of the rotatable block, the firing element, and the core eccentric with the gun's axis, said block and core having relative movement.

3. The breech mechanism comprising in combination with the gun, an interrupted-thread block, a non-rotating core eccentric with the gun's axis upon which the block rotates, and a firing-pin eccentrically disposed in said core.

4. In a breech-loading gun, in combination, a rotatable breech-block, a firing element, a support for said element upon which said block rotates, and means actuated by the rotation of the block for preventing the pin if actuated from making contact with the cartridge-primer except when the block is closed.

5. In a breech-loading gun, in combination, a rotatable breech-block, a non-rotating core disposed in said block eccentrically to the gun's axis, a firing-pin and a guide for the pin-point automatically shiftable into and out of alinement with the axis of the gun.

6. In a breech-loading gun, the combination with its breech-block, of a firing-pin having longitudinal support therein, and means for moving it longitudinally and laterally in said block.

7. In a breech-loading gun, the combination with its breech-block, of a firing element, a non-rotating support for said element disposed longitudinally in said block, a guide for the point of said element and means for automatically moving said guide laterally with relation to the gun's axis.

8. In a breech-loading gun, the combination with its breech-block, of a primer detonating element and means longitudinally disposed in said block for automatically shifting said element laterally therein.

9. In a breech-loading gun, the combination with its breech-block, of a firing-pin, a non-rotating firing-pin guide longitudinally disposed in said block, means for reciprocating the pin, and means for shifting its point laterally as the block is rotated.

10. In a breech-loading gun, the combination with its breech-block, of a firing-pin having a guide-support longitudinally disposed in said block, the firing-pin point being in alinement with the axis of the gun when the block is in closed position, means for moving said support to shift the firing-pin laterally in the block when the latter is turned from closed position, and means for reciprocating said pin.

11. In a breech-loading gun having a concentric, rotatable breech-block, a firing-pin working in said block, and a guide for said pin longitudinally disposed in said block adapted to hold its point out of alinement with the axis of the gun except when the block is in closed position.

12. In a breech-loading gun, in combination with a concentrically-arranged, rotatable breech-block, a firing-pin, and means disposed longitudinally of said block and actuated by its rotation, for shifting the firing-pin point from concentric position in said block.

13. In a breech-loading gun, the combination with the rotatable breech-block and its firing-pin, of the non-rotating firing-pin support arranged eccentrically in said block, and adapted to center said pin in said block when the latter is in firing position, and to shift said pin to eccentric position therein when the block is turned from firing position.

14. In a breech-loading gun, the combination with its breech-block, of a firing-pin having a support longitudinally disposed in said block, the firing-pin being concentric with the bore of the gun when the block is in firing position, and means for moving said support to shift the firing-pin transversely of the axis of said block when the latter is turned from firing position.

15. In a breech-loading gun having a concentric, rotatable breech-block, a firing-pin carried by said block, and means supporting said firing-pin, longitudinally disposed in said block, and adapted to hold said pin eccentric with the bore of the gun except when the block is fi closed or firing position.

16. In a breech-loading gun having a concentrically-arranged, rotatable breech-block, the combination of a firing-pin working in said block and means actuated by the rotation of the block and longitudinally disposed in the same for automatically moving said firing-pin from concentric to eccentric position in said block.

17. In a breech-loading gun having a breech-block with interrupted thread, a firing-pin and firing-pin sleeve or support carried by said block, the sleeve being arranged eccentric in said block and the pin equally and oppositely eccentric in the sleeve.

18. In a breech-loading gun, having a concentric, rotatable breech-block, a firing-pin and means fitted longitudinally in said block capable of automatically moving the pin with respect to said block from eccentric to concentric position.

19. In a breech-loading gun, in combination with its rotatable breech-block, a firing-pin, a pin-support arranged longitudinally in the block, and means capable of automatically moving the pin with respect to the breech-block from eccentric to concentric position.

20. In a gun of the class described, in combination, an interrupted-thread breech-block, a firing mechanism, a longitudinal support for said mechanism arranged in said block, one being movable relatively to the other, and means constituting a functional barrier to said mechanism.

21. In a gun of the class described, in combination, an interrupted-thread breech-block, a firing-pin, a pin-support mounted longitudinally in the block, one being movable relatively to the other, and means constituting a functional barrier shiftable into the normal path of the pin-point.

809,108. APPARATUS FOR DETACHING THE HEADS FROM THE BODIES OF SHEET-METAL CANS. STANLEY K. GREEN, Baltimore, Md. Filed Aug. 4, 1903. Serial No. 168,236.

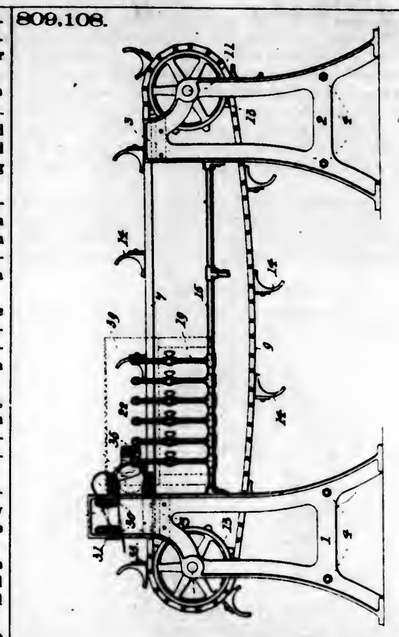
Claim.—1. In an apparatus for detaching the heads from the bodies of soldered sheet-metal cans, the combination of heaters, mechanism to convey the cans between the said heaters whereby the solder in the head-joints is liquefied, and devices to separate the heads from the bodies while the said solder is in a melted condition, substantially as specified.

2. In an apparatus for detaching the heads from the bodies of soldered sheet-metal cans, the combination of heaters, a conveyer to carry the cans to and from the said heaters, detaching devices to separate the heads from the bodies while the solder in the joint is heated to a liquefied condition, and a centering appliance whereby the cans are accurately presented to the head-detaching devices, substantially as specified.

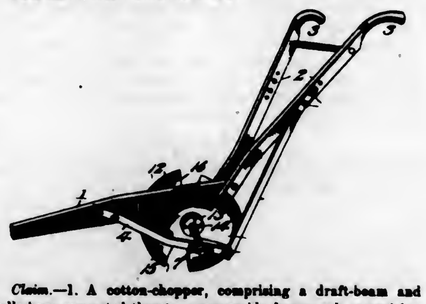
3. In an apparatus for detaching the heads from the bodies of soldered sheet-metal cans, the combination of a movable endless conveyer-chain, segmental can holders or carriers attached to the said endless chain, heating appliances between which the endless chain conveys the cans, and flaring head-detaching blades which in the movement of the cans pass between the flanged heads thereof and separate them from the bodies, substantially as specified.

4. In an apparatus for detaching the heads from the bodies of soldered sheet-metal cans, the combination of a movable endless conveyer-chain carrying can-holders, a heater at each side of the said endless chain, and head-detaching appliances which comprise devices to compress the can-bodies between the heads thereof or distort them from a cylindrical form while the solder is in a liquefied condition, substantially as specified.

809,108.



809,109. COTTON-CHOPPER. JAMES W. HAYNIE, Fairburn, Ga. Filed Mar. 7, 1905. Serial No. 248,900.



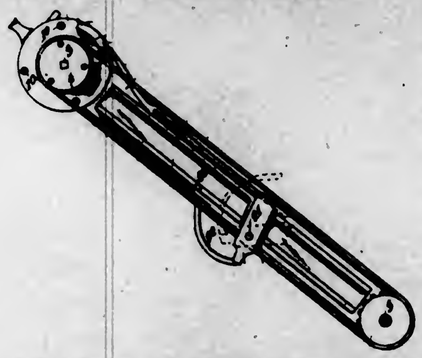
Claim.—1. A cotton-chopper, comprising a draft-beam and handle-bars connected thereto, a removable framework comprising brace-bars connected to the beam, supporting-bars connected to the handle-bars and to the ends of the brace-bars, and hanger-straps depending from the beam, shafts supported in the hanger-straps and brace-bars, said shafts inclining downwardly and forwardly from the beam, and a cutting-disk fixed on each of said shafts.

2. A cotton-chopper comprising a draft-beam and handle-bars connected thereto, brace-bars connected to the beam and extending downwardly and rearwardly therefrom, supporting-bars adjustably connected to the handle-bars and to the brace-bars, shafts supported at their outer ends in said brace-bars, a cutting-disk fixed on each of said shafts, and means depending from the beam to support the inner ends of said shafts.

809,110. SAFETY ATTACHMENT FOR GAGES. ISAAC W. HOUGHTON, HENRY C. DUBOIS, and ARDEN VAN VOORHEES, Marshall, Mich. Filed Aug. 28, 1905. Serial No. 276,251.

Claim.—1. In combination, a gage-tube, a valve governing the supply of gaged medium to said tube, a ratchet-plate connected with said valve, means normally tending to close the valve, a ratchet-lever arranged to engage the ratchet-plate to hold the same in such position that the valve is open, and a pressure-lever bearing against the gage-tube and coacting with the ratchet-lever, whereby when the gage-tube is broken, the pressure-lever will permit movement of the ratchet-lever to permit closing of the valve.

2. In combination, a gage-tube, a valve governing the supply of the gaged medium to said tube, a ratchet-plate revolubly with said valve, a spring coacting with said plate and normally tending to close the valve, a ratchet-lever arranged to engage the ratchet-plate to hold the same in such a position that the valve is open, and a pressure-lever pivoted between its ends and having one end in engagement with the gage-tube and the opposite end in engagement with the ratchet-lever, said pressure-lever being operable on breakage of the gage-tube to permit movement of the ratchet-lever to release the ratchet-plate and permit closing of the valve aforesaid.



3. In combination, a gage-tube, valves governing admission of the medium to be gaged to said tube, a ratchet-plate connected with the stem of one of the valves and revolubly therewith, a spring connected with said ratchet-plate and normally tending to hold the valve adjacent thereto closed, a pivotally and slidably mounted ratchet-lever having one end thereof in engagement with the ratchet-plate, a pressure-lever pivoted between its ends and having one end engaged with the opposite end of the ratchet-lever, and an endless connection between the valves aforesaid, whereby when the gage-tube is broken the pressure-lever will release the ratchet-lever and permit simultaneous closing of the valves under the action of the spring aforesaid.

4. In combination, a gage-tube, a valve therefor, a spring for actuating said valve, a ratchet-plate coacting with the spring, a ratchet-lever engaging the ratchet-plate to hold the spring under tension, and a pressure-lever coacting with the gage-tube and the ratchet-lever and operable on breakage of the gage-tube to permit closing of the valve under actuation of the spring.

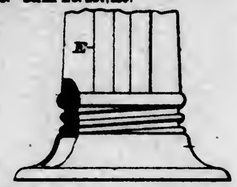
5. In combination, a gage-tube, a valve therefor, a spring for actuating said valve, a ratchet-plate coacting with the spring, a longitudinally-slidable ratchet-lever engaging the ratchet-plate to hold the spring under tension, and a pressure-lever coacting with the gage-tube and the ratchet-lever and operable on breakage of the gage-tube to permit closing of the valve under actuation of the spring.

809,111. MINER'S-LAMP SAFETY-SHIELD. RICHARD I. JENKINS, Lowistown, Mont., assignor of one-fourth to B. F. Marsh, Lowistown, Mont. Filed May 20, 1905. Serial No. 261,294.

Claim.—1. In a device of the character described, a shield having a plurality of openings therethrough near its upper end and an opening therethrough near its lower end, a sleeve surrounding said opening, a trough carried by the lower end of the shield, a horizontal flexible projection carried by the shield at its lower end to hold the same against upward movement, and a semicircular support secured to the back of the shield to hold the same against sidewise or tilting movement.

2. In a device of the character described, the combination, with a miner's lamp, of a vertical shield having an opening therethrough near its lower end, a sleeve carried by the shield and surrounding the opening, a semicircular support carried by the back of the shield to engage the body of the lamp and hold the shield against tilting or sidewise movement, and a horizontal flexible projection carried by the lower end of the shield and adapted to engage the bottom of the lamp to hold the shield in normal position.

809,112. LAMP-BURNER. DOLPHIS JOYAL, Lowell, Mass. Filed June 28, 1905. Serial No. 267,439.

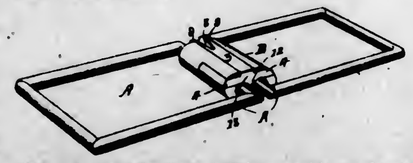


Claim.—1. In a lamp-burner, a perforated horizontal platform, comprising a central cone having a screw-threaded upper rim, a metal collar adapted to screw on said cone, an extended transparent tube formed with a transverse slot at its top, and an extended wick-tube as described.

2. In a lamp-burner, a perforated horizontal platform, comprising a central cone having a screw-threaded upper rim, a metal collar adapted to screw on said cone, an extended transparent tube beaded at its bottom rim to form a gripping edge for said collar and hemispherical at its top with a transverse slot with rounded edges, and an elongated wick-tube as described.

3. In a lamp-burner, a perforated horizontal platform, comprising a central cone having a screw-threaded upper rim, a metal collar adapted to screw on said cone, an extended transparent tube beaded at its bottom rim to form a gripping edge for said collar and hemispherical at its top with a transverse slot with rounded edges, and an elongated wick-tube, the outer surface of which is adapted to reflect light, as described.

809,113. CHAIN. JAMES M. JOYCE, Edgerton, Wis. Filed June 12, 1905. Serial No. 264,910.



Claim.—1. A coupling for chain-links, comprising an elongated body portion slotted throughout its length on one face, and having recesses to receive the chain-links, and a block fitting in the slotted face of said body with its outer face flush with the outer face of the body, and means carried by said block when engaging the body for securing the block in engagement with the body.

2. A coupling for chain-links, comprising a body slotted throughout its length on one face, and having recesses to receive the chain-links, said body also having cut-away portions at one end, and a block fitting in the slotted face of the body and having side portions fitting in the recesses in the end of the body and means for securing said block in locked engagement in the body.

3. A coupling for chain-links, comprising a body slotted throughout its length on one face, and having interior recesses, and having recesses in one end, a block fitting in the slotted face of said body and having side portions fitting in the end recesses of the body, the underneath face of said block having longitudinal recesses registering with the chain-receiving recesses of the body, and means for securing the block in locked engagement with the body.

4. In combination with a pair of adjacent chain-links, a connection therefor, embodying a body portion and a locking element, said body portion being formed with a recess corresponding in shape to said locking element, said locking element being seated in said recess, and having its outer surface lying flush with the periphery of the body portion, the ends of said locking element being split and adapted to be spread apart into locking engagement with said body portion.

5. In combination with a pair of adjacent chain-links, a coupling therefor, embodying a body portion formed with a central bore, and a T-shaped opening, and a T-shaped locking element carried by said body portion and interfitting in said T-shaped opening, said locking element having its end formed with furcations adapted to be spread apart into locking engagement with the body portion.

6. In combination with a pair of adjacent chain-links, a connection therefor, embodying a body portion formed with a central bore and a T-shaped opening, and a T-shaped locking element interfitting in said opening and provided with a bifurcated end terminating in enlarged shoulders, adapted to be spread apart into locking engagement with said body portion.

7. In combination with a pair of adjacent chain-links, and connection therefor, embodying a body portion formed with a central bore, and a T-shaped opening, and a T-shaped locking element carried by said body portion and interfitting in said opening, said locking element being formed adjacent its end with a split portion adapted to be spread apart into locking engagement with said body portion.

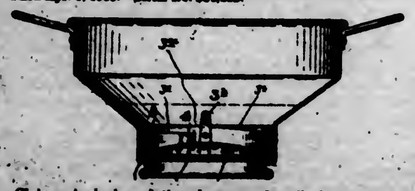
809,114. **RAZOR-STROP.** OTTO KAMPFE and FREDERICK KAMPFE, New York, N. Y. Filed Feb. 11, 1904. Serial No. 193,143.

Claim.—1. A razor-strop provided with a bail or handle comprising a core-wire, and a covering of resilient coiled wire, the convolutions of which are closely wound and of an inner diameter greater than the diameter of said core-wire.

2. A bail or handle for razor-strops and the like, comprising a U-shaped core-wire, and a covering of closely-coiled resilient wire, the ends of said core being inwardly bent adjacent the ends of said coil, so as to crowd the convolutions of the same and to engage a strop or the like.

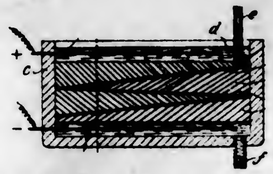
3. A razor-strop provided with a bail or handle comprising a core-wire, and a covering for said wire consisting of a resilient coil of wire the convolutions of which are greater in inner diameter than the diameter of said core-wire, the ends of said core being bent so as to crowd said convolutions and engage the strop proper.

809,115. **MILK-STRAINER.** AXEL A. C. KLINT, Holton, Kans. Filed Apr. 6, 1905. Serial No. 254,128.



Claim.—A device of the character described, comprising a hemispheric strainer-guard with its rim or wall practically constituting two semicircular members one in continuation of the other, said members having their upper edges forming opposite inclines with their perpendicular edges or elevations opposed to their bases, respectively, said members also being bodily deflected or bent inward into lateral recesses, and a fixed handle-bar or bail whose points of connection with said members are arranged upon opposite sides of the bases of said members, respectively, in combination with a receptacle having an annular portion effective to receive said strainer, and having inward-extended headed studs adapted to ride upon the edges of said members and to enter said recesses.

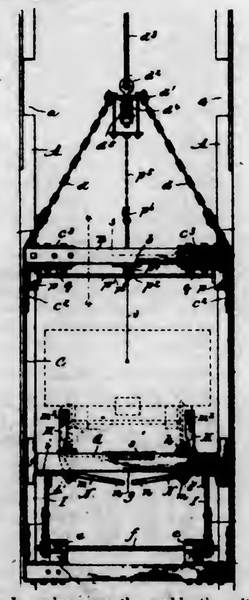
809,116. **METHOD OF PRODUCING CIRCULATION IN ELECTROLYTIC PROCESSES.** HUGO KELLER, Vienna, Austria-Hungary, and PAUL ASKENASY, Nuremberg, Germany. Filed Oct. 20, 1903. Serial No. 179,166.



Claim.—1. In the art of electrolysis by the diaphragm process, the method which consists in causing a flow of an electrolyte toward and into the cathode-chamber in a direction substantially at right angles to the line of diffusion.

2. In the art of electrolysis by the diaphragm process, the method which consists in causing a flow of an electrolyte from the anode-chamber into the cathode-chamber in a direction substantially at right angles to the line of diffusion.

809,117. **ELEVATOR.** GEORGE R. LAYMAN, Lincoln, Ill. Filed July 5, 1905. Serial No. 268,792.



Claim.—1. In a mine-cage, the combination with the uprights or guide-rails of the elevator-shaft having passage-ways therein, of the cage, a platform pivoted therein, vertically-disposed triangular plates supporting the platform, a rock-shaft to which the triangular plates are fixed and forming a pivot for said plates by which the platform may be tilted, shoes at the sides of the platform adapted to slide on the uprights and pass through the passage-ways thereof when the platform is tilted, dogs pivoted in the platform and adapted to engage the wheels of a car run thereon, a spring connecting the dogs to hold them upright or normally in engagement with such wheels, and operating-levers connected to the dogs for releasing them, substantially as shown and described.

2. In a mine-cage, the combination with the cage, of a platform

pivoted therein, dogs pivoted in the platform and adapted to engage the wheels of a car run thereon, said dogs comprising a bar bifurcated at its upper or free end to provide oppositely-curved engaging members, shafts to which said dogs are fixed and extending longitudinally under the platform, levers attached to the shafts near the ends thereof and projecting toward the center of the platform at opposite ends of the latter, arms projecting outwardly at the free ends of the levers, and a spring adapted to hold the dogs normally upright with the levers at a downward inclination, substantially as shown and for the purpose set forth.

809,118. **METHOD OF WEAVING.** LEON LEMBEUX, Paterson, N. J. Filed May 31, 1905. Serial No. 263,043.

Claim.—1. The method of weaving twin fabrics which consists in forming sheds in the warp, projecting the ground-filling through the sheds, and simultaneously projecting a single inside selvage-filling back and forth through first one portion and then the other portion of an interior section of the shed, substantially as described.

2. The method of weaving twin fabrics which consists in forming sheds in the warp, projecting the ground-filling through the sheds, and simultaneously projecting a single inside selvage-filling back and forth through first one portion and then the other portion of an interior section of the shed, the shed being changed after the projecting through of the selvage-filling in each direction, substantially as described.

3. The method of weaving twin fabrics which consists in forming sheds in the warp and at certain intervals raising, alternately, first the raised threads of the inside selvage-warps for one part of the fabric and then the raised threads of the inside selvage-warp for the other part of the fabric, higher than the remaining raised threads of the warp, projecting the ground-filling through the sheds, and simultaneously projecting a single inside selvage-filling back and forth between the more highly raised selvage warp-threads and the remaining threads of one shed alternately with the threads of the other shed, substantially as described.

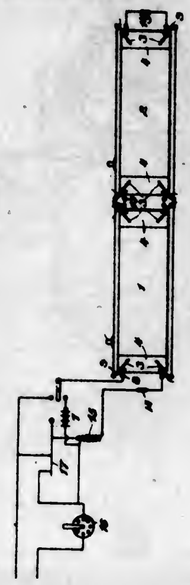
809,119. **FINGER-CURETTE.** MAXIMILIAN J. C. LEUCHS, New York, N. Y. Filed May 10, 1905. Serial No. 259,895.

Claim.—A finger-curette comprising a sleeve open at both ends, and a scraper overhanging one end of said sleeve and extending forwardly therefrom in line with the wall of the same, said scraper embodying a downwardly-disposed scraping edge.

809,120. **ELECTRIC RAILWAY.** CHARLES LEVINSON, New York, N. Y. Filed July 12, 1905. Serial No. 269,578.

Claim.—1. A safety device for preventing the starting of a car comprising a contact or switch located in the driving-motor circuit independent of the motorman's controller and associated with a gate of the car, said contact or switch being so arranged as to be opened and to cut off the current from the driving-motor independent of the motorman's controller when said gate is open, substantially as described.

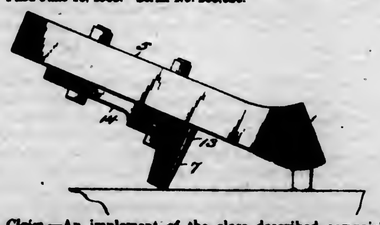
2. A safety device for preventing the starting of a train of cars which consists in locating a plurality of contacts or switches in the driving-motor circuit in every car of the train, said contacts or switches being independent of the motorman's controller and associated with the gates on the cars, said contacts or switches being so arranged as to be opened and to cut off the current from the driving-motor independent of the motorman's controller when any of said gates are opened, substantially as described.



809,121. **ILLUMINANT.** JULIUS LEWY, Frankfort-on-the-Main, Germany. Filed June 20, 1903. Serial No. 162,543.

Claim.—A wax-like non-transparent composition of matter, containing paraffin, stearin and alcohol so mixed therewith as to impart opacity to the mixture.

809,122. **SPIKE-PULLER.** LORENZO A. MILLIGAN, Barstow, Cal. Filed June 16, 1905. Serial No. 265,626.

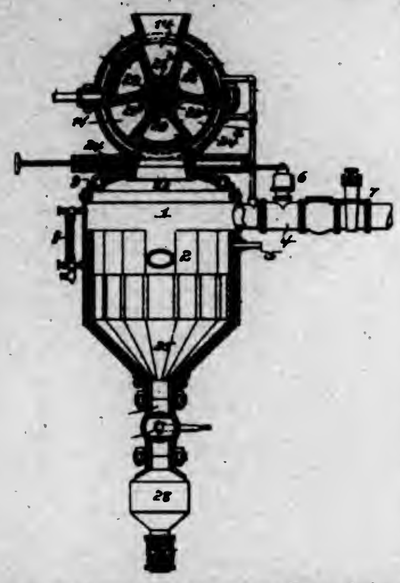


Claim.—An implement of the class described comprising a stock having a head at one end, said head having an upwardly and rearwardly slanted forward face and having a recess opening through its upper face, said head also having communicating slots in its forward and lower faces communicating with the recess, the walls of the slot in the forward face being sharpened at their upper portions, depending lips carried by the head at the sides of the slot in its bottom, said lips lying in a plane slightly below the bottom of the said head, a slotted rail-engaging foot on the stock, and headed bolts carried by said stock and engaging the slots formed in said rail-engaging foot.

809,123. **APPARATUS FOR GENERATING STEAM FROM HOT SLAG.** GEORGE MITCHELL, Los Angeles, Cal. Filed Dec. 13, 1904. Serial No. 236,768.

Claim.—1. The combination with a steam-generator having a feed-opening in its top and a casing over said generator and communicating therewith through said feed-opening, of a hollow slag-carrier having a series of radial slag-receptacles, a spout at the top of the casing, packing-rings between the slag-carrier and casing and

means for admitting steam into the hollow slag-carrier and subjecting the packing to the pressure thereof.



2. The combination with a steam-generator having a feed-opening in its top, of a slag-carrier over said feed-opening and having a horizontal axis of rotation, said carrier having a series of radiating slag-receptacles, each having a steam-duct in its bottom and means for forcing steam outwardly through said duct to eject the slag.

3. The combination with a steam-generator having an opening in its top, of a hollow rotary slag-carrier having a series of slag-receptacles and a chamber within the carrier, a casing inclosing the carrier, packing-rings on the carrier arranged to receive steam-pressure from said chamber, ducts communicating with said chamber in the carrier, a tubular hub for the carrier, central ducts connecting said tubular hubs with the bottoms of the slag-receptacles and with the chamber in the slag-carrier, a hollow journal on which the carrier rotates, said hollow journal having a port to register successively with the central ducts, and means for admitting steam to the hollow journal.

4. The combination with a steam-generator having an inlet-opening in its top, and a cylindrical casing over the same provided with an inlet-opening in its top of a rotary slag-carrier mounted in said casing and provided with a series of radial slag-receptacles, said carrier provided with a tubular hub having ports communicating with the slag-receptacles, and a stationary steam-pipe in said tubular hub and having a port in its bottom to register successively with the ports which communicate with the slag-receptacles.

5. The combination with a steam-generator having an inlet-opening in its top, and a casing over said opening, of a hollow rotary carrier mounted in said casing and provided with a series of radial slag-receptacles, said hollow carrier having peripheral grooves communicating with the interior of the carrier, packing-rings in said grooves, a tubular hub for said carrier, a stationary steam-pipe disposed within said tubular hub, said hub having a series of ports communicating with the interior of the carrier, and said tubular hub also having ports communicating with the bottoms of the radial slag-receptacles, said steam-pipe having an outlet-port in its bottom to communicate successively with the ducts in the tubular hub.

809,124. TRUNK. MARY E. HUMAN, Fort Smith, Ark. Filed Dec. 14, 1904. Serial No. 236,626.

Claim.—1. A circular trunk, comprising longitudinal sections hinged together, and unbroken circular boxes at the ends of said sections and forming the heads of the trunk, substantially as shown and described.

2. A circular trunk, comprising longitudinal sections hinged together, and unbroken circular boxes at the ends of said sections and forming the heads of the trunk, said unbroken circular boxes being greater in diameter than the intermediate portion of the trunk, substantially as shown and for the purpose set forth.

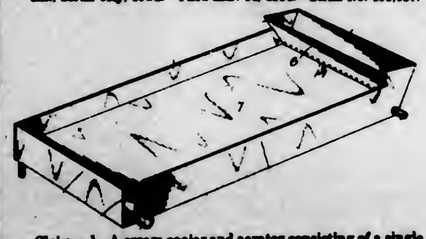
3. A circular trunk, comprising two longitudinal sections hinged together, one containing a series of boxes and the other having a hinged door, unbroken circular boxes forming the ends of the trunk when closed, and means for securing the parts in such closed position, substantially as shown and for the purposes set forth.

4. A circular trunk, comprising the semicircular longitudinal section 1 with a circular box forming the lower end thereof and a removable circular box at the upper end thereof, and a semicircular longitudinal section 1° hinged to the section 1 and having a door forming the inner side thereof, substantially as shown and described.

5. A circular trunk, comprising a semicircular longitudinal section 1 with a circular box forming the lower end thereof and a removable circular box at the upper end thereof, a mirror at the bottom of the removable circular box, and straps connecting said box to the section; together with a semicircular longitudinal section 1° hinged to the section 1 and having a door hinged at the inner side thereof, and a mirror in said door, substantially as shown and for the purpose set forth.

6. A circular trunk, comprising a semicircular longitudinal section 1 having a circular box forming the lower end or base thereof when the trunk is placed in a vertical position, a circular box removably mounted in the upper end of the section 1 and provided with a mirror, and semicircular boxes in said section between the aforesaid circular boxes; together with the section 1° hinged to the section 1 and provided with a door-frame and bottom, transverse rods at the upper portion of the section 1°, a door hinged in said frame, and means for securing the parts of the trunk together when the trunk is closed.

809,125. CREAM COOLER AND AERATOR. MARTIN MORTENSEN, Sioux City, Iowa. Filed Mar. 14, 1904. Serial No. 196,187.



Claim.—1. A cream cooler and aerator consisting of a single receptacle having one of its end walls extending upwardly and outwardly at an inclination and one end of each of its side walls arranged adjacent to said inclined end wall enlarged and having the upper portion projecting rearwardly, a partition in said receptacle for dividing it into an upper and a lower compartment, said partition having one end formed in a semicylindrical manner to constitute a collecting-trough at the lower end of said receptacle, a filtering-plate having the lower portion thereof perforated, said plate arranged above said partition, secured to the inner face of the enlarged ends of said side walls, bearing against the inclined end wall and in connection with said inclined end wall and the enlarged ends of said side walls forming a filtering-trough, a spout communicating with said collecting-trough, a cooling-medium-supply pipe communicating with said lower compartment, and a cooling-medium-exhaust pipe communicating with said lower compartment.

2. A cream cooler and aerator comprising a single receptacle having one of its end walls extending upwardly and outwardly at an inclination and one end of each of its side walls arranged adjacent to said inclined end wall enlarged and projecting rearwardly, one of said side walls at its other end suitably cut away, a partition arranged in said receptacle and adapted to divide it into an upper and a lower compartment, said partition having one end thereof formed in a semicylindrical manner to constitute a filtering-trough registering with the cut-away portion of said side walls, deflecting-plates arranged in staggered relation with respect to each other and secured in the lower of said compartments, a filtering-plate having the lower portion thereof perforated, said plate arranged above said partition, secured to the inner face of the enlarged ends of said side walls, bearing against the inclined end wall and in connection with the inclined end wall and the enlarged end of said side walls forms a V-shaped filtering-trough, a spout communicating with said collecting-trough, a cooling-medium-supply pipe communicating with said lower compartment, and a cooling-medium-discharge pipe communicating with said lower compartment.

3. A cream cooler and aerator consisting of a single receptacle having one of its end walls extending upwardly and outwardly at an inclination, and one end of each of its side walls arranged adjacent to said inclined end wall enlarged, said enlarged portion of each of the end walls projecting rearwardly and having an inclined edge, the forward edge of each of said enlarged portions extending at an inclination, said inclined end wall secured to the forward inclined edge of said enlarged portions, a partition in said receptacle for dividing it into an upper and a lower compartment, said partition bent at its lower end to constitute a collecting-trough at the lower end of said receptacle, an inclined filtering-plate having the lower portion thereof perforated, said plate secured to the enlarged portions of the side walls, arranged above said partition, and in connection with said inclined end wall and said enlarged portions of the side walls forming a filtering-trough, a spout communicating with said collecting-trough, and means for supplying and exhausting a cooling medium to and from the lower of said compartments.

809,126. ELECTRIC-LIGHT-FIXTURE INSULATOR. LOUIS MCCARTHY, Boston, Mass. Filed Feb. 2, 1905. Serial No. 243,236.

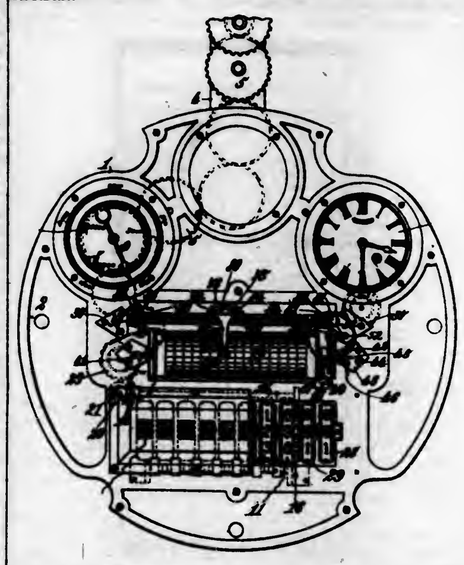
Claim.—1. The improved insulator for electric-light-fixture canopies comprising two ribs separated by an intervening depression, the outer edge of one rib being adapted to engage the inside edge of a canopy of one size, and the inner edge of the other rib being adapted to engage the outside edge of a canopy of another size, whereby the insulator may be used with more than one size of canopy.

2. The improved insulator for electric-light-fixture canopies comprising two ribs of which the inner is the higher separated by an intervening depression, the outer edge of one rib being adapted to engage the inside edge of a canopy of one size and the inner edge of the other rib being adapted to engage the outside edge of a canopy of another size, whereby the insulator may be used with more than one size of canopy.

809,127. STATION-METER INDEX. DONALD MCDONALD and LYNN M. SCOFIELD, Albany, N. Y., assignors to American Meter Company, New York, N. Y., a Corporation of New York. Filed Apr. 20, 1904. Renewed Dec. 8, 1905. Serial No. 290,961.

Claim.—1. In a station-meter index, in combination with a revolving cylinder adapted to carry a chart, a threaded shaft, a recording instrument operated by said shaft, a gear loosely mounted on said shaft, a jam-nut having screw-threaded engagement therewith and cooperating with said gear for the purpose described, and means for operating said gear.

2. In a station-meter index, a recorder comprising a shaft and means for rotating the same, a cylinder loosely mounted on said shaft and adapted to carry a chart, a binding-screw carried by said cylinder and projecting radially outward beyond the same and adapted to engage said shaft, a recording instrument cooperating with said recorder-cylinder, and means for operating said recording instrument.



3. In a station-meter index a recorder comprising a cylinder having a swinging segment for clamping a chart to the cylinder, and means carried by said segment and adapted to yieldingly engage the ends of the cylinder for holding said segment in its clamping position.

4. In a station-meter index, a recorder comprising a cylinder having a swinging segment for clamping a chart to the cylinder and provided in its ends with recesses, and spring-pressed pins carried by said segment and adapted to engage in said recesses for holding said segment in its clamping position.

5. In a station-meter index, a recorder comprising a cylinder having a portion thereof cut away, a segment pivotally mounted in the ends of the cylinder and adapted to close against one edge of the cut-away portion of the cylinder, and a bar extending parallel with such edge but at a distance therefrom, substantially as described.

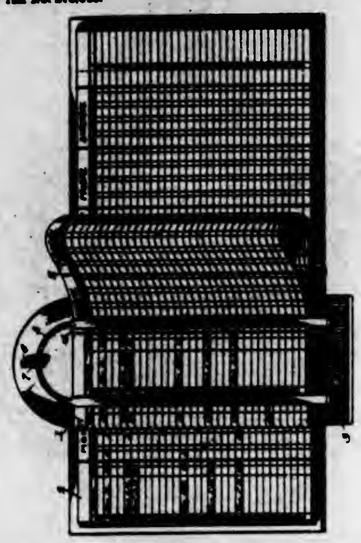
6. In a station-meter index, a recorder comprising a cylinder having a portion thereof cut away, a segment pivotally mounted in the ends of the cylinder and adapted to close against one edge of the cut-away portion of the cylinder, and a bar extending parallel with such edge but at a distance therefrom and projecting beyond the same, substantially as described.

7. In a station-meter index, a recorder comprising a cylinder having a segment thereof removed and pivotally mounted in the ends of the cylinder, radial plates projecting inward from said segment near the ends thereof, means carried by said plates and engaging the ends of the cylinder for holding the segment in a closed position, and a lifting device projecting through a curved slot in one end of said cylinder and secured to one of said plates for lifting said segment.

8. In a station-meter index, in combination with a recorder-drum, and means for rotating the same, a threaded shaft and means for rotating the same, a slidably-mounted carriage in mesh with said shaft, a recording instrument pivotally mounted on the outer end of said carriage and adapted to cooperate with said recorder-drum, and a spring-catch on said carriage adapted to engage the rear end of said instrument for holding it out of contact with said recorder-drum.

9. In a station-meter index, in combination with a recorder-drum and means for rotating the same, a threaded shaft and means for rotating the same, a slidably-mounted carriage in mesh with said shaft, a recording instrument pivotally mounted intermediate its ends on said carriage and adapted to cooperate with said recorder-drum, and a spring on said carriage adapted to engage the outer end of said instrument for holding it out of contact with said recorder-drum and to bear against the rear side of said instrument to hold it in yielding contact with said recorder-drum.

809,128. LEAF-HOLDER FOR USE IN TRANSFERRING ENTRIES. JOHN M. D. MCCORMICK, Alley, Ala. Filed Sept. 15, 1903. Serial No. 173,003.



Claim.—1. The combination with a book, of means for holding leaves in transferring entries from one leaf to another, consisting of a base lying between folds in adjacent leaves, one leaf lying under the base and having a reverse fold from one side of the base so as to lie on top thereof, and the end portion of another leaf laid upon the base from the other side thereof, and a clamp for holding the leaves in such position upon the base, substantially as described.

2. The means for holding leaves in transferring entries from one leaf to another of a book, consisting of a base, a clamp hinged to the base and comprising two parallel members spaced apart and connected together at one end by a nosk opposite the hinged end, and means for holding the clamp in its position on the base, said means being, located at the opposite end of the base from where the clamp is hinged so as to engage the connecting-nosk of the clamp, substantially as described.

3. The means for holding leaves in transferring entries from one leaf to another of a book, consisting of a base formed of adjustable members to vary its length, a clamp hinged to the base and formed of adjustable members to vary its length, and means for holding the clamp in its position on the base, substantially as described.

809,129. COOKING UTENSIL. JOHN R. NYE, Waterville, Me. Filed Mar. 23, 1905. Serial No. 251,481.

Claim.—1. In a cooking utensil, the combination with a receptacle having a projecting skirt at the bottom thereof and a lid at the top, of a cover or dome adapted to fit over said receptacle and have its lower edge engage the skirt to provide a dead-air space thereabove and around the receptacle.

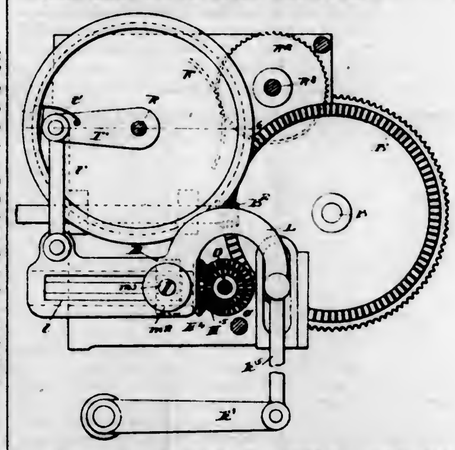
2. In a cooking utensil, the combination with a receptacle to receive the article to be cooked having a skirt projecting outwardly from the bottom thereof, a plurality of handles connected to the skirt and extending outwardly and upwardly, and a lid for the receptacle, of a dome or cover having its lower edge engaging the skirt and adapted to incase the entire receptacle and form a dead-air space thereabout.

3. In a cooking utensil, the combination with a receptacle to receive the article to be cooked having a skirt projecting outwardly from the bottom thereof, a plurality of handles connected to the skirt and extending outwardly and upwardly, and a lid for the receptacle, of a dome or cover having its lower edge engaging the skirt to surround the receptacle and form a dead-air space thereabout.

4. In a cooking utensil, the combination with a receptacle to receive the articles to be cooked, consisting of a body portion, a peripheral skirt or rim secured to the exterior of the bottom thereof and projecting outwardly, a plurality of handles having their short terminals connected to the skirt so that their handles project upward substantially parallel with the body of the receptacle, and a removable lid for the receptacle of a dome or cover adapted to have its lower edge engage the skirt and fit over the receptacle to form a dead-air space thereabout, consisting of a top having downwardly-projecting walls, and a handle carried by the top.

5. In a cooking utensil, the combination with a receptacle to receive the articles to be cooked, consisting of a body portion, a peripheral skirt or rim secured to the exterior of the bottom thereof and projecting upwardly, a plurality of handles having their short terminals connected to the skirt so that their handles project upward substantially parallel with the body of the receptacle and a removable lid or cover for the receptacle, of a dome adapted to have its lower edge engage the skirt and surround the receptacle to form a dead-air space therearound.

809,130. EQUALIZING WINDER FOR SPRING-MOTORS. CHRISTIAN PFEIFFER, New Britain, Conn., assignor to The New Britain Hardware Manufacturing Company, New Britain, Conn., a Corporation of Connecticut. Filed Nov. 18, 1903. Serial No. 181,701.



Claim.—1. The combination with a motor, of a winding mechanism, including a lever mechanism having an adjustable fulcrum, and means for shifting the fulcrum from the motor as it is being wound and unwound; substantially as described.

2. The combination with a motor having a transmitting-gear and a winding-gear, of a winding mechanism comprising a shaft geared to the winding-gear, a lever mechanism for rotating said shaft, a shifting fulcrum for the lever mechanism to vary the lever throw and extent of the winding, and operating connections between the said fulcrum and the transmitting and winding gears of the motor; substantially as described.

3. The combination with a motor having a transmitting-gear, and a winding-gear, of a lever mechanism operatively connected with the said winding-gear to wind the motor, a shifting fulcrum to vary the throw of the lever mechanism, gearing connecting the shifting fulcrum with the winding-gear of the motor and gearing connecting said shifting fulcrum with the transmitting-gear of the motor; substantially as described.

4. The combination with a motor having a transmitting-gear and a winding-gear, of a lever mechanism geared to the said winding-gear and including a shifting fulcrum-block, a tubular slotted shaft on which said shifting fulcrum reciprocates, a screw-shaft within the tubular shaft, a nut connecting the shifting fulcrum through said slot with the screw, gears on the ends of said tubular and screw shafts, and a second tubular and inner shaft geared respectively at one end with the first-named tubular and screw shafts, and at their other ends geared respectively to the said winding and transmitting gears of the motor; substantially as described.

5. The combination with a motor having a transmitting-gear and a winding-gear, of a shaft geared to the said winding-gear, for winding the motor, a lever mechanism for rotating said shaft, means for operating the lever mechanism, a shifting fulcrum for the lever mechanism to vary the throw thereof, and gearing connecting the said shifting fulcrum with the transmitting-gear and winding-gear of the motor, to shift the fulcrum back and forth as the motor is wound and unwound; substantially as described.

6. The combination with a motor having a transmitting-gear and a winding-gear, a shaft geared to the winding-gear and provided with a pulley or wheel, clutch-arms for rotating the wheel or pulley, slotted levers for rocking the clutch-arms, a fulcrum-saddle having an internal annular groove and provided with fulcrum trunnions or studs entering the lever-slots, mechanism for operating the levers, a longitudinally-slotted tubular shaft on which the said saddle slides, an inner screw-shaft, a nut extending through the shaft-slot into engagement with the screw-shaft, and having a lug projecting into the annular groove in the saddle and gearing connecting said tubular and screw shafts with the winding and transmitting gears of the motor; substantially as described.

7. The combination with a motor having a transmitting-gear, and a winding-gear, of a shaft geared to the said winding-gear and provided with a pulley or wheel, rocker-arms loose on the shaft, clutch devices at the rear ends of the arms to intermittently grip and release the wheel, longitudinally-slotted levers linked at their rear ends to the rear ends of said rocker-arms, a traveling fulcrum-forming saddle having trunnions entering the lever-slots, gearing for reciprocating the said saddle from the winding-gear and transmitting-gear of the motor, and rock-shafts connected to the slotted levers; substantially as described.

8. The combination with a motor having a winding-gear and a transmitting-gear, a transmitting-shaft meshing with the latter gear and provided with a loose transmitting-wheel and a clutch, a second oppositely-rotating transmitting-shaft loosely geared to the said transmitting-shaft and provided with a clutch and a transmitting-wheel, of a shaft geared to said winding-gear, an intermittent grip mechanism for rotating said shaft to wind the motor, and mechanism for controlling the throw of the intermittent grip mechanism from both the winding-gear and the transmitting-gear of the motor; substantially as described.

9. The combination with a motor having a transmitting-gear and a winding-gear, said winding-gear having an annular rim, a friction-clutch engaging the said rim, to prevent reverse rotation of the winding-gear, of a winding mechanism geared to said winding-gear, and a controlling mechanism for the extent of movement of the winding mechanism, and operatively connected to the said transmitting and winding gears of the motor; substantially as described.

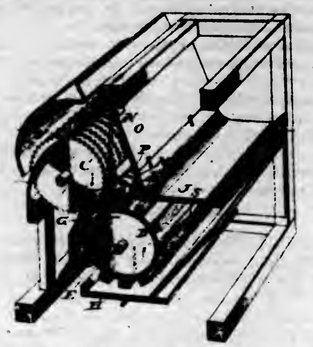
10. The combination with a motor having a transmitting and a winding gear, the latter having an annular rim, a bracket mounted alongside said winding-gear and a wedge-like friction-block loose on the bracket and adapted to wedge against said rim and prevent reverse rotation of the winding-gear, of a winding mechanism geared to the said winding-gear, and a controller for controlling the extent of movement of the winding mechanism, and operative connections between the controller and the said transmitting and winding gears; substantially as described.

809,131. COTTON-GIN. FRANK PHELPS, Wellston, Okla. Filed Feb. 23, 1905. Serial No. 246,574.

Claim.—1. In a gin, the combination of the ginning member, brush, and brush-chamber, the ginning member and brush being so relatively disposed that matter centrifugally discharged from the ginning member will fall upon the top of the brush-chamber, and an upright divider-board upon the top of the brush-chamber, closely adjacent to the ginning member.

2. In a gin, the combination of the saws, means for removing the lint from the lower sides thereof, and a settling-chamber for motes, dirt and waste open to the exposed rear portions of the saws, and a divider-board in the bottom of said chamber having a concave front face immediately adjacent to the rear of the saws and an inclined back face slanting rearwardly downward from the peripheries of the saws toward the bottom of said settling-chamber.

3. In a gin, the combination of the saws, means for removing the lint from the lower side thereof, a receptacle for centrifugally-ejected motes, dust and waste particles located back of the saws below the axis of rotation thereof, and a divider-board between said receptacle and the saws closely adjacent to the latter.



4. In a gin, the combination of the saws, means for removing the lint from the lower side thereof, a receptacle for centrifugally-ejected motes, dust and waste particles located back of the saws below the axis of rotation thereof, a divider-board between said receptacle and the saws adjacent to the latter, and a swinging gate having its lower end adapted to reach either the top of said divider-board or the opposite side of said receptacle to permit the discharge of such particles into said receptacle or not, as preferred.

5. In a gin, the combination of the saws, the lint-removing brush below the saws, a divider-board between the approaching peripheries of the saws and brush curved to the shape of the saws, and a deflector-board between the opposite or receding peripheries of the saws and brush.

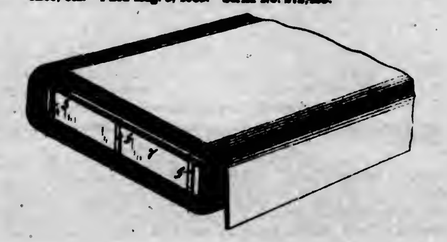
6. In a gin, the combination of the breast-plate, saws, and lint-removing brush below the saws, the brush-chamber whose ceiling is back of the lower part of the saws, a dust or waste chamber above said ceiling, said chamber having a longitudinal recess or trough in its bottom, and a divider-board between said recess and the saws having a concave front face adjacent to the saws and a rearwardly downwardly slanting rear face.

7. In a gin, the combination of a ginning member or saws, the brush, and brush-chamber, the ginning member and brush being so relatively disposed that matter centrifugally discharged from the ginning member will fall upon the top of the brush-chamber, and an upper divider-board upon the top of the brush-chamber adjacent to the rear portion of the saws and curved in conformity therewith.

8. In a gin, the combination of the saws, means for removing the lint from the lower sides thereof, and a settling-chamber for waste, &c., opening to the exposed rear portions of the saws, a divider-board at the bottom of said chamber having a concave front face adjacent to the rear of the saws, a longitudinal trough or pocket back of said divider-board, and a conveyer therein.

9. In a gin, the combination of the saws, a brush-chamber lower than the saws having a removable ceiling supported upon the inside of the gin-frame, an inner discharge-chute having a hinged ceiling, a mote-receptacle above the brush-chamber, a swinging gate behind the saws adapted to permit or cut off the discharge of motes therewinto, the sides of the brush-chamber having circular openings axially alined with the brush, and removable coverings for the same, whereby access can be had to the ends of the brush and the rear of the saws and brush.

809,132. TICKET-HOLDER. NICHOLAS A. PLANCICH, San Francisco, Cal. Filed Aug. 3, 1905. Serial No. 272,463.



Claim.—1. An article of the class described, comprising a pin and a laterally-expanded head comprising a bottom cross-bar, side uprights, and top cross-bar, the cross-bars and uprights forming a slot extending transversely through the head parallel with the bottom cross-bar, substantially as described.

2. An article of the class described comprising a pin, and a laterally-expanded head comprising a bottom cross-bar, a top cross-bar over the bottom bar, the said bars being so secured so as to form a slot between, said top bar being depressed so as to act as a spring.

3. An article of the class described comprising a pin, provided with a flat surface to prevent the same from turning when inserted in place, and a laterally-expanded head comprising bottom and top cross-bars, side uprights, the cross-bar and uprights forming a slot extending parallel with the bottom cross-bar.

809,133. REPEATING-ALARM CLOCK. WILSON H. PORTER, New Haven, Conn., assignor to The New Haven Clock Company, New Haven, Conn., a Corporation of Connecticut. Filed Apr. 17, 1903. Serial No. 153,361.

Claim.—1. In a repeating-alarm clock, the combination with the time-train; of an alarm-train; an alarm-checking lever; a repeating-alarm lever normally yieldingly engaging said alarm-checking lever; a device operated by the time-train to intermittently release said repeating-alarm lever from engagement with said alarm-checking lever; and mechanism operated by the time-train to disengage said repeating-alarm lever from said releasing device, substantially as described.

2. In a repeating-alarm clock, the combination with the time-train; of an alarm-train; an alarm-checking lever; a repeating-alarm lever normally yieldingly engaging said alarm-checking lever; a device operated by the time-train to intermittently release said repeating-alarm lever from engagement with said alarm-checking lever; and mechanism for simultaneously disengaging the repeating-alarm lever from said releasing device, and engaging said alarm-checking lever to check the alarm-train, substantially as described.

3. In a repeating-alarm clock, the combination with the time-train; of an alarm-train; an alarm-checking lever; a repeating-alarm lever normally yieldingly engaging said alarm-checking lever; a device operated by the time-train to intermittently release said repeating-alarm lever from engagement with said alarm-checking lever; and mechanism operated by the time-train for disengaging the repeating-alarm lever from said releasing device except when the alarm-train is released, substantially as described.

4. In a repeating-alarm clock, the combination with the time-train; of an alarm-train; an alarm-checking lever; an alarm-lever adapted to engage said alarm-checking lever and operated by the time-train to periodically release the alarm-checking lever; a repeating-alarm lever normally yieldingly engaging said alarm-checking lever; a device operated by the time-train to intermittently release said repeating-alarm lever from engagement with said alarm-checking lever, said repeating-alarm lever being disengaged from said releasing device by said alarm-lever when the latter is in engagement with said alarm-checking lever, substantially as described.

5. In a repeating-alarm clock, the combination with the time-train; of an alarm-train; an alarm-checking lever; a repeating-alarm lever normally yieldingly engaging said alarm-checking lever; a device operated by the time-train to intermittently release said repeating-alarm lever from engagement with said checking-lever; and an alarm-lever adapted to simultaneously engage said alarm-checking lever to check the same and said repeating-alarm lever to disengage the latter from said releasing device, said alarm-lever being operated by the time-train periodically to simultaneously release said alarm-checking lever and said repeating-alarm lever, substantially as described.

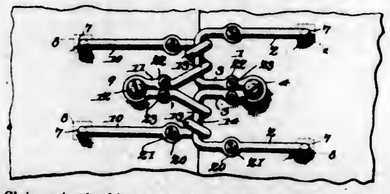
6. In a repeating-alarm clock, the combination with the time-train; of an alarm-train; an alarm-checking lever; a repeating-alarm lever normally yieldingly engaging said alarm-checking lever; a device operated by the time-train to intermittently release said repeating-alarm lever from engagement with said alarm-checking lever; and mechanism operated by the time-train for simultaneously disengaging said repeating-alarm lever from said releasing device and engaging said alarm-lever, substantially as described.

7. In a repeating-alarm clock, the combination with the time-train; of an alarm-train; an alarm-checking lever; a repeating-alarm lever normally yieldingly engaging said alarm-checking lever; a device operated by the time-train to intermittently release said repeating-alarm lever from engagement with said alarm-checking lever; a lever operated by the time-train adapted to disengage said repeating-alarm lever from said releasing device, and to periodically release said repeating-alarm lever, substantially as described.

8. In a clock-movement, the combination with a time-train; of a lever rocked by said time-train; mechanism adapted to disengage said lever from said time-train and operated by said train to periodically release said lever, substantially as described.

9. In a repeating-alarm clock, the combination with a time-train; of an alarm-train; an alarm-checking lever; a repeating-alarm lever normally yieldingly engaging said alarm-checking lever; a ratchet-wheel operated by the time-train to intermittently release said repeating-alarm lever from engagement with said alarm-checking lever; and a lever operated by the time-train to disengage said repeating-alarm lever from said ratchet, substantially as described.

809,134. WIRE HINGE. CURTIS D. REECE and FREDERICK T. AUSTIN, Corydon, Iowa. Filed Apr. 1, 1905. Serial No. 253,280.



Claim.—A wire hinge comprising a pair of yoke-shaped members, the bow of each member being provided with an eye for the reception of a fastening, the ends of one of the yokes being bent laterally outward to form pintle elements lying in the plane of the member and the extremities of the pintle elements being bent at substantially right angles thereto and formed into attaching elements, the side of the other hinge member being loosely coiled around the pintle elements with their extremities formed into attaching elements disposed in substantial parallelism with the attaching elements of the first-mentioned hinge member.

809,135. PENCIL-HOLDER. ISAAC C. REESOR, El Paso, Tex. Filed July 6, 1905. Serial No. 268,267.

Claim.—1. A device of the class described, comprising pencil-clamping means provided with opposite clamping-jaws and having a resilient projecting portion, and a clamping jaw or lever supported by the said resilient projecting portion, said resilient projecting portion serving to hold the lever in engagement with a pocket or other portion of a garment.

2. A device of the class described, comprising pencil-engaging means provided with a loose coil having a projecting resilient portion, said pencil-engaging means being also provided with a pair of oppositely-disposed substantially U-shaped jaws curved to conform to the configuration of a pencil and arranged to embrace the same, the terminals of the jaws being separated, and a clamping-lever connected at an intermediate point with and supported by the projecting resilient portion, which forms a spring for holding the lever in engagement with the garment.

3. A device of the class described, comprising a pencil-receiving coil having means for positively engaging a pencil or the like and provided with a projecting resilient portion, and a lever formed integral with the pencil-receiving coil and connected with and supported by the resilient projecting portion, said lever consisting of opposite loops or arms, the outer end of one of the loops being bent at an angle and extended laterally, and the terminal of the material being coiled around the lever at its point of connection with the resilient projecting portion, which forms a spring for holding the lever in engagement with the garment.

4. A device of the class described, comprising clamping means for engaging a garment, a pencil-receiving coil forming a spring for the clamping means, and means independent of the coil and the said clamping means for engaging the opposite sides of a pencil.

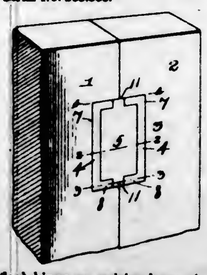
5. A device of the class described, comprising clamping means for engaging a garment, a pencil-receiving coil forming a spring for the clamping means, and a pair of clamping-jaws connected with the coil and arranged to engage a pencil at opposite sides thereof.

809,136. VENEER-CUTTING MACHINE. JAMES J. RUSSELL, Milwaukee, Wis. Filed Mar. 26, 1904. Serial No. 200,695.

Claim.—1. In combination with the knife and presser-bar of a veneer-cutting machine, said presser-bar having a series of transversely-arranged slots in its under side, of a set of roughing-tools in said slots, each tool having longitudinal grooves on its under side and beveled at right angles to said grooves on its inner end, whereby a series of roughing or scoring points are formed on the inner end of said tool, said tools being arranged to score or roughen the veneer sheet as it is cut from the log, substantially as described.

2. In a stave-veneer-cutting machine the combination of the presser-bar having a series of transverse slots in its under side, a set of adjustable roughing-tools slidably fitted in said slots, and bolts tapped through the outer edge of the presser-bar for adjusting said roughing-tools toward the inner edge of the bar; with a cutting-knife arranged below the cutter-bar, with its cutting edge approximately opposite the working edges of the cutting-tools, substantially as described.

809,137. FLUSH HINGE. THOMAS F. SALING, Cora, Idaho. Filed June 15, 1905. Serial No. 265,360.



Claim.—1. A flush hinge comprising leaves 4, 4 formed with inturned flanges 8 having cut-away corners 9, a link 5 adapted to fit between said leaves and having stops 11 at its ends, to engage the cut-away corners of said flanges, and pivots connecting said link to the flanges of said leaves, substantially as described.

2. A flush hinge comprising leaves 4, 4 formed at their ends with inwardly-projecting flanges having beveled corners, and upon their inner sides with longitudinally-extending recesses, a link 5 disposed between the flanges of said leaves and having beveled edges to coact with the recesses in said leaves, and wedge-shaped stops at its ends to coact with the beveled corners of said flanges, and pivot-pins passed through said flanges and into said link, substantially as described.

809,138. MILK-PRESERVE AND PROCESS OF MAKING SAME. LEOPOLD LARASSE, Berlin, Germany, assignor to C. F. Boehringer & Soehne, Maschinen-Waldhof, Baden, Germany, a Firm. Filed Mar. 13, 1905. Serial No. 249,816.

Claim.—1. The process of preparing a milk-preserve, which consists in evaporating, at a temperature not exceeding 60° centigrade, a milk containing a substantial amount of living lactic-acid germs.

2. The process of preparing a milk-preserve, which consists in preparing a milk containing a substantial amount of living lactic-acid germs, and then evaporating said milk at a temperature not exceeding 60° centigrade.

3. The process of preparing a milk-preserve, which consists in evaporating, in a vacuum, at a temperature not exceeding 60° centigrade, a milk containing a substantial amount of living lactic-acid germs.

4. The process of preparing a milk-preserve, which consists in evaporating a milk containing a substantial amount of living lactic-acid germs, in a vacuum, at a temperature not exceeding 60° centigrade, while keeping the mass in motion.

5. The process of preparing a milk-preserve, which consists in evaporating to dryness, at a temperature not exceeding 60° centigrade, a milk containing a substantial amount of living lactic-acid germs.

6. The process of preparing a milk-preserve, which consists in evaporating to dryness, at a temperature not exceeding 60° centigrade, a milk containing a substantial amount of living lactic acid germs, and then grinding the resultant product.

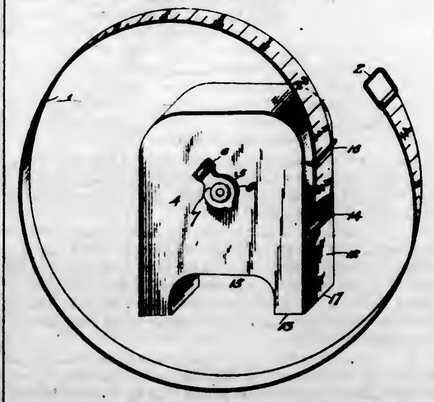
7. The process of preparing a milk-preserve, which consists in preparing a milk containing a substantial amount of living lactic-acid germs, and then evaporating said milk to dryness at a temperature of about 53° centigrade.

8. The process of preparing a milk-preserve, which consists in preparing a milk containing a substantial amount of living lactic-acid germs, then evaporating said milk to dryness at about 53° centigrade, and grinding the resultant product to a fine powder.

9. As a new article of manufacture, a milk-preserve in the form of a powder, containing living lactic-acid germs and the non-aqueous constituents of the milk from which it is obtained and having an agreeable and slightly-acid flavor.

10. As a new article of manufacture, a milk-preserve, in the form of a powder containing living lactic-acid germs and the non-aqueous constituents of buttermilk and having an agreeable and slightly-acid flavor.

809,139. MEASURING-TAPE. EDMUND L. SAXTON, Lansing, Mich. Filed June 20, 1905. Serial No. 267,675.

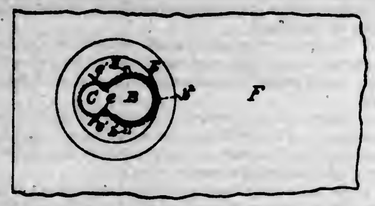


Claim.—A device of the character described, comprising a casing having two of its sides disposed in planes at right angles to each other, one of said sides being formed with an opening and the other with a finger-recess, a winding-drum in said casing, a measuring-tape wound upon said drum and passing through said opening, a combined tape-guide and indicator upon said casing, and graduations upon said tape so disposed that the measurement read at said indicator will include the distance from the outer end of said tape to the square end of said casing, substantially as described.

809,140. CURTAIN-FASTENER. JAMES SOMMERS, Newport, Ky. Filed Jan. 23, 1905. Serial No. 242,265.

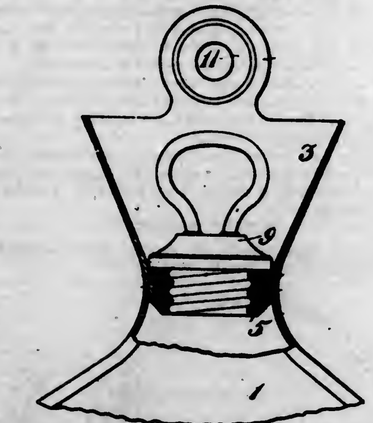
Claim.—1. In a curtain-fastening, the combination of cap A having larger and smaller connecting-openings B and C; wall b at the edge of opening B; spring E lying around wall b and having depressible points projecting into opening C; tang b^5 on wall b for re-

curing spring E in position, and lugs b' on wall b for guiding spring E, substantially as specified.



2. In a curtain-fastening, the combination of cap A having larger and smaller connecting-openings B and C; walls b and c on the edges of openings B and C; spring E lying around wall b and having depressible points projecting into opening C; tang b^3 on wall b for securing spring E in position, and lugs b' on wall b for guiding spring E, substantially as specified.

809,141. HOT-WATER BOTTLE. EDWARD J. SCHUTZ, Akron, Ohio. Filed Mar. 27, 1905. Serial No. 252,491.



Claim.—1. A water-bottle having its body portion extended to form a filling-funnel and further having its neck provided with an integral inwardly-extending annular rib, and a stopper-receiving means clamped to said rib.

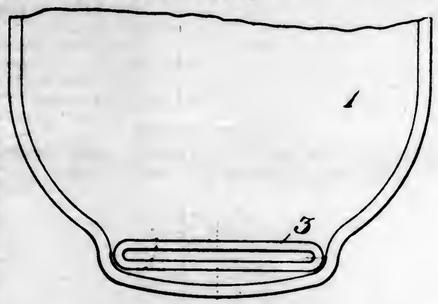
2. A water-bottle having its body portion extended to form a filling-funnel and further having its neck provided with an integral inwardly-extending annular rib, a socket-forming means arranged within said neck and having a portion thereof engaging one face of said rib, and means engaging said socket-forming means for clamping the socket to the rib, said socket-forming means adapted to receive the bottle-stopper.

3. A water-bottle having its body portion extended to form a filling-funnel and further provided with an integral inwardly-extending annular rib in the neck portion thereof, a socket-forming means arranged within said neck and having a portion thereof engaging one face of said rib, and means engaging said socket-forming means for clamping the socket-forming means to the rib, said socket-forming means adapted to receive the bottle-stopper.

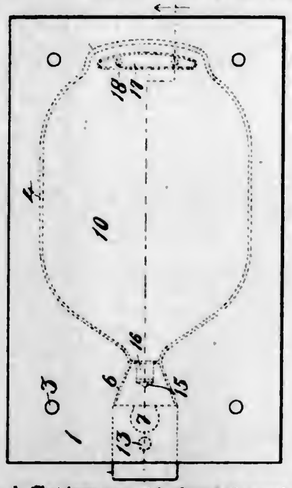
4. A water-bottle having its body portion extended to form a filling-funnel and further provided with an integral inwardly-extending annular rib in the neck portion thereof, a socket-forming means having a post thereof engaging one face of said rib, a ring mounted upon the opposite face of said rib, and means engaging the socket-forming means for clamping the same to the rib, said socket-forming means adapted to receive the bottle-stopper.

809,142. HOT-WATER BOTTLE. EDWARD J. SCHUTZ, Akron, Ohio. Filed Mar. 27, 1905. Serial No. 252,492.

Claim.—A hot-water bottle having the walls thereof provided with a transversely-extending opening of sufficient size to permit the withdrawal therethrough of a core or mandrel on which the bottle is formed without injury to the bottle and further having that portion of the walls around the opening secured together, and a gromet extending through the opening, secured to the walls and constituting a lining for said opening.



809,143. METHOD FOR MAKING HOT-WATER BOTTLES. EDWARD J. SCHUTZ, Akron, Ohio. Filed Sept. 18, 1905. Serial No. 278,958.



Claim.—1. That improvement in the art of manufacturing water-bottles and the like from rubber, which consists in vulcanizing the body and filling-funnel of a water-bottle as a unitary article around a suitable core or mandrel in a mold, and simultaneously forming in the body portion of said bottle an opening at a point distinct from the neck portion thereof, and then removing the core or mandrel through said opening.

2. That improvement in the art of manufacturing water-bottles and the like from rubber, which consists in vulcanizing the body and filling-funnel thereof as a unitary article around a suitable core or mandrel in a mold, and simultaneously forming in the body portion of said bottle an opening distinct from the neck portion thereof, then removing said core or mandrel through said opening and subsequently lining the opening through which said core or mandrel was withdrawn, whereby leakage from said bottle is prevented.

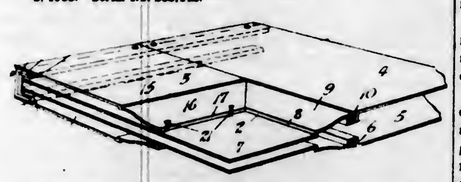
3. That improvement in the art of manufacturing water-bottles from rubber which consists in vulcanizing the body and filling-funnel of a water-bottle as a unitary article around a separable core or mandrel in a suitable mold, then withdrawing the core or mandrel by which the interior of the bottle is shaped through a suitable opening in the body of the bottle at a point distant from the neck portion thereof, and subsequently lining the opening through which the mandrel is removed by means of a gromet.

809,144. HORSESHOE. JOHN SMALLPEICE, Manchester, England. Filed Mar. 7, 1903. Serial No. 146,062.

Claim.—1. A detachable hoof-pad, comprising a metal frame, a bag secured thereto, an inflatable rubber pad within the bag, and means for detachably securing it to a permanent metal shoe.

2. In combination with a permanent metal horseshoe, having pins projecting from the rear ends and stud-holes in the shoe, a hoof-pad comprising a metal frame with turned-up ends, holes in said up-turned ends adapted to fit over the pins of the shoe, studs projecting through the hoof-pad frame and fitting the stud-holes in the shoe, and an inflatable bag stitched to said frame.

809,145. DOOR. NILS P. SJOGREN, Jamestown, N. Y. Filed June 2, 1905. Serial No. 263,443.



Claim.—1. A door comprising stile-sections, end sections interlocking with the stile-sections and extending transversely of the door, and panel-sections interlocking with the stile-sections between the end sections, said panel-sections being secured beyond said interlocking plane by the interlocking of the stile and end sections.

2. A door comprising stile-sections, end sections interlocking with the stile-sections and panel-sections interlocking with the stile-sections between the end sections, said panel-sections being secured to the stile-sections beyond their interlocking-plane.

3. A door comprising stile-sections, end sections interlocking with the stile-sections, and panel-sections interlocking with the stile-sections between the end sections, the side edges of the panel-sections being secured between the interlocking connections of the stile-sections and end sections.

4. A door comprising stile-sections provided with locking-flanges on their inner edges, end sections formed with locking-flanges to engage the locking-flanges of the stile-sections, and panel-sections formed on their side edges for a portion of their length with interlocking flanges to engage the interlocking flanges of the stile-sections between the end sections.

5. A door comprising stile-sections provided with locking-flanges on their inner edges, end sections formed with locking-flanges to engage the locking-flanges of the stile-sections, and panel-sections formed on their side edges for a portion of their length with interlocking flanges to engage the interlocking flanges of the stile-sections between the end sections, the remaining length of the side edges of the panel-sections being plain to engage between the interlocking flanges of the end sections and stile-sections.

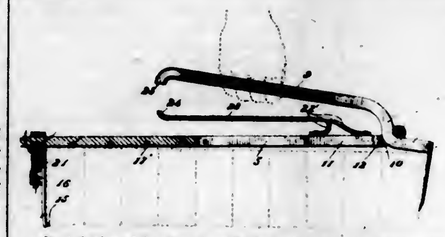
6. A door comprising stile-sections, panel-sections secured thereto and end sections secured to the stile-sections, a keeper to support the edges of the end sections between the stile-sections, and a binder within the keeper to receive the ends of the panel-sections.

7. A door comprising stile-sections, panel-sections secured thereto and end sections secured to the stile-sections, a keeper to support the edges of the end sections between the stile-sections, a binder within the keeper to receive the ends of the panel-sections, and means passed through the end sections and between the binder and keeper to secure said parts together.

8. A door comprising stile-sections, panel-sections secured thereto and end sections secured to the stile-sections, a keeper to support the edges of the end sections between the stile-sections, a binder within the keeper to receive the ends of the panel-sections, and rivets passed through the end sections and between the binder and keeper, the approximate wall of the former being channeled to receive said rivets.

809,146. BRICK-TONGS. RASMUS SKOV and JOHN PEDERSEN, Aneta, N. D. Filed May 27, 1905. Serial No. 262,061.

Claim.—1. A device of the class described comprising a stationary and a relatively movable clamping member, and a detachable gripping-jaw mounted for longitudinal adjustment on said stationary member.



2. A device of the class described comprising a stationary and a relatively movable clamping member, a detachable gripping-jaw mounted for longitudinal adjustment on said stationary member, and means for locking the gripping-jaw in adjusted position.

3. A device of the class described comprising a stationary and a relatively movable clamping member, and a handle carried by the stationary member for coöperation with the movable member in receiving and releasing the load.

4. A device of the class described comprising a stationary clamping member provided with a series of locking-recesses, a movable clamping member pivotally associated therewith, an adjustable gripping-jaw mounted for longitudinal movement in the stationary member, and a locking-bolt carried by the gripping-jaw for engagement with said recesses.

5. A device of the class described comprising a stationary clamping member provided with a plurality of locking-recesses, a relatively movable clamping member pivotally supported on said stationary member and provided with a fixed terminal gripping-jaw, an adjustable gripping-jaw mounted for longitudinal movement on the stationary member, a perforated lug secured to said adjustable gripping-jaw and having a cam-slot formed in the walls thereof, a spring-pressed bolt slidably mounted in the perforated lug and adapted to engage the locking-recesses in said stationary member, and means for operating said bolt.

6. A device of the class described comprising a stationary clamping member having one end thereof bent upwardly and provided with a terminal slot, a relatively movable clamping member pivotally supported in said slot, and an adjustable gripping-jaw mounted for longitudinal movement on the stationary member.

7. A device of the class described comprising a stationary clamping member provided with a terminal upwardly-bent head having a slot or recess formed therein, the walls of which are curved or rounded, and a relatively movable clamping member provided with an intermediate curved shoulder for engagement with the walls of said slot.

8. A device of the class described comprising a stationary clamping member, a relatively movable clamping member pivotally mounted thereon and having one end thereof extended to form a longitudinally-disposed operating-handle, and an auxiliary handle secured to and spaced from the stationary member and adapted to engage the main handle for limiting the downward movement of the latter.

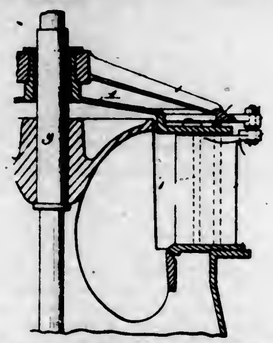
9. A device of the class described comprising a stationary clamping member, a relatively movable clamping member pivotally mounted thereon and provided with a longitudinally-disposed handle the end of which is bent downwardly, and an auxiliary handle secured to and spaced from the stationary member and provided with an upturned terminal for engagement with the free end of the main handle for limiting the downward movement of the latter.

809,147. TURBINE. CHARLES H. SMITH, York, Pa., assignor to S. Morgan Smith Company, York, Pa., a Corporation of Pennsylvania. Filed Sept. 27, 1904. Serial No. 226,176.

Claim.—1. In a turbine, the combination with the gate-operating mechanism and a set of gates, of an adjustable connecting member between each of the gates and said mechanism, said member provided with concentric and eccentric portions, said concentric portion attached to said mechanism and said eccentric portion connected with a gate.

2. In a turbine, the combination with the gate-operating mechanism and a set of gates, of removable shouldered adjustable con-

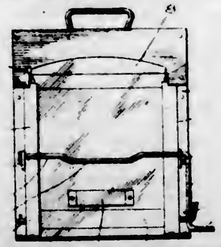
meeting members abutting against and attached to said mechanism and connected with the gates.



3. In a turbine, the combination with an apertured operating mechanism for the gates, and a set of gates each provided with a lug having an oval-shaped opening, of an adjustable connecting member between each of the gates and said mechanism, each of said members provided with a concentric and eccentric portion, said concentric portion adapted to extend in an aperture formed in said mechanism and said eccentric portion adapted to extend in the oval-shaped opening of the gate.

4. In a turbine, the combination with the gate-operating mechanism and a set of gates, of an adjustable connecting member between each of the gates and said mechanism, said member provided with a concentric and an eccentric portion, one of said portions attached to said mechanism and the other of said portions connected with the gate.

809,148. **TRAP.** CHARLES SPINLER, Blooming Prairie, Minn. Filed June 10, 1905. Serial No. 264,637.



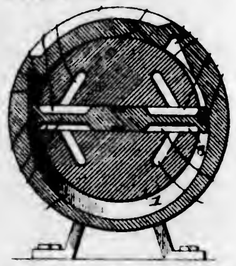
Claim.—1. In a trap the combination with a body portion having an opening therein, of a closure for the opening arranged for vertical movement into and out of operative position, a revoluble crank-shaft disposed across the opening for movement to bring its crank into and out of the path of movement of the door, said crank being adapted to receive the door thereupon to support the latter, means for holding the crank-shaft with its crank in position to support the door, and means operable by an animal within the body portion for moving the shaft-holding means out of operative position.

2. A trap comprising a body portion having an opening therein and having guides at the sides of the opening, a door slidably mounted in the guides for movement into and out of position to close the opening, a revoluble crank-shaft disposed for movement to bring its crank into and out of position to receive the door thereupon to hold the door in inoperative position, said door being arranged to move into operative position when the crank is moved out of position to support the door, means for holding the shaft with its crank in operative position, a trip-plate within the body portion, a trigger connected with the trip-plate and an arm carried by the crank-shaft, said trigger being adapted to receive the arm thereupon at times to hold the crank-shaft with its crank in operative position, said trip-plate being operable by an animal within the body portion to bring the trigger out of operative position.

3. A trap comprising a body portion having an opening therein, vertical guides located at the sides of the opening, a bottom for the body portion comprising a metallic plate having its forward edge portion bent inwardly upon itself and then upwardly, the upwardly-bent portion lying inwardly of the guides and a door slidably mounted in the guides, said door being arranged to lie with its lower edge forwardly of the upwardly-turned portion of the bottom and in close relation thereto when the door is in closed position.

4. In a trap the combination with a body portion having an opening therein, of a door movable into and out of position to close the opening, a crank-shaft arranged for movement into and out of the path of movement of the door said crank when in the path of movement of the door being arranged to hold the latter in inoperative position, an arm carried by the crank-shaft, a second shaft journaled in the body portion, a trigger carried by the second shaft and adapted to receive the arm of the crank-shaft thereupon to hold the crank-shaft with its crank in the path of movement of the door, a trip-plate mounted upon the second-named shaft within the body portion and lying with its forward edge portion depressed when the trigger is in position to receive the arm thereupon, said trip-plate being adapted to receive weight upon its rearward portion to remove the trigger out of operative position and a bait-holder within the body portion adjacent to the rearward portion of the trip-plate.

809,149. **ROTARY ENGINE.** DANIEL B. STALKER, Hot Springs, Ark., assignor of one-half to Arthur S. Koyer, Los Angeles, Cal. Filed Jan. 16, 1905. Serial No. 241,200.



Claim.—1. In a rotary engine, a fixed hub having live-steam and exhaust ports therein, said hub having a cross-slot, a slidable valve mounted in said slot, a revoluble cylinder having a passage extending part way around the hub within said cylinder, said passage ending in a shoulder means to reciprocate said slidable valve, and means to place said live-steam port in communication with said passage.

2. In a rotary engine, a fixed hub having live-steam and exhaust ports therein, said hub having a cross-slot, a slidable valve mounted in said slot, a revoluble cylinder, having an eccentric passage ending with a pocket, mounted around said hub, and means to place said live-steam ports alternately into communication with said eccentric passage.

3. In a rotary engine, a fixed hub having live-steam and exhaust ports therein, said hub having a cross-slot, a slidable valve mounted in said slot, a revoluble cylinder, having an eccentric passage ending in a pocket mounted around said hub, an exhaust-passage communicating with said exhaust-ports, means to place said live-steam ports alternately into communication with said means to place said exhaust-ports, alternately into communication with said passage.

4. In a rotary engine, a fixed hub having live-steam and exhaust ports therein, said hub having a cross-slot, a slidable valve mounted in said slot, a revoluble cylinder, having an eccentric passage ending in a pocket, mounted around said hub, an exhaust-passage communicating with said exhaust-ports, said valve having means to place said live-steam ports alternately into communication with said eccentric passage, and means to place said exhaust-ports alternately into communication with said passage.

5. In a rotary engine, a fixed hub having live-steam and exhaust ports therein, said hub having a cross-slot, a slidable valve mounted in said slot, a revoluble cylinder, having an eccentric passage ending in a pocket at each end, each pocket opening toward the passage, said valve having means to place said live-steam ports alternately into communication with said eccentric passage, and means to convert said live-steam ports into exhaust-ports and vice versa, whereby the engine may be reversed.

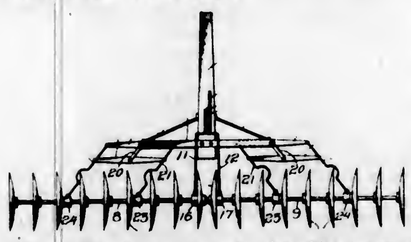
6. In a rotary engine, a fixed hub having live-steam and exhaust ports therein, said hub having a cross-slot and passages from said live-steam and exhaust ports to said slot, a slidable valve mounted in said slot, said valve having recesses or cavities on both faces opposite said passages, a cylinder having an interior cut-out portion forming a passage between said hub and cylinder, said cylinder having an interior shoulder, and means to reciprocate said valve whereby the live-steam ports are alternately placed into communication with the passage between said cylinder and hub.

7. In a rotary engine, a fixed hub having live-steam and exhaust ports therein, said hub having a cross-slot and passages from said live-steam and exhaust ports to said slot, a slidable valve mounted in said slot, said slot having recesses or cavities on both faces opposite said passages, a cylinder having an interior eccentric cut-out portion forming a passage between said hub and cylinder, said last-named passage ending in a pocket, said sliding valve adapted to be reciprocated by the eccentric form of said passage and said live-steam ports are alternately placed into communication with said eccentric passage.

8. In a rotary engine, a fixed hub having four ports, a cross-slot, passages connecting each of said ports with said slot and an exhaust-passage connecting with another central port, a steam-chest arranged at the opening of said ports, a reversing-valve having a passage therein adapted to cover either pair of diametrically opposite ports and place them in communication with the exhaust-passage, a slidable valve mounted in said cross-slot, a revoluble cylinder having an eccentric cut-out portion ending in a pocket between said hub and cylinder, and means to place said live-steam ports alternately into engagement with said last-mentioned passage.

9. In a rotary engine, a fixed hub having a cross-slot, a slidable valve mounted in said slot, said valve having recesses or cavities in each of its faces separated by packing-strips, a rotary cylinder mounted around said hub and having an eccentric inner surface adapted to reciprocate said valve, said hub having live-steam and exhaust ports adapted to be alternately placed into communication with the interior of the cylinder by way of the recess in said valve, and said cylinder having pockets for the steam whereby said cylinder is rotated.

809,150. **HARROW.** GUSTAVUS A. TRUCKENBROD, Lamoille, Ill. Filed Apr. 4, 1905. Serial No. 253,814.

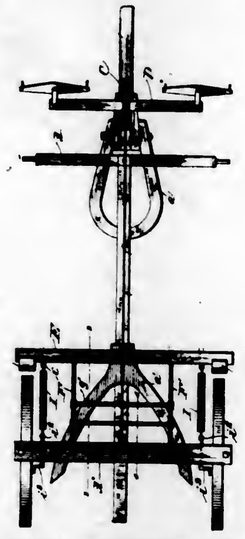


Claim.—1. In a harrow, the combination with a tongue, of cross-beams carried by said tongue, shafts, disks carried by the shafts, frames pivoted between the ends of said cross-beams and including each a pair of parallel members, a link connected with said members, draft-rods pivotally connected at the end of the said parallel members and to the said shaft, and means for adjusting the shafts to aline or lie at various angles, the draft-rods being in position to lie at right angles to their respective shafts when the latter are at a predetermined angle to each other.

2. A harrow comprising a tongue, shafts, cross-beams carried by said tongue, one of said beams being disposed above and the other of said beams being disposed below said tongue, draft-frames pivoted between the ends of said beams, said frames including spaced parallel members, a link pivotally connected at its ends to the said members at the point of pivotal connection of the said frame with the said beams, draft-rods having one of their ends pivotally connected to said parallel members and having their other ends pivotally connected to said shaft, and means for adjusting the said shafts to aline or lie at various angles, the draft-rods being so positioned as to lie parallel to each other at all times and at right angles to their respective shafts when the latter are at a predetermined angle to each other.

809,151. **AUTOMATIC WAGON-BRAKE.** EVERETT F. VEATCH, Pulse, Kans. Filed June 3, 1905. Serial No. 263,573.

Claim.—1. In a wagon-brake, the combination of the front and rear axles, a tongue connected with the front axle, a housing on the tongue provided with an opening through its upper face, a doubletree slidably mounted in the housing, a block pivoted in the opening in the housing for retaining the doubletree in its forward position, a brake-beam supported adjacent to the rear axle, brake-shoes at either end of the beam, pairs of oppositely-disposed toggle-levers connecting the ends of the brake-beam with the rear axle, rods connecting the joints of the corresponding levers, toggle-levers connecting the joints of the respective pairs of levers, a rod connecting the joints of the last-named toggle-levers, a pulley on the rod, a cable secured to the pulley on the last-named rod and passing around the first-named rods and under the pulley to the doubletree, a spring secured to the brake-beam, a screw-threaded rod traversing the rear axle and connected with the spring, and a crank for manipulating the rod.



2. In a wagon-brake, the combination of the front and rear axles, a tongue connected with the front axle, a doubletree slidably mounted on the tongue, means for retaining the doubletree in its forward position, a brake-beam supported adjacent to the rear axle, brake-shoes at either end of the beam, pairs of oppositely-disposed toggle-levers connecting the ends of the brake-beams with the rear axle, rods connecting the joints of the corresponding levers, toggle-levers connecting the joints of the respective pairs of levers, a rod connecting the joints of the last-named toggle-levers, a cable encircling the rods and connected to the doubletree, a spring connecting the brake-beam with the rear axle, and means for adjusting the spring.

3. In a wagon-brake, the combination with the front and rear axle, a tongue connected with the front axle, a doubletree slidably mounted on the tongue, means for maintaining the doubletree in its forward position, a brake-beam supported adjacent to the rear axle, toggle-levers connecting the ends of the brake-beam with the rear axle, means for maintaining the toggle-levers normally broken, and means connecting the doubletree and the toggle-levers for extending the same.

4. In a wagon-brake, the combination of the front and rear axle, the tongue connected with the front axle, a doubletree slidably mounted on the tongue, a brake supported adjacent to the rear axle, toggle-levers connecting the brake with the rear axle, means for maintaining the toggle-levers normally broken, and means connecting the doubletree and the toggle-levers for extending the same.

5. In a wagon-brake, the combination with the front and rear axles, the tongue connected with the front axle, a doubletree slidably mounted on the tongue, braking mechanism supported adjacent to the rear axle, toggle-levers connecting the braking mechanism with the rear axle, means for maintaining the toggle-levers normally broken, and means connected with the doubletree for extending the same.

6. In a wagon-brake the combination with the front and rear axles of a doubletree associated with the front axle, braking mechanism, toggle-levers connecting the braking mechanism with the rear axle, means for maintaining the toggle-levers normally broken,

and means whereby traction on the doubletree may extend the toggle-levers to relax the brake.

7. In a wagon-brake, the combination with the front and rear axles, a normally operative brake, toggle-levers connecting the brake with the rear axle, and means whereby traction on the doubletree may extend the toggle-levers to relax the brake.

809,152. PIPE-WRENCH. GEORGE W. WATTS, San Francisco, Cal., assignor to Benjamin F. Watts, trustee, San Francisco, Cal. Filed Aug. 28, 1899. Renewed June 8, 1905. Serial No. 264,236.

Claim.—1. A wrench comprising a two-part handle and two jaws, each jaw forming a part and continuation of one member of the handle, one jaw having a toothed surface in line with its handle member, and the other jaw having a plain surface permanently at an angle to its handle member, and to the toothed jaw, means for adjusting the jaws, and a hinge-joint connecting the handle members.

2. A wrench comprising a two-part handle and two jaws, each jaw forming a part and continuation of one member of the handle, one jaw being in line with its handle member, and having a recess and a superficially-toothed plate in said recess, and the other jaw having a plain surface permanently at an angle to its handle member and to the toothed jaw, means for adjusting the jaws, and a hinge-joint connecting the handle members.

809,153. JOINT FOR BRACELETS. NILS C. WALLENSTEIN, Central Falls, R. I., assignor to J. M. Fisher & Company, a Firm. Filed Sept. 5, 1905. Serial No. 276,960.

Claim.—1. A bracelet constructed of tubing and having a joint formed of two separate hinge members, and said members having engaging means for positively drawing the hinged portion of the bracelet tightly together as said bracelet is closing.

2. A bracelet constructed of tubing and having a joint formed of two separate members fixed into the ends of said tubing, and said members having means whereby one of said members engages the other to positively draw the hinged portion of the bracelet tightly together as said bracelet is closing.

3. A bracelet, constructed of tubing, and having a joint formed separate and inserted into said tubing said joint being composed of two interlocking members and a link connecting said members together.

4. In a bracelet, a joint composed of two interlocking members, a pivoted link loosely connecting said members together, and means for drawing the joint tightly together when the bracelet is closed.

5. In a joint for a bracelet, a tongue member, a grooved member, the tongue in said first-named member adapted to engage and reciprocate in the groove in said second-named member, and a link connecting said members together.

6. A bracelet constructed of tubing and having a joint comprising two interlocking members, a swinging link connecting said members together, and means in said members whereby the ends of said tubing will be brought tightly together when the bracelet is closed.

7. In a joint for a bracelet, a tongue member, a grooved member, the tongue in said first-named member adapted to engage and reciprocate in the groove in said second-named member, a link connecting said members together, means in said members whereby they will be drawn together when closed, and means in said members for limiting the extent of opening of the hinge.

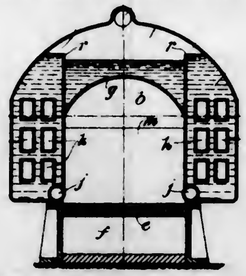
8. A bracelet constructed of tubing and having a joint comprising a member fixed into one end of the tubing, a second member fixed into another end of the said tubing, means including a swinging link for connecting these two members together, and means in said members whereby the ends of said tubing will be drawn together when the bracelet is closed.

9. A bracelet constructed of tubing and having a joint comprising a grooved member fixed into one end of the tubing, a tongue member fitted into another end of said tubing, said tongue being adapted to engage and reciprocate in the groove in said grooved member, a swinging link adapted to connect these two members together, and means in said members whereby the ends of said tubing will be brought tight together when the bracelet is closed.

10. A bracelet constructed of tubing and having a joint comprising a member fixed into one end of the tubing, a second member fixed in another end of the tubing, means including a swinging link for connecting these two members together, a hooked end piece in one of said members, a protuberance on the other member having a wall slanting from its apex away from the end of the tube, whereby said hooked member is adapted to hook over and engage said slanting wall to draw the two members together while the bracelet is being closed.

11. A bracelet constructed of tubing and having a joint comprising a grooved member fixed into one end of the tube, a tongue member fitted into an adjacent end of said tube, said tongue being adapted to engage and reciprocate in the grooved portion of said grooved member, a swinging link adapted to connect these two members together, the grooved member having a hooked end, a protuberance on the other member having a wall slanting from its apex away from the end of the tube whereby said hooked end is adapted to engage said slanting wall to draw the two members tightly together when the bracelet is being closed.

809,154. HEATING APPARATUS. WILLIAM S. WASHBURN, Brockton, Mass. Filed Aug. 23, 1905. Serial No. 275,397.



Claim.—1. In a heating system for buildings, a heating apparatus having a main heating portion located in close proximity to the main source of heat and adapted to be connected with the supply end of a system of heating-pipes, and a preliminary heating portion located beside said main heating portion, having provisions at its lower part for connection with the return end of the system and opening at its upper part into the main heating portion, whereby the water supplied by the return-pipe is caused to rise in the preliminary heating portion and then to flow into the main heating portion, where it receives the final increment of heat.

2. In a heating system for buildings, a heating apparatus having a main heating portion and a preliminary heating portion opening into, and located below the top of, the main heating portions, said portions having provisions for connection respectively with the supply and return ends of the heating system, and the main heating portion being close to the hottest part of the fire and so arranged that the hottest water is acted upon only by the hottest gases and is protected from contact with the cooler gases, while the preliminary heating portion is arranged to be acted on by gases which have delivered a part of their heat to the main heating portion.

3. In a heating system for buildings, a heating apparatus having a main heating portion located in close proximity to the main source of heat and adapted to be connected with the supply end of a system of heating-pipes, a preliminary heating portion located beside said main heating portion, having provisions at its lower part for connection with the return end of the system and opening at its upper part into the main heating portion, and a gas-outlet leading from the fire-space through the preliminary heating portion, whereby the water supplied by the return-pipe is first heated partially by the products of combustion and caused to rise in the preliminary heating portion and then to flow into the main heating portion, where it receives the final increment of heat.

4. In a heating system for buildings, a heating apparatus having a main heating portion located in close proximity to the main source of heat and adapted to be connected with the supply end of a system of heating-pipes, a preliminary heating portion located beside said main heating portion, having provisions at its lower part for connection with the return end of the system and opening at its upper part into the main heating portion, and a system of passages leading from the fire-space through the preliminary heating portion to an outlet, for conducting through such portion the products of combustion after they have given up a portion of their heat to the water in the main heating portion, whereby the water supplied by the return-pipe is first heated partially by the products of combustion and caused to rise in the preliminary heating portion and then to flow into the main heating portion, where it receives the final increment of heat.

5. A heating apparatus for buildings, having a main heating portion in close proximity to the main source of heat and adapted to be connected with the supply end of a system of heating-pipes, a preliminary heating portion located beside the main heating portion and below the top thereof, having provisions at its lower part for connection with the return end of the system and opening at its upper part into the main heating portion, and flues leading from the fire-chamber through the preliminary heating portion, and surrounded by the water therein, to an outlet for carrying off the products of combustion, whereby the water supplied by the return-pipe is heated partially and caused to flow upwardly through the preliminary heating portion into the main heating portion where it receives the final increment of heat, and whereby a relatively low level of water in the heater is permitted.

6. A steam-heating apparatus for buildings, having a steam-generating chamber in close proximity to the main source of heat, a water-receiving portion located mainly below the water-level in the steam-chamber, having provisions at its lower part for connection with the return end of a system of heating-pipes and opening at its upper part into the steam-chamber, and passages leading from the fire-box through the preliminary heating portion to an outlet for conducting therethrough the products of combustion after they have delivered a part of their heat to the water in the steam-chamber, where by the return-water is heated and a low water-level in the heater permitted.

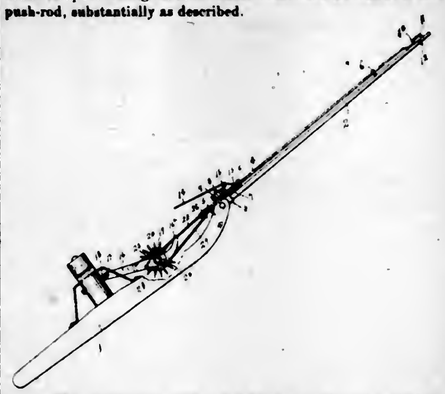
7. In a heating system a heating apparatus having a main heating portion located in close proximity to the main source of heat and adapted to be connected with the supply end of a system of heating-pipes, a preliminary heating portion beside and below the main heating portion having provisions at its lower part for connection with the return end of the heating system and having an opening at its upper part communicating with the main heating portion, and a wall or partition in the main heating portion connected to the walls thereof and extending laterally across said opening and downward below the water-level, there being provided a vent-space between the upper edge of said wall or partition and the top of the main heating portion.

809,155. AUTOMATIC BRAKE FOR SLEDS. BENJY M. WHEARE, Balsam Lake, Wis. Filed Apr. 22, 1905. Serial No. 256,527.

Claim.—1. The combination with a sled, of a toothed head movable into and out of contact with the road-bed, a variable-action friction member operative to frictionally resist the rotation of said toothed wheel, and a connection for moving said head into contact with the road-bed and for setting the frictional brake under a frictional tension depending on the force transmitted through said operating connection, substantially as described.

2. The combination with a sled having a pole, of a push-rod having a limited movement on said pole, a draft-equalizer applied to the rear portion of said push-rod, a neck-yoke operative on the forward end of said push-rod, a pivoted frame applied to said sled, a toothed wheel carried by the free end of said frame and engageable with the road-bed, a friction-brake operative to resist rotation of said toothed head, and a connection from the said push-rod to said friction-brake, for setting said brake under a rearward movement of the said push-rod, substantially as described.

3. The combination with a sled having a pole, of a frame pivoted to said sled with its free end projecting forward and transverse shaft journaled in the free portion of said pivoted frame, a pair of toothed heads carried by said shaft and engageable with the road-bed, a friction-drum on said shaft, a brake-strap attached at one end of said frame and working on the periphery of said friction-drum, a push-rod extending along said pole, and having a longitudinal movement with respect thereto, a draft-equalizer applied to the rear portion of said push-rod, neck-yoke operating on the forward end of said push-rod, a rod attached to the rear end of said push-rod, and with the free end of said pivoted frame for raising the latter and said toothed heads under a forward movement of said push-rod, and a rod attached to the rear end of said push-rod and to the free end of said brake-strap for setting the brake under a rearward movement of said push-rod, substantially as described.



4. The combination with a sled having a pole and a chafing-plate applied to the rear portion of said pole, and a frame 16 pivotally attached at its rear end to said sled, a shaft 19 loosely journaled in the forward portion of said frame 16, and provided with toothed heads 20, and with the intermediate friction-drum 21, brake-strap 22 attached at one end to said frame 16 and frictionally engaging the periphery of said drum 21 and push-rod 4 having a sliding movement on said pole, a draft-equalizer applied to the rear portion of said push-rod and neck-yoke, operative on the forward portion of said push-rod, a spring-latch cooperating with said chafing-plate 7 to hold said push-rod in a forward position, said push-rod having a head at its rear end for limiting its forward movement, a rod 29 attached to the rear end of said push-rod 4, and into the free end of said frame 16 for raising said toothed heads out of contact with the road-bed under a forward movement of said push-rod, and the rod 25 attached to the rear end of said push-rod 4, and connected to the free end of said brake-strap 22 and serving to set the brake under a rearward movement of said push-rod 4, substantially as described.

809,156. EYEGLASS-MOUNTING. GEORGE W. WELLS, Southbridge, Mass. Filed May 26, 1905. Serial No. 263,336.

Claim.—1. In an eyeglass-mounting, a post of flat or non-circular shape in cross-section, and having two attaching lugs or projections on each end thereof.

2. In an eyeglass-mounting, a post having two attaching lugs or projections on each end thereof.

3. In an eyeglass-mounting, the combination with a lens strap or rim, having an opening therein, and the nose-bridge and nose-guard, each having an opening in its attaching end, of a post having an attaching lug or projection on each end, to enter said opening in the strap or rim and said openings in the attaching end of the nose-bridge and nose-guard, and be secured therein.

4. In an eyeglass-mounting, the combination with the lens-strap having an opening therein, and the nose-bridge and nose-guard, each having an opening in its attaching end, of a post of flat or non-circular shape in cross-section, and having an attaching lug or projection on each end, to enter said opening in the strap and said openings in the attaching end of the nose-bridge and nose-guard, and be riveted therein.

3. In an eyeglass-mounting, the combination with a lens strap or wire, and the nose-bridge and nose-guard, each having an opening in its attaching end, of a post secured to the lens strap or wire, and having an attaching lug or projection thereon, to enter the openings in the attaching end of the nose-bridge and nose-guard, and be secured therein.

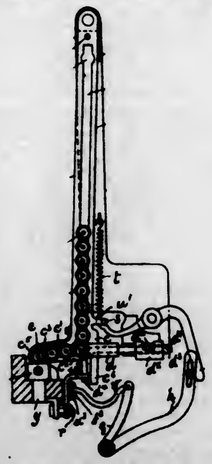
809,157. PHOTOMECHANICAL MULTICOLOR-PRINTING. MAURICE H. WEIL, Philadelphia, Pa. Filed Dec. 17, 1903. Serial No. 186,804.

Claim.—1. An improved process of photomechanical multicolor-printing, which consists in first preparing the required set of primary color-positives of the object or picture sought to be reproduced, and then preparing therefrom the negatives which are transferred to stone or copper, by interposing in the production of each negative in the set for a multicolor impression a single screen prepared with an irregular, grain or stipple pattern and which is thereby adapted to be so used without shifting its position during each of the several exposures; substantially as described.

2. An improved process of photomechanical multicolor-printing, which consists in preparing primary color-negatives for transfer to copper or stone, by simultaneously interposing in the production thereof the requisite color-filter for each negative in the set and a single screen etched or otherwise prepared with an irregular, grain or stipple pattern and which may be maintained in one position and without shifting during the exposure; substantially as described.

3. An improved process of producing photomechanical multicolor-prints, without line effects, which consists in preparing the copper or stone printing-surfaces from a set of negative films in the production of each of which the requisite color-filter and a screen of irregular, grain or stipple pattern has been interposed; and then producing the finished picture by superposing impressions from said plates or stones, one over the other, in proper register; substantially as described.

809,158. WEFT-REPLENISHING LOOM. CHRISTOPHER WHALLEY, Clitheroe, England. Filed July 21, 1905. Serial No. 269,494.



Claim.—1. Apparatus for automatically replenishing the weft in loom-shuttles, comprising a bracket, a magazine for containing cops, consisting of an L-shaped frame suspended from said bracket, said magazine adapted to swing from its point of suspension toward the slay, and means adapted to force a cop into the shuttle from the mouth of said magazine as it swings from said slay.

2. A magazine for automatic weft-replenishing looms, comprising a swinging L-shaped slotted bar supporting a number of cops and feed means for forcing the cop at the bottom of the slotted bar from the magazine as it swings, into a shuttle, upon the failure of a cop therein.

3. A magazine for automatic weft-replenishing looms, comprising a slotted L-shaped pivoted frame, a projection *d* in the path of said slot in the lower leg of the L-shaped frame, and means for oscillating said frame upon the failure of the weft, in combination with the slay and shuttle and means to bring the shuttle beneath the open end of the slotted frame and to engage said frame to move it against said projection, whereby a spindle with a cop thereon will be forced from the frame into the shuttle.

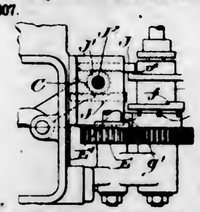
809,159. DISPENSING BOTTLE OR JAR. RICHARD M. WILLIS, New York, and ALONZO A. DU MOND, Rochester, N. Y.; said Du Mond assignor to said Willis. Filed Sept. 20, 1905. Serial No. 279,235.

Claim.—1. A hermetically-sealed bottle or jar, provided at each end with a narrow discharge-aperture ordinarily closed by a breakable closure, substantially as described.

2. A hermetically-sealed bottle or jar made of a single piece of glass and provided with breakable ends and weakened portions near said ends, discharge-apertures being left when said ends are broken off, substantially as described.

3. A bottle or jar with its top hermetically sealed and provided with a weakened portion and with a sealed portion, and with the bottom provided with a projecting portion which can be easily broken off, substantially as described.

809,160. MECHANICAL MOVEMENT. RICHARD T. WINGO, Providence, R. I., assignor to Brown and Sharpe Manufacturing Company, Providence, R. I., a Corporation of Rhode Island. Filed May 31, 1905. Serial No. 263,007.



Claim.—1. The combination with a clutch, of rotary and non-rotary members coöperating to disengage said clutch and hold it out of operation, means for withdrawing a non-rotary member from engagement with a rotary member and simultaneously moving a non-rotary member into the path of a rotary member, substantially as described.

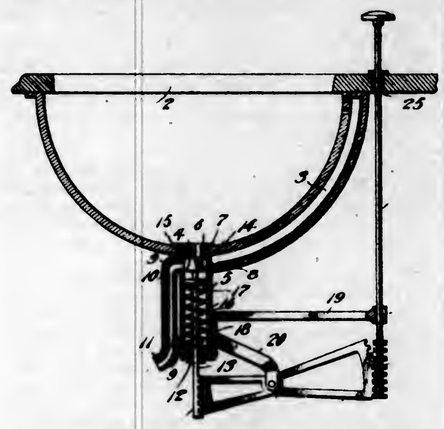
2. The combination with a clutch, of one or more cams, carried by the clutch, one or more abutments for coöperating therewith to hold the clutch out of operation, means for disengaging an abutment from a cam to release the clutch and simultaneously moving an abutment into position to throw the clutch out of operation, substantially as described.

3. The combination with a clutch, of one or more cams carried by the clutch, two abutments coöperating therewith to hold the clutch out of operation, connections between the abutments for moving one into the path of a cam as the other is disengaged from a cam, substantially as described.

4. The combination with a clutch, of a plurality of cams carried by the clutch, two abutments for coöperating therewith to hold the clutch out of operation, connections between the abutments for moving one into the path of the cam as the other is disengaged from a cam, substantially as described.

809,161. WASHBOWL-VALVE. DAVID W. YORK, Gardiner, Me. Filed Apr. 28, 1905. Serial No. 257,851.

Claim.—1. A bowl provided with a discharge-opening and a by-pass, a valve-casing having its upper end positioned within said discharge-opening and provided with a waste-pipe formed integral therewith and having communication at an upper and lower point with the valve-casing, said valve-casing being provided with an opening arranged in alinement with said by-pass, a valve mounted within said casing, and means for operating the same.



2. A water-bowl provided with a discharge-opening and a by-pass, a valve-casing having its upper end positioned within said discharge-opening and provided with a waste-pipe having communication at an upper and lower point with said valve-casing, said casing being provided with an opening arranged in alinement with said by-pass, a bearing-nut threaded in the lower end of said valve-casing, a valve-rod having its lower end provided with a rack and having its upper end journaled within said bearing-nut and positioned within the casing, a valve carried by the upper end of said rod, a spring adapted to normally retain the valve seated, a bracket carried by said casing and provided with a horizontally and a downwardly projecting bracket-arm, a rocking element consisting of two diametrically-opposed segmental gear elements, one of said gear elements being in mesh with the rack portion of the valve-rod, and an operating-bar journaled in a bearing in a horizontal bracket-arm and provided with a rack in mesh with the other segmental gear element.

809,162. CIGAR. CHARLES F. SENKER, New York, N. Y. Filed Dec. 9, 1904. Serial No. 236,063.

Claim.—1. A cigar having its butt-end compressed around and adjacent to the wrapper and binder and formed with a loose projecting figure integral with the filler, said figure being inclosed by the compressed portion, whereby the cigar is sealed against escape of moisture and an igniting-surface provided, substantially as described.

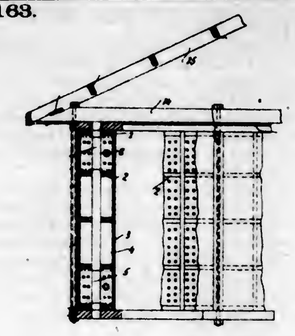
2. A cigar having its butt-end compressed at the edges thereof, and a projecting portion surrounded by the compressed portion and provided with perforations that extend back into the body of the cigar.

809,163. DEMOUNTABLE BUILDING. JOHANN ARAM, Prakfalu, Austria-Hungary. Filed Dec. 27, 1904. Serial No. 238,478.

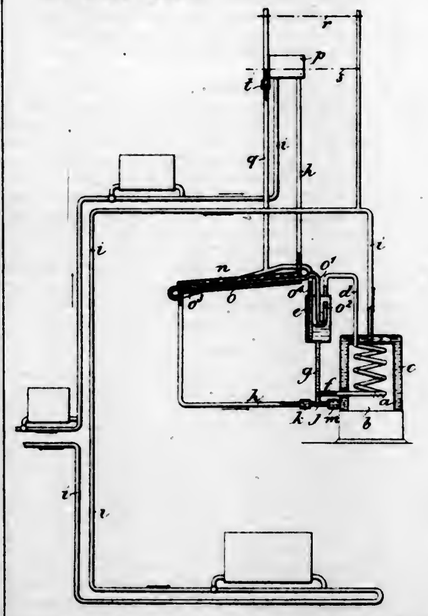
Claim.—1. A knockdown building comprising in its construction a floor-frame and a ceiling-frame, building units arranged in pairs, one behind the other between said floor and ceiling frames and connected by transverse cross-bars at desired distances apart, each of said units consisting of a wooden frame having a foraminous metal sheet secured thereto and provided with a casting of artificial stone, and means for connecting said units together in the edgewise relation.

2. A knockdown building comprising in its construction a series of beams each one of which has secured to one end an angle-iron provided at one end with projections, and rafters resting at one end on said beams, said rafters being arranged in pairs secured together transversely by screws and provided with angle-irons engaging the projections on the angle-irons on one or the other of said beams.

809,163.



809,164. HOT-WATER HEATING APPARATUS. WARWICK H. BEANES and HUGH WALTON, Peterborough, England. Filed Mar. 28, 1905. Serial No. 252,456.



Claim.—1. Hot-water heating apparatus comprising a hot-water-circulating conduit including a water-heater, a separate steam-generator, a water-displacement vessel arranged outside of and connected to said steam-generator and to said conduit, a condenser adapted to be placed in connection with said vessel each time a predetermined quantity of water is forced therefrom into said conduit, and valves arranged to cause the water to flow in the proper direction through said conduit.

2. Hot-water heating apparatus comprising a water-circulating conduit including a water-heater, a separate steam-generator connected to said conduit, a water-displacement vessel connected at its upper end to said steam-generator and at its lower end to said conduit, a condenser adapted to be connected to said displacement vessel each time a predetermined quantity of water is forced therefrom into said conduit, and valves arranged to cause the water to circulate through said conduit but not through said steam-generator.

3. Hot-water heating apparatus comprising a water-circulating conduit including a water-heater and provided with water-controlling valves, a combined water-displacement vessel and steam-generator arranged external to said conduit but connected thereto at one point, and a condenser adapted to be placed in communication

with said vessel each time a predetermined quantity of water is forced therefrom into said conduit.

4. Hot-water heating apparatus comprising a water-circulating conduit including a water-heater and controlling-valves, a displacement vessel connected to said conduit between two of said valves, a separate steam-generator having its upper and lower ends in communication with the upper and lower ends respectively of said vessel, and a condenser adapted to be placed in communication with said vessel each time a predetermined quantity of water is forced therefrom into said conduit.

5. Hot-water heating apparatus comprising a water-circulating conduit including a water-heater and two non-return valves opening in the same direction, a water-displacement vessel connected to said conduit between said valves, a separate steam-generator of small capacity having its upper and lower ends in communication respectively with the upper and lower ends of said vessel, and a condenser adapted to be placed in connection with said vessel each time a predetermined quantity of water is forced therefrom into said conduit.

6. In hot-water heating apparatus the combination with a water-circulating conduit including a water-heater and non-return valves opening in the same direction, of a water-displacement vessel having a discharge-pipe connected to said conduit between said valves, a steam-generator of relatively small capacity connected at its upper end to said vessel and at its lower end to said discharge-pipe, and a condenser adapted to be placed in connection with said vessel each time a predetermined quantity of water is forced therefrom into said conduit.

7. Hot-water heating apparatus comprising a water-circulating conduit including a water-heater and two non-return valves opening in the same direction, a water-displacement vessel connected to said conduit between said valves, a separate steam-generator of small capacity having its upper and lower ends in communication respectively with the upper and lower ends of said vessel, a downtake-pipe arranged external to said vessel and connecting the top and bottom of said steam-generator, and a condenser adapted to be placed in connection with said vessel each time a predetermined quantity of water is forced therefrom into said conduit.

8. Hot-water heating apparatus comprising a water-circulating conduit including a water-heater and two non-return valves opening in the same direction, a water-displacement vessel connected to said conduit between said valves, a separate steam-generator of small capacity having its upper and lower ends in communication respectively with the upper and lower ends of said vessel, a downtake-pipe arranged external to said vessel and connected to the lower end of said steam-generator, a U-shaped tube connecting the upper end of said pipe to the top of said steam-generator, and a condenser adapted to be placed in connection with said vessel each time a predetermined quantity of water is forced therefrom into said conduit.

9. Hot-water heating apparatus comprising a water-circulating conduit including a water-heater and two non-return valves opening in the same direction, a water-displacement vessel connected to said conduit between said valves, a separate steam-generator of small capacity having its upper end in communication with the top of said vessel, a downtake-pipe arranged external to said vessel and connecting the top and bottom of said steam-generator, a tube connecting the bottom of said steam-generator to the bottom of said vessel, and a condenser adapted to be placed in connection with said vessel each time a predetermined quantity of water is forced therefrom into said conduit.

10. Hot-water heating apparatus comprising a water-circulating conduit including a water-heater and two non-return valves opening in the same direction, a water-displacement vessel having a water-discharge pipe extending from its lower end and connected to said conduit between said valves, said discharge-pipe being bent so as to extend upward to a point above said vessel and then downward to said conduit, a steam-generator of small capacity having its upper end in communication with the top of said vessel, a downtake-pipe arranged external to said vessel and connecting the top and bottom of said steam-generator, a pipe extending downward through said downtake-pipe and connected at its upper end to the upper portion of said bent discharge-pipe, and a condenser adapted to be placed in connection with said vessel each time a predetermined quantity of water is forced therefrom into said conduit.

11. In hot-water-circulating apparatus, the combination with a water-circulating conduit including a water-heater and two non-return valves opening in the direction in which the water is to flow, of a water-displacement vessel, a water-discharge pipe connecting the bottom of said vessel to said conduit at a part thereof between said valves, a steam-generator of small capacity located in the combustion-chamber of said heater and having its upper end connected to the top of said vessel and its lower end in communication with said conduit between said valves, and a condenser adapted to be placed in communication with said vessel each time a predetermined quantity of water is forced therefrom into said conduit.

12. In hot-water-circulating apparatus, the combination with a water-circulating conduit including a water-heater and two non-return valves opening in the direction in which the water is to flow, of a water-displacement vessel, a water-discharge pipe connecting the bottom of said vessel to said conduit at a part thereof between said valves, a steam-generator of small capacity located in the combustion-chamber of said heater and having its upper end connected to the top of said vessel and its lower end in communication with said conduit between said valves, a downtake-tube arranged external to said vessel and connecting the top and bottom of said steam-generator, and a condenser adapted to be placed in communication with said vessel each time a predetermined quantity of water is forced therefrom by steam into said conduit.

13. In hot-water-circulating apparatus, the combination with a water-circulating conduit including a water-heater and two non-return valves opening in the direction in which the water is to flow, of a water-displacement vessel, a water-discharge pipe connecting the bottom of said vessel to said conduit at a part thereof between said valves, said pipe being bent so as to extend upward to a point above said vessel and then downward, a steam-generator of small capacity located in the combustion-chamber of said heater and having its upper end connected to the top of said vessel, a downtake-pipe arranged external to said vessel and connecting the lower end of said steam-generator to the upper end thereof, a pipe extending downward through said downtake-pipe and connected at its upper end to the upper portion of said bent discharge-pipe, and a condenser adapted to be placed in communication with said vessel each time a predetermined quantity of water is forced therefrom by steam into said conduit.

14. Hot-water heating apparatus comprising a water-circulating conduit including a water-heater and two non-return valves arranged in the return portion of said conduit and opening toward said heater, a water-displacement vessel arranged to discharge into said conduit between said valves, a separate steam-generator of relatively small capacity connected to the top of said vessel, and a condenser adapted to be connected to said vessel each time a predetermined quantity of water is forced therefrom into said conduit.

15. Hot-water heating apparatus comprising a water-circulating conduit including a water-heater and two non-return valves arranged in the return portion of said conduit and opening toward said heater, a water-displacement vessel arranged to discharge into said conduit between said valves, a separate steam-generator of relatively small capacity connected to the top of said vessel and having its lower end in communication with said conduit between said valves, and a condenser adapted to be connected to said vessel each time a predetermined quantity of water is forced therefrom by steam into said conduit.

16. Hot-water heating apparatus comprising a water-circulating conduit including a water-heater arranged between its delivery and return portions, and an expansion-tank arranged at the highest point, non-return valves arranged in the return portion of the conduit and opening toward said water-heater, a displacement vessel, a discharge-pipe connecting the lower end of said vessel to said conduit between said valves, said pipe being bent upward to a point above said vessel and then downward, a steam-generator of small capacity located in the combustion-chamber of said heater and connected to the top of said vessel, a downtake-pipe between the top and bottom of said steam-generator, a pipe connecting the bottom of said steam-generator and downtake-pipe to the upper bent portion of said discharge-pipe, and a condenser adapted to be placed in connection with said vessel each time a predetermined quantity of water is forced therefrom into said conduit.

17. Hot-water heating apparatus comprising a water-circulating conduit including a water-heater, a separate steam-generator, a water-displacement vessel having its upper end in connection with said steam-generator and its lower end in communication with said conduit, a condenser adapted to be placed in communication with said vessel when a predetermined quantity of water has been forced therefrom into said conduit, said condenser comprising a water-chamber forming part of said conduit, and valves arranged to cause the water to flow in the proper direction through said conduit.

18. Hot-water heating apparatus, comprising a water-circulating conduit including a water-heater, a separate steam-generator, a water-displacement vessel having its upper end in communication with the upper end of said steam-generator and its lower end in communication with the lower end of the steam-generator and with said conduit, a condenser comprising a tube having one end arranged to be placed in communication with the upper part of said vessel when a predetermined quantity of water has been forced therefrom, connecting means whereby the other end of the condenser-tube can be placed in communication with the bottom of said vessel, said connecting means being adapted to prevent circulation of water through said vessel and tube, and valves arranged to cause water to flow in the proper direction through said conduit.

19. Hot-water heating apparatus comprising a water-circulating conduit including a water-heater, a separate steam-generator of small capacity, a water-displacement vessel having its upper end in communication with said steam-generator and its lower end in communication with the lower end of said steam-generator and with said conduit, a condenser arranged to be placed in communication with said vessel when a predetermined quantity of water has been forced therefrom into said conduit, a vent-pipe with controlling-valve to allow of escape of air, or steam, or both, from said condenser, and valves arranged to cause water to flow in the proper direction through said conduit.

20. In hot-water heating apparatus the combination with a water-circulating conduit including a water-heater, of a water-displacement vessel connected at its lower end to said conduit, a steam-generator and a condenser arranged in shunt-circuits to said vessel, and non-return valves arranged in said conduit at opposite sides of the point of connection thereto of said vessel; the inlet to said condenser being arranged to admit steam thereto from said vessel when the level of water in the latter falls to a predetermined point.

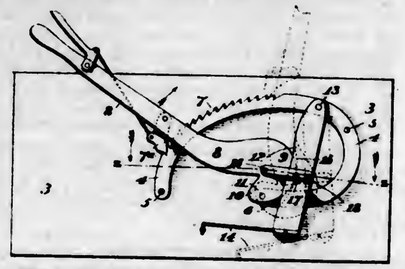
21. In hot-water heating apparatus the combination with a water-circulating conduit including a water-heater, of a water-displacement vessel connected at its lower end to said conduit, steam generating and condensing tubes arranged in shunt-circuits to said vessel, the steam-generating tube being of small internal capacity and arranged in the combustion-chamber of said heater, and the steam-inlet to the condensing-tube being arranged to be uncovered when the level of water in said vessel has been depressed to a predetermined point.

22. Hot-water heating apparatus comprising a water-circulating conduit including a water-heater and having an expansion-tank at its highest part, a water-displacement vessel having its lower end connected to the delivery portion of said conduit, a separate steam-generator connected to the top and bottom of said vessel, a condenser comprising a chamber arranged to form part of the circulating-conduit, and a condenser-tube the inlet end of which is bent to a U shape and located in the upper part of said vessel, connecting means between the other end of said condenser-tube and the bottom of said vessel and adapted to prevent circulation of water through said vessel and tube, and valves for constraining water to flow in the proper direction in the said circulating-conduit.

23. In hot-water heating apparatus, the combination with a hot-water-circulating conduit including a water-heater and having an expansion-tank at its highest part, of a steam-generating tube of relatively small internal capacity arranged within the combustion-chamber of said water-heater, a water-displacement vessel having its upper end in communication with said steam-generating tube and its lower end in communication with said conduit and with the lower end of said steam-generating tube, a steam-condenser comprising a condenser-chamber arranged to form part of said conduit, and a condenser-tube having one end bent to a U shape and located in the upper part of said vessel, connecting means between the other end of said condenser-tube and the bottom of said vessel, said connecting means being adapted to prevent water circulating through said vessel and condenser-tube, a vent-pipe that is in communication with said condenser-tube and extends to a higher level than the water in said expansion-tank, a non-return valve controlling said vent-pipe, and non-return valves arranged to constrain the water to flow in the proper direction through said conduit.

24. In hot-water heating apparatus, the combination with a hot-water-circulating conduit including a water-heater, two non-return valves opening toward said heater, and an expansion-tank at its highest part, of a separate steam-generator arranged to receive a supply of water from the conduit, a water-displacement vessel having its upper end in communication with said steam-generator and its lower end in communication with the lower end of said steam-generator and with the return portion of said conduit between said non-return valves, a condenser comprising a chamber arranged to form part of the water-circulating conduit, a condenser-tube extending through said chamber and having one end bent to a U shape and located in the upper part of said vessel, an upwardly-extending pipe connected to the other end of said condenser-tube, a pipe connecting the upper end of the last-mentioned tube to the bottom of said displacement vessel, and a vent-pipe connected to the said upwardly-extending tube.

809,165. BRAKE MECHANISM. HENRY S. BENNET, Bliss, Ill. Filed June 26, 1905. Serial No. 267,206.

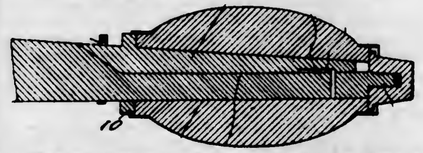


Claim.—1. A lever having a laterally-projecting arm near its end, and on which it is fulcrumed, and a rounded end continuing to the arm, in combination with a pivoted link, and straps connecting said arm and link, whereby said rounded arm end is held in contact with said link.

2. A lever having a laterally-projecting arm near its end and on which it is fulcrumed and a rounded end continuing to the arm, in combination with a pivoted link and means whereby said link is held in contact with said lever, said link having in its side adjacent to the lever a groove in which said rounded lever end is operable.

3. Mechanism of the character described, comprising a ratchet-bar having one end curved under itself, a lever terminating in a laterally-projecting arm and a rounded end continuing to the arm and fulcrumed at the end of the arm to the lower part of said ratchet-bar, a link pivoted to the upper part of said ratchet-bar and having on its side adjacent to the lever a groove in which said rounded lever end is operable, straps connecting said lever and link, means at the lower end of said link whereby the mechanism to be operated is moved, and a pawl on said lever and cooperating with said ratchet-bar.

809,166. WAGON-SPINDLE. ALBERT J. BELIEL, Mulhall, Okla. Filed June 16, 1905. Serial No. 265,560.



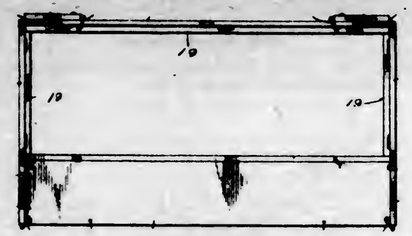
Claim.—1. A wagon-spindle comprising upper and lower portions arranged for longitudinal movement with respect to each other, a collar carried by one portion and slidably engaged with the other portion, means for holding the two portions at different points of their movement with respect to each other, and means for holding the portions against lateral movement with respect to each other.

2. A spindle comprising a portion having a flat face and a tapered curved face, said flat face extending at an angle to the central longitudinal axis of the spindle, a member having a flat and a curved face disposed with its flat face against that of the first-named portion for longitudinal movement thereupon, a surrounding collar carried by the member and extending beyond the flat face thereof, said collar having an opening therein in which the first-named portion of the spindle is slidably engaged, said member having a longitudinal groove in its flat face, a pin carried by the first-named portion and slidably engaged in the groove and means for holding the member at different points of its movement.

809,167. FOLDING BEDSTEAD. HENRY H. BLAYLOCK, Hountonville, N. C. Filed Aug. 4, 1905. Serial No. 272,067.

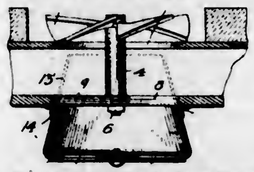
Claim.—1. A bedstead comprising head and foot boards, wings hingedly connected to the opposite side edges of the said boards, a bottom connecting the head and foot boards and hinged leaves arranged one upon each side of said footboard, means for locking the

said leaves beneath the bottom, and means for fastening the respective leaves against the corresponding sides of said bottom.



2. A bedstead comprising a head and foot board, a bottom connecting the head and foot boards, hinged wings connected with the head and foot boards and hinged leaves connected with the bottom for coöperation with said wings whereby the bedstead may be converted into a single or double bedstead.

809,168. **SMOKE-CONSUMER.** GEORGE M. BOOTH, Baltimore, Md. Filed July 7, 1905. Serial No. 268,696.



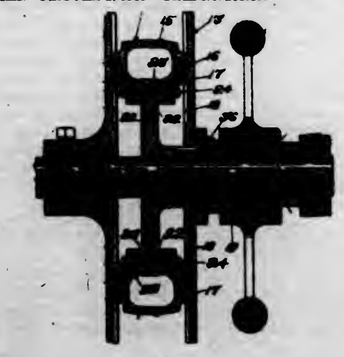
Claim.—1. In combination with the door of a furnace having a hole for the passage of the air, a turbine-shaped deflector immovably secured to the door on the inside thereof and opposite the hole and arranged to set up a whirling movement of the air and products of combustion substantially as described.

2. In combination with the door of a furnace having a hole for the passage of the air, a turbine-shaped deflector immovably secured to the door on the inside thereof and opposite the hole and arranged to set up a whirling movement of the air and products of combustion, and means for regulating the air-supply thereto, substantially as described.

3. In combination with the door of a furnace having a hole for the passage of the air, a turbine-shaped deflector immovably secured to the door on the inside thereof and opposite the hole and arranged to set up a whirling movement of the air and products of combustion, and a shallow casing provided with air-passages and a valve regulating the air-supply to said passages, substantially as described

4. In combination with the door of a furnace having a hole for the passage of the air, a deflector immovably secured to the door opposite the hole and having a series of turbine-blades, one of said blades being of greater length than the other blades, substantially as described.

809,169. **EXPANSIBLE PULLEY.** JOHN P. BRENNAN, Lawrence, Mass. Filed June 2, 1905. Serial No. 263,401.



Claim.—1. The improved expansible pulley comprising a shaft, a pair of side plates provided with radially-arranged slots, one of said side plates being fast and the other loose on the said shaft, sectors radially movable in the said slots, a cam-disk intermediate the said side plates and provided with a sleeve about the said shaft and extending through said loose side plate, and moving means on the said sleeve by the rotation of which the cam-disk is rotated independently of the side plates.

2. The improved expansible pulley comprising a shaft, a pair of side plates provided with radially-arranged slots therein, one of said side plates being fast to the said shaft, sectors radially movable in the said slots, a single cam-disk intermediate the said side plates and acting upon the said sectors, said cam-disk being provided with a sleeve about the said shaft, and a hand-wheel on the said sleeve by the rotation of which the cam-disk is rotated independently of the said side plates.

3. The improved expansible pulley comprising a shaft, a pair of side plates provided with radially-arranged slots, one of said side plates being fast to the said shaft, sectors radially movable in the said slots, a cam-disk acting upon said sectors and provided with a sleeve about the said shaft, a hand-wheel slidably movable on said sleeve by the rotation of which the said cam-disk is rotated independently of the said side plates, and locking means operated by the longitudinal movement of said hand-wheel.

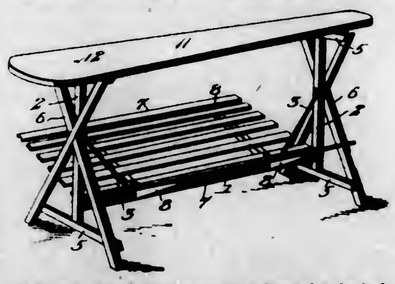
4. In an expansible pulley, the combination with side plates, movable sectors, an adjusting-disk, and locking means, of a hand-wheel slidably mounted on a sleeve of the said adjusting-disk, whereby rotation of the said hand-wheel adjusts the sectors and longitudinal movement operates the locking means.

5. In an expansible pulley, the combination with a pair of side plates provided with radial slots, and sectors radially movable in the said slots, of locking means comprising a bolt, a head for one end of the said bolt, a cam mounted upon the other end of said bolt and engaging one of the said side plates, and moving means for the said cam.

6. In an expansible pulley, the combination with a shaft, a pair of side plates thereon provided with radial slots, and sectors radially movable in the said slots, of locking means comprising a bolt, a head for one end of said bolt, a cam mounted upon the other end of said bolt and engaging one of the said side plates, an arm fast to the said cam, and a hand-wheel slidably mounted with relation to the said shaft and provided with a grooved hub within which the end of the said arm is received, whereby the longitudinal movements of the said hand-wheel with relation to the said shaft cause movement of the said cam to operate the locking means.

7. The improved expansible pulley and locking means therefor, comprising a pair of side plates provided with radial slots, sectors radially movable in the said slots, an adjusting-disk intermediate the said pair of side plates provided with cam-slots therein, said adjusting-disk being also provided with a sleeve about the driving-shaft on which the pulley is mounted, connecting means between the said cam-slots and the said sectors, a hand-wheel slidably mounted upon the sleeve of the said adjusting-disk and adapted to rotate the said adjusting-disk independently of the said side plates, and locking means for the parts of the said expansible pulley operated by the longitudinal movement of the hand-wheel.

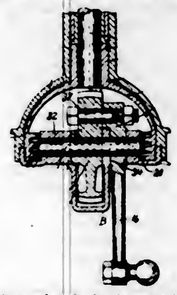
809,170. **COLLAPSIBLE TABLE.** WALTER L. BROADWELL, South Norfolk, Va. Filed June 1, 1904. Serial No. 210,794.



Claim.—1. A table-top, a supporting-frame therefor including a horizontal strip, and a removable shield comprising a pair of sections pivotally connected, said sections having portions adapted to conjointly engage and clamp the strip between them.

2. A table-top, a supporting-frame therefor including a horizontal strip, and a removable shield comprising a pair of sections pivotally connected, said sections having transverse cleats spaced at their inner adjacent ends and adapted to conjointly receive and clamp the strip between them.

809,171. **STEERING DEVICE.** ALEXANDER T. BROWN, Syracuse, N. Y., assignor to Brown-Lipe Gear Company, Syracuse, N. Y., a Copartnership. Filed May 11, 1904. Serial No. 207,463.



Claim.—1. A steering device for vehicles comprising a driving member having internal substantially helical teeth, and a driven member arranged eccentrically relatively to the driving member and provided with teeth engaging the internal teeth at one side of the driving member and separated from said internal teeth at the diametrically opposite side of the driving member, substantially as and for the purpose specified.

2. A steering device for vehicles comprising a driving member movable about an axis and having internal substantially helical teeth, a driven member arranged in alinement with said axis and movable about an axis disposed at an angle to the axis of the driving member and provided with teeth engaging the former teeth, and fixed means for supporting the driven member, substantially as and for the purpose set forth.

3. A steering device for vehicles comprising a driving member formed with a hollow portion having internal teeth, a driven member provided with teeth engaging the internal teeth within the hollow portion of the driving member, and fixed means projecting within said hollow portion for supporting the driven member, substantially as and for the purpose described.

4. A steering device for vehicles comprising a driving member having internal substantially helical teeth, and peripheral engaging faces of unequal diameter, a driven member provided with teeth engaging the former teeth, and a casing having internal faces of unequal diameter for engaging the former faces, substantially as and for the purpose set forth.

5. In a steering device for vehicles, the combination of a driving member having internal substantially helical teeth, and peripheral engaging faces of unequal diameter, and a casing having internal faces of unequal diameter for engaging the peripheral faces opposing surfaces of the driving member and the casing between said engaging faces being separated from each other; with a driven member provided with teeth engaging the former teeth, substantially as and for the purpose described.

6. In a steering device for vehicles, the combination of a driving member having internal substantially helical teeth, and peripheral engaging faces of unequal diameter, and a casing having internal faces of unequal diameter for engaging said peripheral faces, the driving member and the casing having annular shoulders for preventing endwise movement of one of said parts in one direction relatively to the other; with a driven member provided with teeth engaging the former teeth, substantially as and for the purpose set forth.

7. In a steering device for vehicles, the combination of a driving member having internal teeth, a casing comprising separable sections, each having a face engaged with said member, and a driven member provided with teeth engaging the former teeth, substantially as and for the purpose described.

8. In a steering device for vehicles, the combination of a driving member having internal teeth, a casing comprising separable sections, one being adjustable relatively to the other, and a driven member provided with teeth engaging the former teeth, substantially as and for the purpose specified.

9. In a steering device for vehicles, the combination of a driving member movable about an axis and having internal substantially helical teeth, and a casing comprising a main part, and an end section engaging the driving member; with a driven member movable about an axis arranged at an angle to the axis of the driving member and provided with teeth engaging the former teeth, substantially as and for the purpose set forth.

10. In a steering device for vehicles, the combination of a driving member movable about an axis and formed with a hollow portion having internal substantially helical teeth and an opening extending through the wall of said portion, and a casing comprising a main part, and an end section engaging the driving member and closing the end of the hollow portion thereof; with a driven member arranged in alinement with said axis and movable about an axis disposed at an angle to the axis of the driving member and provided with teeth engaging the former teeth, substantially as and for the purpose described.

11. In a steering device for vehicles, the combination of a driving member formed with a hollow portion having internal substantially helical teeth and an opening extending through the wall of said portion, and a casing comprising a main part, and an end section for closing the end of the hollow portion of said driving member, the driving member and the casing having means for preventing endwise movement of one of said parts relatively to the other; with a driven member provided with teeth engaging the former teeth, substantially as and for the purpose set forth.

12. In a steering device for vehicles, the combination of a driving member formed with a hollow portion having internal teeth, a support for the driving member having a part thereof extended within said hollow portion, and a driven member journaled in said part of the support and provided with teeth engaging the former teeth, substantially as and for the purpose specified.

13. In a steering device for vehicles, the combination of a driving member movable about an axis and formed with a hollow portion having internal teeth, and an opening extending through the wall of said portion, means for closing the opening in the hollow portion of the driving member, and a driven member movable about an axis disposed at an angle to the axis of the driving member, said driven member being journaled in said means and provided with teeth engaging the former teeth, substantially as and for the purpose specified.

14. In a steering device for vehicles, the combination of a driving member formed with a hollow portion having internal teeth, and an opening extending through the wall of said portion, a driven member movable in the opening and provided with teeth engaging the internal teeth, said driven member projecting beyond the opening, and means for closing the opening in the hollow portion of the driving member, said means being provided with an extension for inclosing the part of the driven member projecting beyond the opening of the driving member, substantially as and for the purpose specified.

15. In a steering device for vehicles, the combination of a driving member formed with a hollow portion having internal teeth, and an opening extending through the wall of said portion, a driven member provided with teeth engaging the internal teeth, and means for closing the opening in the driving member, said means having its inner portion provided with a bearing for the driven member, substantially as and for the purpose set forth

16. In a steering device for vehicles, the combination of a driving member formed with a hollow portion having internal teeth, and an opening extending through the wall of said portion, a driven member movable in the opening and provided with teeth engaging the internal teeth, said driven member projecting beyond the opening, and a casing for the driving member having a part for closing the opening in the driving member, said part having its inner portion provided with a bearing for the driven member and its outer portion formed with an extension for inclosing the portion of the driven member projecting beyond the opening of the driving member, substantially as and for the purpose described.

17. In a steering device for vehicles, the combination of a driving member formed with a hollow portion having internal teeth, and an opening in its lower part, and a casing for the driving member comprising a main part, and an end section for closing the opening in the hollow portion of the driving member, the casing and the driving member having means for journaling the driving member in the casing and preventing endwise movement thereof relatively to the casing, and said end section of the casing having its inner portion provided with a bearing and its outer portion formed with a hollow extension; with a driven member provided with teeth engaging the internal teeth, said driven member being journaled in the

bearing of the end section of the casing and projecting into said hollow extension, substantially as and for the purpose specified.

18. A steering device for vehicles, comprising a driving member having internal teeth, a driven member provided with teeth engaging the former teeth, a casing, and a power-transmitting member movable about the axis of the driven member with said driven member and projecting beyond the casing, substantially as and for the purpose set forth.

19. A steering device for vehicles, comprising a driving member having internal substantially helical teeth, a driven member provided with teeth engaging the former teeth, and a power-transmitting member movable about the axis of the driven member with said driven member, substantially as and for the purpose set forth.

20. A steering device for vehicles, comprising a driving member having internal substantially helical teeth, a driven member provided with teeth engaging the former teeth, a bearing for the driven member, and a power-transmitting member movable about the axis of the driven member and having an extension projecting beyond the bearing and fixed to the driven member, substantially as and for the purpose described.

21. In a steering device for vehicles, the combination of a driving member formed with a hollow portion having internal teeth, and an opening extending through the wall of said portion, means for closing the opening in the hollow portion of the driving member, said means having an opening therethrough, a driven member provided with teeth engaging the former teeth, and a power-transmitting member movable with the driven member in the opening in said means, substantially as and for the purpose specified.

22. In a steering device for vehicles, the combination of a driving member formed with a hollow portion having internal teeth, and an opening extending through the wall of said portion, means for closing the opening in the hollow portion of the driving member, said means having its inner portion provided with a bearing, a shaft supported by the bearing, a driven member supported by the shaft and movable in the opening and provided with teeth engaging the internal teeth, and a power-transmitting member mounted on the shaft and fixed to the driven member, substantially as and for the purpose set forth.

23. In a steering device for vehicles, the combination of a driving member formed with a hollow portion having internal teeth and an opening extending through the wall of said portion, a casing for the driving member having a part for closing the opening in the hollow portion of the driving member, said part having its inner portion provided with a bearing and its outer portion formed with a hollow extension, and said casing being formed with an opening at one side of the extension, a shaft supported by the bearing, a driven member supported by the shaft and movable in the hollow extension and provided with teeth engaging the internal teeth, and a power-transmitting member passed through the opening at one side of the hollow extension and mounted on the shaft and fixed to the driven member, substantially as and for the purpose described.

24. In combination, pivoted wheel-supports having arms extending rearwardly from their axes, one of the supports being provided with an arm projecting in front of the axes of said supports, a driving member having internal teeth, a driven member provided with teeth engaging the former teeth and a power-transmitting member connected to the forwardly-projecting arm and movable about the axis of the driven member with said driven member, substantially as and for the purpose specified.

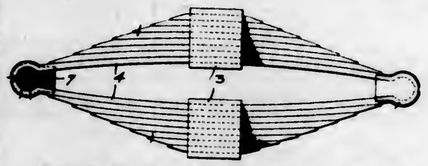
809,172. **BOUQUET-HOLDER.** JOHN BURNOK, Fort Shaw, Mont. Filed Apr. 19, 1905. Serial No. 256,267.

Claim.—1. A device of the class described comprising a hollow body portion including two sections hinged together at their lower ends for movement of their upper ends toward and away from each other, means for holding the sections yieldably with their upper ends separated, means for holding the sections with their adjacent edge portion in mutual engagement, absorbent linings for the sections, and flanges carried by the upper ends of the section and extending outwardly therefrom, said sections and their respective flanges being each formed from a single piece of metal, the body portion being open at its upper end.

2. A device of the class described comprising two transversely-semicircular sections rounded at their lower ends and open at their upper ends, a hinge secured to the rounded portions of the sections for movement of the sections into and out of engagement with each other, said sections being cut away to receive the hinge, means for holding the sections with their edge portions in mutual engagement, absorbent linings for the sections, an outwardly-extending flange carried by the upper end of each section, each of said sections and its flange being formed of a single piece of metal, and means for holding the sections yieldably with their edge portions in spaced relation.

3. A bouquet-holder comprising a body portion including two sections hinged together at their lower ends for movement into and out of operative position, said body portion being adapted for engagement in the neck of a vase, outwardly-extending flanges carried by the outer ends of the sections and arranged to rest upon the neck of a vase in which the body portion is engaged, means for holding the sections yieldably in inoperative position, a latch arranged to hold the sections in operative position, absorbent linings for the sections, and pins carried by the sections and extending thereinto for the engagement of plants disposed within the holder to retain said plants in position.

809,173. **SPRING END.** GEORGE H. CHANNELL, New Kensington, Pa., assignor to Union Spring and Manufacturing Co., New Kensington, Pa., a Corporation of Pennsylvania. Filed Mar. 13, 1905. Serial No. 249,857.



Claim.—1. A spring-end support comprising a block having a rounded body adapted to have the spring ends lapped over the same, and an inwardly-projecting bearing portion of less thickness than the body.

2. A spring-end support comprising a block having a rounded body adapted to have the spring ends lapped over the same, and an inwardly-projecting bearing portion of less thickness than the body and of increasing thickness inwardly.

3. A spring-end support comprising a block having a rounded body adapted to have the spring ends lapped over the same, an inwardly-projecting bearing portion of less thickness than the body, and an outwardly-projecting lug or rib adapted to lie between the ends of the springs.

4. A spring-end support comprising a block having a rounded body adapted to have the spring ends lapped over the same, an inwardly-projecting bearing portion of less thickness than the body, and end projections or flanges adapted to bear against the edges of the springs.

5. A spring-end support comprising a block having a body adapted to be embraced by the spring ends, and an inwardly-projecting bearing portion of less thickness than the body and of increasing thickness inwardly.

6. The combination of a leaf-spring comprising leaves substantially straight at their ends and having the longest leaf of each member provided at its ends with a concave portion extending transversely thereof, together with an end-support comprising a block having a rounded body seated in said concave portion and an inwardly-projecting bearing portion of less thickness than the body.

7. The combination of a leaf-spring comprising leaves substantially straight at their ends and having the longest leaf of each of its members provided at its ends with a concave portion extending transversely thereof, together with an end-support comprising a block having a rounded body seated in said concave portion and an inwardly-projecting bearing portion of less thickness than the body and of increasing thickness inwardly.

8. The combination of a leaf-spring comprising leaves substantially straight at their ends and having the longest leaf of each of its members provided at its ends with a depression extending transversely thereof, together with an end-support comprising a body seated in said depressions and provided with an inwardly-projecting bearing portion of less thickness than the body and of increasing thickness inwardly.

9. The combination with a leaf-spring comprising leaves substantially straight at their ends and having the longest leaf of each of these members provided at its ends with a depression extending transversely thereof, together with an end-support comprising a body seated in said depressions and provided with an inwardly-projecting bearing portion of less thickness than said body and of increasing thickness inwardly.

10. The combination of a leaf-spring comprising leaves substantially straight at their ends and having the longest leaf of each of its members provided at its ends with a depression extending transversely thereof, together with an end-support comprising a body seated in said depressions and having an inwardly-extending bearing portion and provided with flanges or projections adapted to bear against the edges of said spring-leaves.

809,174. **VIOLIN-BRIDGE.** THOMAS L. DAVIS, Speedwell, Tenn. Filed May 10, 1905. Serial No. 260,845.

Claim.—1. A bridge for musical instruments comprising a hollow body portion adapted for the reception of strings thereupon and a resonant body located within the body portion.

2. A bridge for musical instruments comprising a hollow body portion adapted for the reception of strings thereupon having openings in one of its walls and a resonant body located within the body portion.

3. A bridge for musical instruments comprising a hollow body portion adapted to receive strings thereupon, a transversely-extending pin secured at one end to one of the walls of the body portion and lying within the latter, and a resonant body disposed upon the pin, said wall of the body portion having a plurality of openings therein arranged in a series surrounding the pin.

4. A bridge for musical instruments comprising a hollow body portion adapted to receive strings thereupon, a pin located therewithin and secured to the body portion and a resonant body mounted upon the pin.

5. A bridge for musical instruments comprising a hollow body portion adapted to receive strings thereupon, a pin disposed within the body portion and secured at its ends to the walls thereof and a resonant body mounted upon the pin.

6. A bridge for musical instruments comprising a hollow body portion adapted to receive strings thereupon including two sections, a pin disposed within the body portion and secured at its ends to the sections.

7. A bridge for musical instruments comprising a hollow body portion having a string-receiving portion, and a resonant body located within the body portion.

8. As an article of manufacture a bridge for musical instruments comprising two hollowed sections open at one side, said sections being disposed with their open faces against each other and being secured together, a transversely-extending pin secured at its ends to the sections and a longitudinally-extending metallic plate located within the body portion and having an opening in which the pin is engaged, said plate being transversely curved.

9. A bridge for musical instruments comprising a hollow body portion having a string-receiving portion, a pin located within the body portion and secured at its ends to opposite points upon the walls thereof to receive vibrations therefrom, and a resonant body mounted upon the pin.

10. A bridge for musical instruments comprising a vibratory body portion and a resonant body connected with the body portion to receive vibrations therefrom.

11. A bridge for musical instruments comprising a body portion and a resonant body connected therewith, said body comprising a transversely-curved metallic plate.

12. A bridge for musical instruments comprising a hollow body portion, a resonant body located within the body portion and a support for the body.

13. A device of the class described comprising a hollow body portion having a string-receiving ridge at its top, supporting-feet carried by the body portion, a pin located within the body portion and a resonant plate mounted upon the pin.

14. A bridge for musical instruments comprising a body portion including two longitudinally-extending sections having outer faces meeting at an angle at their upper edges to form a string-receiving ridge, a transversely-extending pin secured at each end to one of the sections and lying within the body portion and a resonant body mounted upon the pin.

15. A bridge for musical instruments comprising a body portion including two hollow sections disposed with their hollow portions toward each other and having the edges of the hollow portions flat and in mutual contact, the outer faces of the sections being curved and meeting at one edge at an angle to form a string-receiving ridge at the top of the body, said ridge being curved outwardly from end to end of the body portion, a support within the body portion adapted to receive strings thereupon, and a metallic sounding-plate carried by the support, each section having a plurality of perforations therethrough communicating with the hollow thereof.

809,175. **MAP-CASE.** JOHN DAWSON and CHARLES O. ROSEN, Chicago, Ill. Filed Feb. 17, 1905. Serial No. 246,123.

Claim.—1. An individual map-case having a flat top, a flat front wall which slopes downwardly and outwardly and a flat bottom terminating some distance from the front wall, thereby leaving an opening immediately adjacent to the front wall, substantially as described.

2. The combination of a plurality of individual map-cases each containing a map, means for removably supporting said cases one above another, each of said cases having an opening for the passage of its contained map, and strips secured to the bottoms of the maps, and, when the maps are wound up, contacting with adjacent cases to conceal the spaces between them, substantially as described.

3. The combination of a plurality of individual map-cases each containing a map, means for supporting said cases one above another, said cases having adjacent to their front walls openings for the passage of the map, and the bottom of each case projecting forward beyond the top of the case immediately below it, and strips secured to the bottoms of the maps and adapted to close said openings, substantially as described.

4. The combination of a plurality of individual map-cases each containing a map, means for supporting them one above another, the bottom of each case projecting forward beyond the top of the case immediately below it and each case having a bottom opening for the passage of the map, and strips secured to the maps and adapted to contact with adjacent cases, substantially as described.

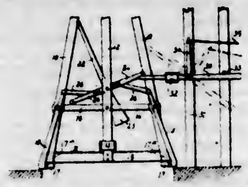
5. The combination of a plurality of individual map-cases and a cabinet for supporting them, each individual case and the end walls of the cabinet having means whereby the individual cases are independently supported, and each map having a strip adapted to contact with adjacent individual cases for closing the spaces between them, substantially as described.

6. The combination of a plurality of individual map-cases and a cabinet for supporting them, one above another, each individual case having at its ends projections and a cabinet having corresponding grooves for receiving said projections whereby the individual cases are independently supported, and strips attached to the bottoms of the individual maps and adapted to close the spaces between the individual cases, substantially as described.

7. The combination of a plurality of individual map-cases, each having at the bottom an opening for the passage of the map and each containing a map having at the bottom a strip, a cabinet, the cases and the cabinet being provided with interengaging elements whereby the cases are independently and removably supported by the cabinet, and means for holding the cases in place in the cabinet, said means including headed studs projecting from the cabinet and a strip having keyhole-slots for receiving the studs, substantially as described.

809,176. **LANDING-CHAIR FOR MINING-CAGES.** GILBERT H. DENTON, Denver, Colo. Filed Feb. 24, 1905. Serial No. 247,114.

Claim.—1. A cage, and chairs pivotally appended to said cage, above the platform thereof and having horizontal portions below their pivots with seats disposed beneath said platform of the cage.



2. A cage, and chairs pivotally appended to said cage with horizontal portions below their pivots, the point of pivot being above the platform thereof and a manually-operable lever pivotally connected with said chairs above their pivots.

3. A cage, and chairs having right-angled arms provided with seats below their pivots and with elongated eyes at their pivotal support, appended to said cage above the platform thereof by means of axial pins extending through said elongated eyes.

4. A cage, chairs pivotally attached to said cage above the platform thereof, and manually-operable means above the pivots of the chairs for placing said chairs in an operative position.

5. A cage, and chairs pivoted to the cage above the platform appending the chairs below the said platform, and manually-operable means above the pivots of the chairs for actuating the same adapted to place the chairs in an operative position.

6. A cage, chairs having central raised parts forming seats and having right-angled arms provided with elongated eyes by means of which the chairs are pivotally appended to the said cage at a point above the platform thereof, and means for placing said chairs in the operative position.

7. A cage, chairs pivotally connected thereto, and having horizontal portions with seats, means for actuating said chairs comprising a lever fulcrumed to said cage, arms extending from said lever, and connecting-bars pivoted to said arms and to said chairs.

8. A cage, chairs for said cage pivoted thereto, above the platform thereof, means above the pivots of said chairs for placing said chairs in an operative position comprising the lever fulcrumed to the said cage and toggle-arms pivoted to said lever and to the said chairs, and a lever secured to a substantial support adjacent to the passageway for the cage.

9. A cage, chairs pivotally appended to said cage from a point above the platform thereof, said chairs having raised central parts adapted to form seats for the cage and portions to rest upon substantial parts of the landings; also having right-angled arms provided with elongated apertures forming means for pivoting said chairs to the cage, and means for placing said chairs in an operative position comprising a lever fulcrumed to a central upright post of the cage, arms extending at substantially right angles from said lever, a downwardly-appended weight forming part of said lever, connecting-rods pivoted to said arms and to the upper ends of the right-angled arms of the chairs, substantially as specified.

10. A cage, and chairs pivotally appended to the cage above and independent of the platform thereof and having portions forming seats therefor.

11. A cage, and chairs pivotally appended to said cage above and independent of the platform thereof and having seats below the platform.

12. A cage, and chairs having the central parts of the main portions raised forming seats and having right-angled arms provided with elongated eyes; the said chairs adapted to be appended to the cage above the platform thereof by means of axial pins extending through the elongated eyes in the said right-angled arms in a manner adapted to bring the seats below the platform of the cage, and means for placing the chairs in an operative position.

13. A cage, and chairs pivotally appended to said cage above the platform and having manually-operable means extended above their pivots and connected with said chairs by means pivotally attached directly thereto for coöperation with actuating means therefor.

14. A cage, and chairs pivotally appended to said cage, the point of pivot being above the platform thereof integral portions of said chairs having seats below the platform.

15. A cage, and chairs having horizontal portions below the platform of the cage and right-angled arms extending upwardly therefrom, and said horizontal portions formed with seats appended below the platform of the cage, the said right-angled arms being pivotally attached to the posts of the cage above the platform thereof.

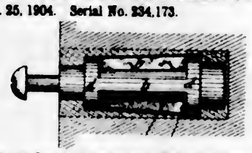
16. The combination of a cage, and bars having right-angled portions extended upwardly therefrom and having loose play on pivots on the cage above and independent of the platform of the cage, the horizontal portions of said bars being extended beneath the said platform.

17. The combination of a cage and bars having right-angled arms extended upwardly therefrom and horizontal portions extended beneath the platform of the cage and their upwardly-extended portions having loose play on pivots on the cage above the said platform, the central parts of said bars being raised.

18. The combination with a cage, of supporting devices disposed below the platform of the cage and having upwardly-extending arms, the latter being pivoted above the platform of the cage and having means pivotally connecting said arms beyond the pivot for coöperation with actuating means.

19. The combination with a cage, of supporting devices disposed below the platform of the cage and having upwardly-extending arms, the latter being pivoted above the platform of the cage and having means beyond the pivot for coöperation with manually-operable actuating means and means engaging means movable with said actuating means for automatically actuating said arms.

809,177. **DOWEL.** PAUL L. E. DROLSHAGEN, New York, N. Y. Filed Nov. 25, 1904. Serial No. 234,173.

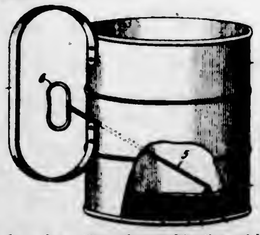


Claim.—1. A dowel of substantially circular cross-section provided with transversely-extending ribs, and with ribs extending between the same.

2. A dowel comprising a conically-tapering body having a socket in the smaller end thereof.

3. A dowel comprising a conically-tapering body provided in proximity to each end with a transverse circumferential rib, and having longitudinally-disposed ribs connecting said transverse ribs.

809,178. **FLOUR-SIFTER.** EDWIN T. FARMER, Carthage, Mo., assignor of one-half to John Ruhl, Carthage, Mo. Filed Apr. 11, 1905. Serial No. 254,913.



Claim.—In a flour-sifter, the combination with a cylindrical-shaped containing vessel provided with a screen-bottom, an agitator pivotally mounted thereon, a spring-arm subtended across the agitator and arranged to lie close to the same, one end of the arm being connected to the side of the vessel and its opposite end to the circumferential edge of the agitator, and a rod connected to the spring-arm near its point of connection with the agitator and extending upward therefrom and through the side of the vessel in close proximity to the handle thereof, whereby the agitator may be operated, substantially as set forth.

809,179. **RIDING-SADDLE.** PATRICK H. FONTAINE, Bethel Hill, N. C. Filed Nov. 18, 1904. Serial No. 233,277.

Claim.—1. The combination with a saddle having a loop, and a girth, of an attachment connected to the girth and having a loop slidably mounted within the loop of the saddle, and a stirrup-strap connected to one end of and supported by the loop of the attachment.

2. The combination with a saddle having a loop extending therefrom, and a girth, of an attachment connected to the girth and having a loop engaging and slidably mounted within the loop of the saddle, a stirrup-strap connected to and supported by the end of the loop of the attachment, and means for holding said strap in position at the end of the loop.

3. The combination with a saddle having a loop extending therefrom and a girth supported upon the saddle, of a stirrup-strap, a strap connected to the girth and having a loop engaging and slidably mounted upon the loop of the saddle, a keeper within the loop of the strap and a link interposed between said keeper and the end of its loop, said link engaging the stirrup-strap.

4. An attachment of the character described, comprising a girth-strap having a loop at one end, a keeper positioned within the limit of the edges of said strap and within the looped portion, and a link mounted within one end of the looped portion of said strap.

5. An attachment for saddles, comprising a strap provided with a looped portion at one end thereof, a keeper secured within the looped portion, and stirrup-supporting means assembled with the looped portion of said strap and normally engaging the keeper within the same.

6. The combination with a saddle provided with a depending member, and a girth, of an adjustable member provided with a loop portion positioned upon said depending member and connected to said girth, and looped means positioned within the looped portion of said adjustable member and being capable of movement for causing adjustment of said adjustable member.

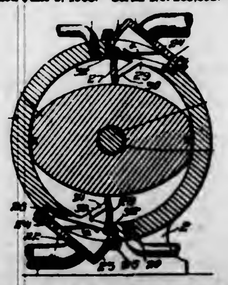
7. The combination with a saddle, and a girth, of an adjustable member supported by said saddle and connected to said girth, said member provided with means for limiting the girth against downward movement, and a stirrup supported by the upper end of said member.

8. The combination with a saddle provided with a depending member, and a girth, of a slidable strap supported upon said depending member and connected at its lower end to said girth, and a stirrup-strap secured to the upper end of said slidable strap and capable of moving said strap upon the depending portion of the saddle for adjusting said girth.

9. The combination with a saddle, and a girth, of an adjustable member carried by said saddle and connected to said girth, said member provided with a loop formed upon its upper end, a stirrup-strap provided with looped means carried by said member, the looped means of said stirrup-strap engaging the looped means of said member.

10. The combination with a saddle, and a girth, of an adjustable member positioned upon said saddle and connected to said girth, a keeper, said member inclosing said keeper, and stirrup-supporting means positioned upon said member and capable of engaging said keeper, said stirrup-supporting means being capable of causing adjustment of said member and girth.

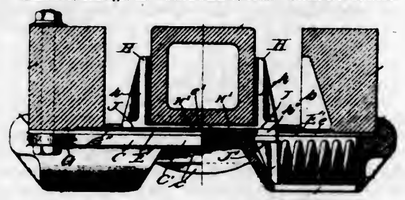
809,180. **ROTARY ENGINE.** HENNING A. FREDLUND, Dubuc, Canada. Filed June 5, 1905. Serial No. 263,866.



Claim.—1. A rotary engine including a casing having oppositely-disposed housings secured upon the outer periphery thereof, exhaust-openings leading through the casing and the housings, gates pivotally mounted for movement into corresponding housings and the casing, a piston arranged within the casing upon which the said gates normally rest, the said gates being arranged in the line of the exhaust-openings, and inlet-ports for the admission of steam for the rotation of the piston and to move the gates into and out of their respective housings.

2. A rotary engine comprising a casing, a piston mounted within the casing, the piston having end flanges and an intermediate flange arranged nearer one end flange than the other, the portions of the piston between said flanges being oval-shaped, exhaust-ports in the casing, a gate pivotally mounted within the line of each exhaust-opening, housings arranged for the reception of each gate when moved into one position, and intermediate ports for the reception of steam to rotate the piston and for moving the gates into and out of their respective housings.

809,181. **CENTERING DEVICE FOR DRAW-BARS.** MYERS A. GARRETT, Chicago, Ill. Filed June 7, 1905. Serial No. 264,129.



Claim.—1. In a device of the class described, the combination of a laterally-movable follower adapted to engage the draw-bar, laterally-disposed curved guides engaging the follower, a spring adapted to exert lateral pressure upon the follower, and means for supporting the follower and spring, substantially as described.

2. In a device of the class described the combination of a follower adapted to engage the draw-bar, a support having ribs upon which the follower rests and having laterally-disposed guides engaging the follower, a spring for exerting lateral pressure upon the follower, and means for supporting the spring, substantially as described.

3. In a device of the class described, the combination of a follower adapted to engage the draw-bar, a support for the follower having a raised rib, adapted to directly engage and support the draw-bar, a spring for exerting lateral pressure upon the follower, and a support for the spring, substantially as described.

4. In a device of the class described the combination of a follower adapted to engage the draw-bar, a support having ribs upon which the follower rests and having a higher rib adapted to engage and support the draw-bar, a spring for exerting lateral pressure upon the follower, and means for supporting the spring, substantially as described.

5. In a device of the class described, the combination of a laterally-movable follower, a support therefor, a spring and means for supporting the spring, said follower having a head adapted to engage the draw-bar, and a foot adapted to engage the spring, and said support having a slot through which the follower extends substantially as described.

6. In a device of the class described, the combination of a laterally-movable follower, a support therefor, a spring, and means for supporting the spring, said follower having a head adapted to engage the draw-bar and a foot adapted to engage the spriag, and said support having a curved slot through which the follower extends, substantially as described.

7. In a device of the class described, the combination of a support, a follower extending above and below the support, a spring adapted to engage the follower below the support, and means for supporting the spring, the support having a laterally-disposed curved guide for the follower, substantially as described.

8. In a device of the class described, the combination of a support in the nature of a carry-iron, a pair of independent followers supported by and extending above and below the support, a spring adapted to engage the follower below the support and a casing containing the spring, substantially as described.

9. In a device of the class described, the combination of a laterally-movable follower, a spring for exerting lateral pressure upon the follower, a chamber containing the spring and open at top and a slotted plate forming a partial cover for the casing and a support for the follower, substantially as described.

10. In a device of the class described the combination of a pair of independently-movable followers adapted to engage the draw-bar, means for supporting said followers and confining them to lateral curvilinear movement, independent springs for exerting lateral pressure upon the followers, and means for supporting the springs, substantially as described.

11. In a device of the class described the combination of a pair of independently-movable followers, independent springs for exerting lateral pressure upon the followers, and means for supporting the followers and springs, said supporting means including a plate having vertical shoulders adapted to engage the draft-arms, substantially as described.

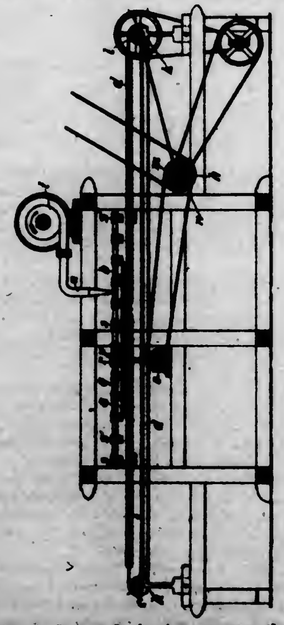
12. In a device of the class described the combination of a pair of independently-movable followers, springs for exerting lateral pressure upon the followers and means for supporting the followers and springs, said supporting means including a plate having beneath it chambers for containing the springs, substantially as described.

13. In a device of the class described, the combination of a pair of independent laterally-movable followers having vertical faces adapted to engage the opposite sides of the draw-bar, each of said followers having a horizontal toe adapted to extend beneath and support the draw-bar, and a spring adapted to exert lateral pressure upon the follower, substantially as described.

14. In a device of the class described, the combination of a laterally-movable follower adapted to engage the draw-bar, said follower having a toe adapted to extend beneath and support the draw-bar, a support upon which the follower is slidably mounted and upon which the toe bears, whereby it is supported and in turn supports the draw-bar, means for confining the follower to lateral movement, and means for yieldingly resisting the movement of the follower, substantially as described.

15. In a device of the class described, the combination of a pair of independently-movable followers adapted to engage the draw-bar, said followers having toes adapted to extend beneath and support the draw-bar, a support upon which the followers are slidably mounted and upon which the toes bear, means for confining the followers to lateral movement, and means for yieldingly resisting their outward movement, substantially as described.

809,182. DUSTING-MACHINE FOR CANDY. PAUL HAASE, Pinneck, Germany. Filed Jan. 24, 1905. Serial No. 242,573.



Claim.—1. In a candy-cleaning apparatus, the combination of an endless traveling apron, means for shaking the apron in its course of travel, a candy-receptacle carried by the apron, brushes for cleaning the candy as the receptacle travels and reciprocates with the apron, means for operating the brushes, and means for discharging the dust and removed impurities from the receptacle.

2. In a candy-cleaning apparatus, the combination of a continuously-traveling shaking-apron, a receptacle carried thereby and lined with brushes, movable brushes coöperating with the brushes in the receptacle to remove the dust and impurities from the candy therein, means for discharging the removed dust and impurities from the receptacle.

3. In a candy-cleaning apparatus, the combination of a continuously-traveling shaking-apron, a receptacle carried thereby, brushes for cleaning the candy in the receptacle in its course of travel with the apron, means for operating the apron and brushes, and means for delivering a blast of air against the candy in the receptacle to discharge the removed dust and impurities therefrom.

4. In a candy-cleaning apparatus, the combination of a continuously-traveling shaking-apron, a candy-receptacle carried thereby, brushes pivoted to swing downward into the receptacle and remove the dust and impurities from the candy contained therein, eccentrics for operating said brushes, means for actuating the apron and eccentrics, and means for discharging the removed dust and impurities from the receptacle.

5. In a candy-cleaning apparatus, the combination of resilient supports provided with bearings, shafts journaled in said bearings, an endless apron traveling around said shafts, means for vibrating the supports in unison during the course of travel of the apron, a candy-receptacle carried by the apron, brushes for cleaning the candy therein, means for operating the brushes, and means for discharging the dust and impurities from the receptacle.

6. In a candy-cleaning apparatus, an endless traveling shaking-apron, a receptacle carried thereby provided with fixed cleaning-brushes, movable brushes coöperating therewith, means for operating the apron and movable brushes, and means for discharging the dust and impurities from the receptacle.

809,183. CURRENT-TAP. WILLIAM D. HARRIS, Philadelphia, Pa. Filed Mar. 24, 1905. Serial No. 251,836.

Claim.—1. In a current-tap, the combination with a body of insulating material of a set of plug-contacts and a second set of socket-contacts, and terminals for the attachment of conducting-wires in electrical connection with certain of said contacts, there being a single metallic shell having a portion serving as one of the plug-contacts and another portion serving as one of the socket-contacts, substantially as described.

2. In a current-tap, the combination with a body of insulating material of a set of plug-contacts and a second set of socket-contacts, and terminals for the attachment of conducting-wires in electrical connection with certain of said contacts, there being a single metallic shell having a portion serving as one of the plug-contacts and another portion serving as one of the socket-contacts, with an insulating-casing extending around the terminals and a portion of the shell, substantially as described.

3. In a current-tap, the combination of a supporting-body of non-conducting material, a shell upon and projecting beyond the same, said projecting portion of the shell being constructed to receive a lamp and another portion of the shell being constructed to enter a socket, electrically-connected contacts on opposite ends of said body, and two terminals for the attachment of current-conductors, one of said terminals being electrically connected to the conductors on the ends of the body and the other being electrically connected to the metallic shell, substantially as described.

4. The combination in a current-tap of a body of non-conducting material, a metallic shell carried thereby having two portions, of which one is formed to enter a socket and the other is formed to receive a lamp, two contacts in electrical connection with each other and respectively carried on opposite ends of the porcelain body, one of said contacts having a portion extending adjacent to an opening in the shell and being provided with a binding screw or screws, with a second binding screw or screws in electrical connection with said shell, substantially as described.

5. The combination in a current-tap of a body of non-conducting material, a metallic shell carried thereby having two portions, of which one is formed to enter a socket and the other is formed to receive a lamp, two contacts in electrical connection with each other and respectively carried on opposite ends of the porcelain body, one of said contacts having a portion extending adjacent to an opening in the shell and being provided with a terminal screw or screws, a second terminal screw or screws in electrical connection with the shell, and a casing surrounding a portion of said shell and provided with openings placed to permit of access to said terminal screws, substantially as described.

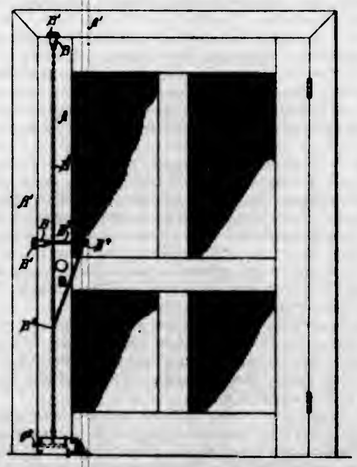
6. The combination of a porcelain body, contact-pieces on opposite ends of the same, means for electrically connecting said pieces, a metallic shell carried on the body electrically insulated from said contacts and having one portion constructed to enter a socket and another portion constructed to receive a lamp, means for preventing motion of the said shell and said body relatively to each other, with terminals for the connection of conductors respectively connected to the shell and to the contact-pieces, substantially as described.

7. The combination of a supporting-body, a metallic shell thereon having a portion for the reception of a lamp and another portion shaped to enter a lamp-socket, a piece carried in a recess of said body, a screw passing through the shell and entering said piece, electrically-connected contacts on opposite ends of the body, and conductor-terminals respectively connected to said contacts and to the shell, substantially as described.

8. The combination of a body of non-conducting material, contacts on opposite ends of the same, a screw passing through the body and electrically and mechanically connected to said contacts, one of the contacts having an extension, a shell carried by the body and having a portion projecting beyond one end of the same for the reception of a lamp and another portion constructed to enter a lamp-socket, with terminals respectively connected to said extension of one of the contacts and to the metallic shell, substantially as described.

9. The combination of a body of non-conducting material, conducting-pieces on opposite ends of the same, a screw passing through the body and electrically and mechanically connecting said pieces, one of the pieces having an extension, a shell carried by the body having a portion projecting beyond one end of the same for the reception of a lamp, and another portion constructed to enter a lamp-socket, terminals respectively connected to said extension of one of the contact-pieces and to the metallic shell, and a casing of non-conducting material surrounding the open end of the metallic shell, substantially as described.

809,184. MULTIPLE-BOLT MECHANISM. SYLVESTER S. HAWLEY, Centralia, Ill. Filed Apr. 5, 1905. Serial No. 253,942.

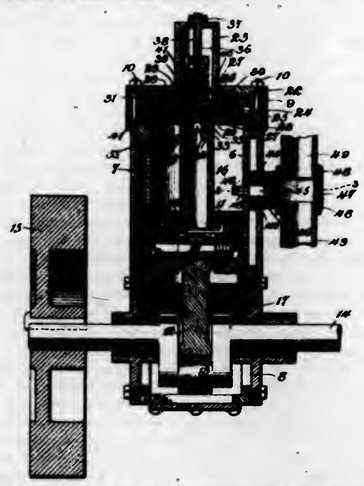


Claim.—1. In a device of the class described, a pivoted angular operating-bolt provided with a lever at one side thereof, a locking-bolt removed from said operating-bolt, a rod extending from said lever, a connection extending from the locking-bolt to the rod upon the lever of the pivoted bolt, a fixed plate, and a pivoted latch-plate carried by the lever end of the operating-bolt to engage said fixed plate.

2. In a device of the class described, an angular operating-bolt pivoted intermediate of its ends, a casing within which said bolt is disposed, a post disposed upon said bolt at one side of its pivot, a spring surrounding said post and bearing upon said casing and bolt, and a pivoted latch member mounted upon the free end of the lever portion of the bolt to engage a fixed plate.

3. In a device of the class described, an angular operating-bolt pivoted intermediate of its ends, a casing within which said bolt is disposed, a post disposed upon said bolt at one side of its pivot, a spring surrounding said post and bearing upon said casing and bolt, a pivoted latch member mounted upon the free end of the lever portion of the bolt to engage a fixed plate, a connecting-rod extending from the lever end of said bolt through said casing, a bolt disposed at a distance therefrom, and a flexible connection between said rod and locking-bolt.

809,185. EXPLOSIVE-ENGINE. JOHN F. JOHNSON, Chester, Pa. Filed Oct. 19, 1904. Serial No. 229,133.



Claim.—1. In an engine, the combination with a cylinder, of a reciprocatory piston mounted therein, a tubular extension carried by the piston and reciprocating therewith, said extension having a port, means for introducing motive-fluid-supply charges into the extension, a cut-off located within the extension and arranged to close the port thereof, and means for holding the cut-off against reciprocation.

2. In an engine, the combination with a cylinder and compression-chamber, of a piston operating between the same, a tubular extension carried by the piston, said extension projecting into the cylinder, having communication with the chamber and having a port, and a cut-off located in the extension and held against reciprocation therewith, said cut-off being arranged to close the port thereof.

3. In an engine, the combination with a cylinder having a rear wall, of a reciprocatory piston mounted in the cylinder, a tubular motive-fluid inlet extension carried by the piston and having a port contiguous to its rear end, said port being spaced from the rear wall of the cylinder when the piston is at the forward limit of its stroke, and a stationary cut-off plunger located in the extension, said plunger coacting with the port to close the same upon the rearward movement of the piston.

4. In an engine, the combination with a cylinder, of a piston operating therein and having a tubular extension, said extension being provided with ports located at different distances from the piston, and means for simultaneously opening and closing the ports on the reciprocation of the piston.

5. In an engine, the combination with a cylinder, of a piston operating therein and having a tubular extension, said extension being provided in different sides with ports located at different distances from the piston, and means located within the extension for simultaneously opening and closing the ports upon the reciprocation of the piston.

10. In a device of the class described the combination of a pair of independently-movable followers adapted to engage the draw-bar, means for supporting said followers and confining them to lateral curvilinear movement, independent springs for exerting lateral pressure upon the followers, and means for supporting the springs, substantially as described.

11. In a device of the class described the combination of a pair of independently-movable followers, independent springs for exerting lateral pressure upon the followers, and means for supporting the followers and springs, said supporting means including a plate having vertical shoulders adapted to engage the draft-arms, substantially as described.

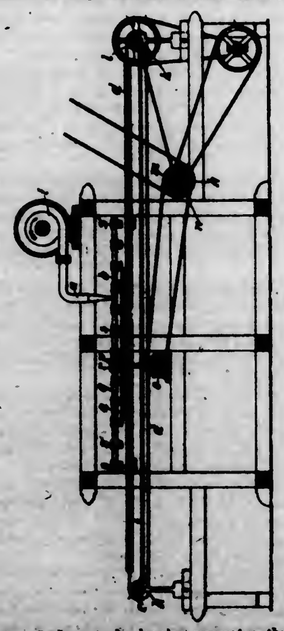
12. In a device of the class described the combination of a pair of independently-movable followers, springs for exerting lateral pressure upon the followers and means for supporting the followers and springs, said supporting means including a plate having beneath it chambers for containing the springs, substantially as described.

13. In a device of the class described, the combination of a pair of independent laterally-movable followers having vertical faces adapted to engage the opposite sides of the draw-bar, each of said followers having a horizontal toe adapted to extend beneath and support the draw-bar, and a spring adapted to exert lateral pressure upon the follower, substantially as described.

14. In a device of the class described, the combination of a laterally-movable follower adapted to engage the draw-bar, said follower having a toe adapted to extend beneath and support the draw-bar, a support upon which the follower is slidably mounted and upon which the toe bears, whereby it is supported and in turn supports the draw-bar, means for confining the follower to lateral movement, and means for yieldingly resisting the movement of the follower, substantially as described.

15. In a device of the class described, the combination of a pair of independently-movable followers adapted to engage the draw-bar, said followers having toes adapted to extend beneath and support the draw-bar, a support upon which the followers are slidably mounted and upon which the toes bear, means for confining the followers to lateral movement, and means for yieldingly resisting their outward movement, substantially as described.

809,182. **DUSTING-MACHINE FOR CANDY.** PAUL HAASE, Pfunsek, Germany. Filed Jan. 24, 1905. Serial No. 242,573.



Claim.—1. In a candy-cleaning apparatus, the combination of an endless traveling apron, means for shaking the apron in its course of travel, a candy-receptacle carried by the apron, brushes for cleaning the candy as the receptacle travels and reciprocates with the apron, means for operating the brushes, and means for discharging the dust and removed impurities from the receptacle.

2. In a candy-cleaning apparatus, the combination of a continuously-traveling shaking-apron, a receptacle carried thereby and lined with brushes, movable brushes coöperating with the brushes in the receptacle to remove the dust and impurities from the candy therein, means for discharging the removed dust and impurities from the receptacle.

3. In a candy-cleaning apparatus, the combination of a continuously-traveling shaking-apron, a receptacle carried thereby, brushes for cleaning the candy in the receptacle in its course of travel with the apron, means for operating the apron and brushes, and means for delivering a blast of air against the candy in the receptacle to discharge the removed dust and impurities therefrom.

4. In a candy-cleaning apparatus, the combination of a continuously-traveling shaking-apron, a candy-receptacle carried thereby, brushes pivoted to swing downward into the receptacle and remove the dust and impurities from the candy contained therein, eccentrics for operating said brushes, means for actuating the apron and eccentrics, and means for discharging the removed dust and impurities from the receptacle.

5. In a candy-cleaning apparatus, the combination of resilient supports provided with bearings, shafts journaled in said bearings, an endless apron traveling around said shafts, means for vibrating the supports in unison during the course of travel of the apron, a candy-receptacle carried by the apron, brushes for cleaning the candy therein, means for operating the brushes, and means for discharging the dust and impurities from the receptacle.

6. In a candy-cleaning apparatus, an endless traveling shaking-apron, a receptacle carried thereby provided with fixed cleaning-brushes, movable brushes coöperating therewith, means for operating the apron and movable brushes, and means for discharging the dust and impurities from the receptacle.

809,183. **CURRENT-TAP.** WILLIAM D. HARRIS, Philadelphia, Pa. Filed Mar. 24, 1905. Serial No. 251,836.

Claim.—1. In a current-tap, the combination with a body of insulating material of a set of plug-contacts and a second set of socket-contacts, and terminals for the attachment of conducting-wires in electrical connection with certain of said contacts, there being a single metallic shell having a portion serving as one of the plug-contacts and another portion serving as one of the socket-contacts, substantially as described.

2. In a current-tap, the combination with a body of insulating material of a set of plug-contacts and a second set of socket-contacts, and terminals for the attachment of conducting-wires in electrical connection with certain of said contacts, there being a single metallic shell having a portion serving as one of the plug-contacts and another portion serving as one of the socket-contacts, with an insulating-casing extending around the terminals and a portion of the shell, substantially as described.

3. In a current-tap, the combination of a supporting-body of non-conducting material, a shell upon and projecting beyond the same, said projecting portion of the shell being constructed to receive a lamp and another portion of the shell being constructed to enter a socket, electrically-connected contacts on opposite ends of said body, and two terminals for the attachment of current-conductors, one of said terminals being electrically connected to the conductors on the ends of the body and the other being electrically connected to the metallic shell, substantially as described.

4. The combination in a current-tap of a body of non-conducting material, a metallic shell carried thereby having two portions, of which one is formed to enter a socket and the other is formed to receive a lamp, two contacts in electrical connection with each other and respectively carried on opposite ends of the porcelain body, one of said contacts having a portion extending adjacent to an opening in the shell and being provided with a binding screw or screws, with a second binding screw or screws in electrical connection with said shell, substantially as described.

5. The combination in a current-tap of a body of non-conducting material, a metallic shell carried thereby having two portions, of which one is formed to enter a socket and the other is formed to receive a lamp, two contacts in electrical connection with each other and respectively carried on opposite ends of the porcelain body, one of said contacts having a portion extending adjacent to an opening in the shell and being provided with a terminal screw or screws, a second terminal screw or screws in electrical connection with the shell, and a casing surrounding a portion of said shell and provided with openings placed to permit of access to said terminal screws, substantially as described.

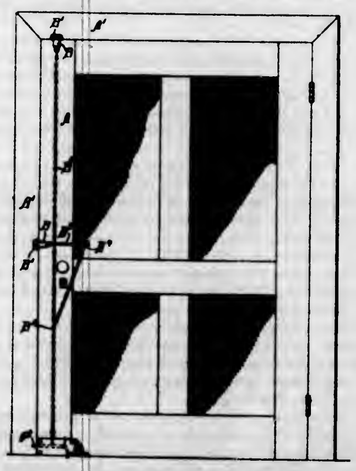
6. The combination of a porcelain body, contact-pieces on opposite ends of the same, means for electrically connecting said pieces, a metallic shell carried on the body electrically insulated from said contacts and having one portion constructed to enter a socket and another portion constructed to receive a lamp, means for preventing motion of the said shell and said body relatively to each other, with terminals for the connection of conductors respectively connected to the shell and to the contact-pieces, substantially as described.

7. The combination of a supporting-body, a metallic shell thereon having a portion for the reception of a lamp and another portion shaped to enter a lamp-socket, a piece carried in a recess of said body, a screw passing through the shell and entering said piece, electrically-connected contacts on opposite ends of the body, and conductor-terminals respectively connected to said contacts and to the shell, substantially as described.

8. The combination of a body of non-conducting material, contacts on opposite ends of the same, a screw passing through the body and electrically and mechanically connected to said contacts, one of the contacts having an extension, a shell carried by the body and having a portion projecting beyond one end of the same for the reception of a lamp and another portion constructed to enter a lamp-socket, with terminals respectively connected to said extension of one of the contacts and to the metallic shell, substantially as described.

9. The combination of a body of non-conducting material, conducting-pieces on opposite ends of the same, a screw passing through the body and electrically and mechanically connecting said pieces, one of the pieces having an extension, a shell carried by the body having a portion projecting beyond one end of the same for the reception of a lamp, and another portion constructed to enter a lamp-socket, terminals respectively connected to said extension of one of the contact-pieces and to the metallic shell, and a casing of non-conducting material surrounding the open end of the metallic shell, substantially as described.

809,184. **MULTIPLE-BOLT MECHANISM.** SYLVESTER S. HAWLEY, Centralia, Ill. Filed Apr. 5, 1905. Serial No. 253,943.

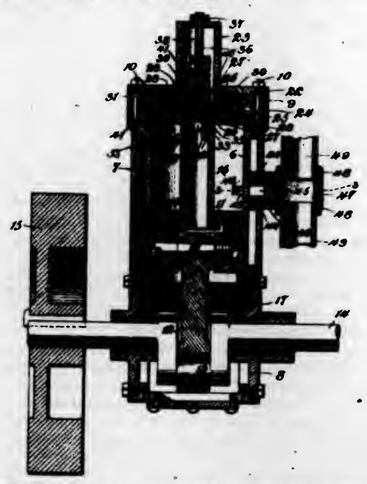


Claim.—1. In a device of the class described, a pivoted angular operating-bolt provided with a lever at one side thereof, a locking-bolt removed from said operating-bolt, a rod extending from said lever, a connection extending from the locking-bolt to the rod upon the lever of the pivoted bolt, a fixed plate, and a pivoted latch-plate carried by the lever end of the operating-bolt to engage said fixed plate.

2. In a device of the class described, an angular operating-bolt pivoted intermediate of its ends, a casing within which said bolt is disposed, a post disposed upon said bolt at one side of its pivot, a spring surrounding said post and bearing upon said casing and bolt, and a pivoted latch member mounted upon the free end of the lever portion of the bolt to engage a fixed plate.

3. In a device of the class described, an angular operating-bolt pivoted intermediate of its ends, a casing within which said bolt is disposed, a post disposed upon said bolt at one side of its pivot, a spring surrounding said post and bearing upon said casing and bolt, a pivoted latch member mounted upon the free end of the lever portion of the bolt to engage a fixed plate, a connecting-rod extending from the lever end of said bolt through said casing, a bolt disposed at a distance therefrom, and a flexible connection between said rod and locking-bolt.

809,185. **EXPLOSIVE-ENGINE.** JOHN F. JOHNSON, Chester, Pa. Filed Oct. 19, 1904. Serial No. 229,133.



Claim.—1. In an engine, the combination with a cylinder, of a reciprocatory piston mounted therein, a tubular extension carried by the piston and reciprocating therewith, said extension having a port, means for introducing motive-fluid-supply charges into the extension, a cut-off located within the extension and arranged to close the port thereof, and means for holding the cut-off against reciprocation.

2. In an engine, the combination with a cylinder and compression-chamber, of a piston operating between the same, a tubular extension carried by the piston, said extension projecting into the cylinder, having communication with the chamber and having a port, and a cut-off located in the extension and held against reciprocation therewith, said cut-off being arranged to close the port thereof.

3. In an engine, the combination with a cylinder having a rear wall, of a reciprocatory piston mounted in the cylinder, a tubular motive-fluid inlet extension carried by the piston and having a port contiguous to its rear end, said port being spaced from the rear wall of the cylinder when the piston is at the forward limit of its stroke, and a stationary cut-off plunger located in the extension, said plunger coacting with the port to close the same upon the rearward movement of the piston.

4. In an engine, the combination with a cylinder, of a piston operating therein and having a tubular extension, said extension being provided with ports located at different distances from the piston, and means for simultaneously opening and closing the ports on the reciprocation of the piston.

5. In an engine, the combination with a cylinder, of a piston operating therein and having a tubular extension, said extension being provided in different sides with ports located at different distances from the piston, and means located within the extension for simultaneously opening and closing the ports upon the reciprocation of the piston.

6. In an engine, the combination with a cylinder, of a piston operating therein and having a tubular extension, said extension being provided in different sides with ports located at different distances from the piston, and a stationary plunger located within the extension and having spaced projections that are arranged to cover certain of the ports, other of said ports being movable to points between the projections.

7. In an engine, the combination with a cylinder having a rear wall provided with a socket, of a piston operating in the cylinder and having a tubular extension movable into and out of the socket, said extension having a port movable into and out of the cylinder, a stationary plunger located within the extension, and packing interposed between the plunger and extension and between the rear wall and the extension.

8. In an engine, the combination with a cylinder having a rear wall provided with a socket, of a piston operating in the cylinder and having a tubular extension movable into and out of the socket, said extension having a port movable into and out of the cylinder, a stationary plunger located within the extension, and a packing-ring located in the rear wall of the cylinder and surrounding the extension, said plunger being also provided with packing-receiving recesses.

9. In an engine, the combination with a cylinder, of a piston operating therein and having a tubular extension provided with ports, a stationary cut-off plunger located within the extension and having an annular packing-recess, and a supporting-rod for the plunger having a passage-way communicating with the annular recess.

10. In an engine, the combination with a cylinder having a compression-chamber at one end, of a piston operating in the cylinder, a tubular extension carried by the piston and having communication with the compression-chamber, said extension being provided with lateral ports located at different distances from the piston, a cut-off plunger located within the extension and having an annular packing-groove, a supporting-rod for holding the plunger against movement with the extension, said rod having a passage-way communicating with the annular groove, and extensions carried by the inner end of the plunger for effecting the closure of certain of the ports.

11. In an engine, the combination with cylinders arranged in tandem, of pistons operating in the cylinders, a connection between the pistons, and means for introducing motive-fluid-supply charges to one of the cylinders through said connection.

12. In an engine, the combination with cylinders arranged in tandem, of pistons operating in the cylinders, a connection between the pistons, and means for successively introducing motive-fluid-supply charges to the cylinders through the said connection.

13. In an engine, the combination with separate sets of cylinders and compression-chambers, of a piston operating in each cylinder and acting upon the motive fluid in each chamber, a tubular connection between the pistons constituting means of communication between each chamber and the coacting cylinder, and means for cutting off said communication.

14. In an engine, the combination with cylinders arranged in tandem, of a compression-chamber formed at the end of the cylinders, pistons operating in each cylinder, a tubular connection between the pistons constituting means of communication between each chamber and its coacting cylinder, and means for cutting off such communication.

15. In an engine, the combination with cylinders disposed in tandem, of pistons operating in the cylinders and subdividing each into an explosion and a compression chamber, a tubular connection between the pistons having communication with both explosion and both compression chambers, and means for cutting off such communication.

16. In an engine, the combination with cylinders located in tandem, of pistons operating in the cylinders and subdividing each into an explosion and a compression chamber, a tubular connection between the pistons having communication with both compression-chambers and ports that open into both explosion-chambers, and means for cutting off the ports.

17. In an engine, the combination with cylinders arranged in tandem, of pistons operating in the cylinders and subdividing each into an inner explosion and an outer compression chamber, and a tubular extension connecting the pistons and having open ends communicating with both of said outer compression-chambers, said extension projecting through both explosion-chambers and having ports that communicate therewith.

18. In an engine, the combination with cylinders arranged in tandem, of pistons operating in the cylinders and subdividing each into an inner explosion and an outer compression chamber, a tubular rod connecting the pistons and having open ends communicating with both of said compression-chambers, said rod projecting through both of said inner explosion-chambers and having lateral ports communicating therewith, and means for closing the ports.

19. In an engine, the combination with explosion-chambers, of pistons operating therein, and a reciprocatory charge-conducting device having common ports for introducing charges to the different explosion-chambers.

20. In an engine, the combination with explosion-chambers, of pistons operating therein, and a reciprocatory charge-conducting device having a common port movable into communication with different chambers.

21. In an engine, the combination with explosion-chambers, of reciprocatory pistons operating therein, a charge-conducting device carried by the pistons and reciprocating in the different chambers and having a port that is movable into communication with said chambers.

22. In an engine, the combination with explosion-chambers, of pistons operating therein, a charge-conducting device movably extending into the chambers and having a port that is relatively movable into communication with said chambers, and means located within the device and stationary with respect thereto for cutting off communication between the ports and one of the chambers when said port is in communication with the other chamber.

23. In an engine, the combination with explosion-chambers, of a partition-wall separating the same, pistons operating in the chambers, and a tubular connection between the pistons passing through the wall and having a port movable through said wall into the different explosion-chambers.

24. In an engine, the combination with explosion-chambers, of a partition-wall separating the same, pistons operating in the chambers, and a tubular connection between the pistons passing through the wall and having a port movable through said wall into the different explosion-chambers, said wall constituting means for cutting off communication between the port and one of the chambers when said port is located in the other chamber.

25. In an engine, the combination with explosion-chambers, of pistons operating therein, a tubular charge-conducting device movably extending into the chambers and having a port that is successively movable into communication with said chambers, and a plunger located within the charge-conducting device.

26. In an engine, the combination with cylinders disposed in tandem, of pistons operating in the cylinders, and a tubular connection between the cylinders, said tubular connection having a port movable into the different cylinders upon the reciprocation of the piston.

27. In an engine, the combination with cylinders arranged in tandem, of pistons operating in the cylinders and dividing the same into explosion and compression chambers, a tubular connection between the pistons having communication with the compression-chambers, and a port that is movable into communication with the explosion-chambers.

28. In an engine, the combination with cylinders arranged in tandem, of pistons operating in the cylinders and dividing the same into explosion and compression chambers, a tubular connection between the pistons having communication with the compression-chambers, a port that is movable into communication with the explosion-chambers, and a stationary plunger located within the connection.

29. In an engine, the combination with cylinders arranged in tandem, of a division-wall separating the cylinders, pistons operating in the cylinders and subdividing the same into inner explosion-chambers and outer compression-chambers, a tubular connection between the pistons having open ends communicating with the compression-chambers, said connection having a port movable through the division-wall into the different explosion-chambers, and means located in the connection at the division-wall for cutting off communication between the ends of the connection.

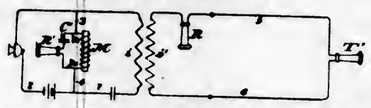
30. In an engine, the combination with a cylinder, of a reciprocatory piston located therein, another cylinder, means for securing the other cylinder in tandem relation upon the first-mentioned cylinder, a reciprocatory piston located in said second cylinder, and means for connecting the pistons.

31. In an engine, the combination with a cylinder having a head provided with an opening, of a reciprocatory piston located in the cylinder, another cylinder having a head provided with an opening, means for securing the other cylinder in tandem relation upon the first-mentioned cylinder with the heads abutted and the openings alined, a reciprocatory piston located in the second cylinder, and means passing through the openings for connecting said pistons.

32. In an engine, the combination with a cylinder, of a removable head for the same having an opening, a reciprocatory piston located in the cylinder, another cylinder, a removable head for said second cylinder having an opening, a reciprocatory piston operating in the second cylinder, common bolts for securing the heads to the cylinders and the cylinders to each other with the openings in the heads alined, and a rod connection between the pistons, said connection passing through the openings.

33. In an engine, the combination with a cylinder having a curved wall and spaced exhaust-openings therein, of outstanding angularly-disposed walls connected to said curved wall on opposite sides of the exhaust-openings and having flat outer faces disposed in substantially the same plane, and an exhaust-pipe coupling secured against said outer flat faces.

809,186. **TELEPHONE SYSTEM.** HENRY A. JUDSON, Washington, D. C. Filed Sept. 9, 1905. Serial No. 277,700.



Claim.—1. In a telephone system, a talking-circuit comprising a direct path of negligible resistance for continuous current, a magnetic discharge-coil a transmitter and a source of current therein, and a shunt-path around the said coil only, said shunt opaque to continuous current but passing high-frequency currents directly, substantially as described.

2. In a telephone system, a transmitter and a source of current-supply, a condenser, and the primary winding of an induction-coil, all in series with each other, together with a bridge across the circuit in shunt of the condenser and primary, said bridge containing an electromagnet having windings of low ohmic resistance but high self-induction, substantially as described.

3. In a telephone system, a circuit containing a transmitter, a source of current-supply and the primary of an induction-coil, with a bridge across said circuit containing an electromagnet, substantially as described.

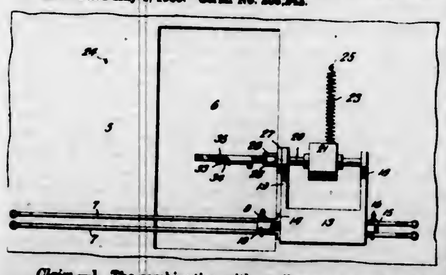
4. In a telephone system, a talking-circuit containing a transmitter, a battery and an electromagnet, with a shunt around said electromagnet only, said shunt containing a condenser and connected to line, substantially as described.

5. In a telephone system, a transmitter, a battery, and an electromagnet of relatively low ohmic resistance in series with the battery and transmitter, and a shunt around said magnet only, said shunt so arranged as to be practically opaque to continuous currents but transparent to periodic currents, substantially as described.

6. In a telephone system, a transmitter, a battery, and an electromagnet of relatively low ohmic resistance in series with the battery and transmitter, a receiving device and a shunt around said magnet opaque to direct current and including the line-circuit and the receiving device, substantially as described.

7. In a telephone system, a circuit containing a transmitter, a source of current-supply and the primary of an induction-coil, a secondary connected to line, and a bridge across said circuit containing a receiver and a condenser only, substantially as described.

809,187. **MAIL-DELIVERER.** HERBERT L. KIMMONS, Decker, Ind. Filed May 1, 1905. Serial No. 258,943.



Claim.—1. The combination with a railway-car of a horizontal guide secured to the car, a frame engaged with the guide and movable longitudinally thereof, a catcher connected with the frame and movable into and out of operative position, means for holding the catcher in inoperative position, means for holding the catcher in operative position, said means being shiftable with respect to the guide to lie at times with its catcher extending in one direction and at times with its catcher extending in opposite direction.

2. The combination with a railway-car having an opening in the wall thereof, of horizontal guides secured to the car, and a catcher connected with the guides and arranged for movement longitudinally thereof to lie at opposite sides of the opening, said catcher being arranged for movement to lie at times exteriorly of the car and in position to receive a mail-bag and at times interiorly of the car, means for holding the catcher yieldably in this last-named position, means for holding the catcher in position to receive a mail-bag, means for moving the second-named holding means into inoperative position, said third-named means being arranged for operation by the impact of a mail-bag engaged by the catcher said catcher being shiftable pivotally with respect to the guides to extend at times in one direction and at times in the opposite direction and means for holding the catcher against its pivotal movement with respect to the guides.

3. A catcher comprising spaced guide-rails, a plate pivotally and slidably engaged between the guide-rails, a frame secured to the plate and lying at one side of the guide-rails said frame being movable pivotally with the plate to extend in opposite directions, means for holding the frame and plate against pivotal movement and a catching device carried by the frame.

4. In a device of the class described the combination with a frame of a shaft revolubly mounted in a frame, a catcher carried by the shaft and movable into and out of operative position said catcher when in operative position being movable with the shaft into position to receive a mail-bag and into position to discharge the latter said catcher when in inoperative position being arranged to hold the shaft against rotation.

5. A device of the class described comprising a frame a shaft revolubly mounted in the frame a catcher carried by the shaft and movable with respect thereto into and out of operative position, said catcher when in operative position being movable with the shaft into position to receive a body and into position to discharge the latter, said catcher being arranged for coöperation with the frame when the catcher is in inoperative position to hold the shaft against rotation.

6. A device of the class described comprising a catching device movable into and out of position to receive a body, said device comprising a movable arm means carried by the arm for holding the catcher in position to receive a body said arm being movable by a body received by the catcher to bring the holding means into inoperative position and means for moving the catcher out of position to receive a body when the holding means is moved into inoperative position.

7. A device of the class described comprising a frame an arm carried by the frame and having a jaw at one end, a jaw pivoted to the arm for coöperation with the first-named jaw, means for holding the pivoted jaw yieldably at the limit of its movement toward the other jaw and means for holding the pivoted jaw against the action of the yieldable holding means, said second-named holding means including a portion lying in position for engagement by a body between the jaws for movement of said holding means into inoperative position.

8. A catching device comprising pivotally-connected jaws movable toward and away from each other, means for holding the jaws yieldably at the limits of their movements toward each other, a projection carried by one of the jaws and a latch pivoted to the other jaw for movement into and out of engagement with the projection, said latch being arranged when in engagement with the projection to hold the jaws against the action of the yieldable holding means said latch when in operative position lying in position for engagement by a body between the jaws for movement of the latch by said body into inoperative position.

809,188. **TAG-STAMPING DEVICE.** CHARLES C. KING, Louisville, Ky. Filed Feb. 4, 1905. Serial No. 244,133.

Claim.—1. A device of the kind described comprising a frame, the lower ends of which are connected by parallel bars, a pair of axles adjustably mounted in vertical slots at the opposite end of the frame, each axle carrying a series of rollers, and the endless type-bands movable around the rollers and bottom bars.

2. A device of the kind described comprising a frame having the parallel bottom bars, parallel axles mounted in slots near the opposite end of the frame, each axle having a series of rollers arranged to turn thereon, the endless type-bands adapted to travel around the

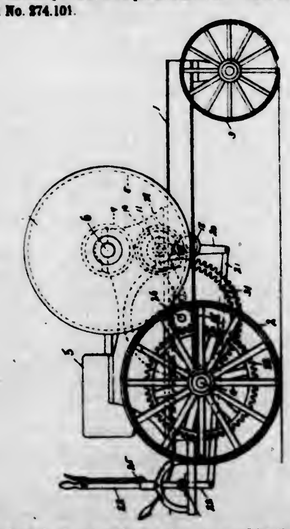
rollers and bars and screws carried by the cover-plate and passing through the axle for adjusting the axles for the purpose described.

3. A device of the kind described comprising a frame having the parallel bottom bars connected thereto, parallel axles mounted in the frame, the rollers arranged upon the axles and the type-bands adapted to travel around the rollers and bottom bars, a cover-plate connected to the top of the frame and the adjusting-screws carried by the cover-plate and passing through the ends of the axles whereby said axles are adjustable with reference to the bottom bars, all of said parts being arranged and adapted to operate substantially as described.

4. A device of the kind described comprising a frame, the lower ends of which are connected by parallel bars, a pair of axles having squared ends mounted in vertical slots at the opposite end of the frame, and the adjusting-screws carried by the cover-plate and passing through the ends of the axles, for the purpose described.

5. A device of the kind described comprising a frame, the lower ends of which are connected by parallel bars, a pair of axles having squared ends mounted in vertical slots at the opposite end of the frame, each axle carrying a series of rollers, the endless type-bands adapted to travel around the rollers and bars, and adjusting-screws mounted in slotted lugs of the cover-plate and passing through the end of the axle for the purpose described.

809,189. **TRACTION-ENGINE.** MOSES W. KOUNS, Washington Court-House, Ohio, assignor to The Ohio Manufacturing Company, Upper Sandusky, Ohio, a Corporation of Ohio. Filed Aug. 14, 1905. Serial No. 274,101.



Claim.—1. In a traction-engine, the combination, with a frame and driving ground-wheels supporting the same, of an engine of the character described mounted on said frame, a shaft driven by said engine and having a friction-wheel with concentric internal and external annular friction-surfaces, a counter-shaft provided with a friction-wheel located between said friction-surfaces and connected with the driving ground-wheels by suitable gearing, and means for relatively moving said shafts to bring the counter-shaft friction-wheel into contact with either the internal or external friction-surface of the other friction-wheel, substantially as described.

2. In a traction-engine, the combination, with a frame and driving ground-wheels supporting the same, of an engine of the character described mounted on said frame, a shaft driven by said engine and having a friction-wheel with concentric internal and external annular friction-surfaces, a counter-shaft provided with a friction-wheel located between said surfaces and connected with the driving ground-wheels by suitable gearing, and means for moving said counter-shaft toward and from the other shaft to bring the counter-shaft friction-wheel into contact with either the internal or external friction-surface of the other friction-wheel, substantially as described.

3. In a traction-engine, the combination, with a frame and driving ground-wheels supporting the same, of an engine of the character described mounted on said frame, a shaft driven by said engine and having a friction-wheel with concentric internal and external annular friction-surfaces, a counter-shaft provided with a friction-wheel located between said friction-surfaces and connected with the driving ground-wheels by suitable gearing, pivoted arms supporting said counter-shaft, and means for actuating said arms to move the counter-shaft toward and from the other shaft and bring the counter-shafttfriction-wheel into contact with either the internal or external friction-surface of the other friction-wheel, substantially as described.

4. In a traction-engine, the combination, with a frame and driving ground-wheels supporting the same, of an engine of the character described mounted on said frame, a shaft driven by said engine and having a friction-wheel with concentric internal and external annular friction-surfaces, a counter-shaft provided with a friction-wheel located between said friction-surfaces and connected with the driving ground-wheels by suitable gearing, pivoted arms supporting said counter-shaft, and means for actuating said arms to move the counter-shaft toward and from the other shaft and bring the counter-shaft friction-wheel into contact with either the internal or external friction-surface of the other friction-wheel, said means comprising an eccentric engaging one of the arms, a hand-lever, and operative connections between said hand-lever and eccentric, substantially as described.

5. In a traction-engine, the combination, with a frame and driving ground-wheels supporting the same, of an engine of the character described mounted on said frame, a shaft driven by said engine and having a friction-wheel with concentric internal and external annular friction-surfaces, an intermediate shaft operatively connected with the ground-wheels and provided with a gear, a counter-shaft having a pinion to mesh with said gear and a friction-wheel located between the friction-surfaces of the other friction-wheel, arms supporting said counter-shaft at their free ends and pivotally supported at their other ends to move in an arc substantially concentric with the intermediate shaft, and means for actuating said arms to bring the counter-shaft friction-wheel into contact with either the internal or external friction-surface of the other friction-wheel, substantially as described.

6. In a traction-engine, the combination, with a frame and driving ground-wheels supporting the same, of an engine of the character described mounted on said frame and having a crank-shaft provided with a fly-wheel having concentric internal and external annular friction-surfaces, a counter-shaft provided with a friction-wheel located between said friction-surfaces and connected with the driving ground-wheels by suitable gearing, and means for relatively moving said shafts to bring the counter-shaft friction-wheel into contact with either the internal or external friction-surface of said fly-wheel, substantially as described.

7. In a traction-engine, the combination, with a frame and driving ground-wheels supporting the same, of an engine of the character described mounted on said frame, a shaft driven by said engine and having two friction-wheels, each provided with concentric internal and external annular friction-surfaces on its inner face, a counter-shaft extending between said friction-wheels and having at each end a friction-wheel located between the friction-surfaces of the corresponding friction-wheel on the driven shaft, said counter-shaft being connected with the driving ground-wheels by suitable gearing, and means for relatively moving said shafts to bring the counter-shaft friction-wheels into contact with either the internal or external friction-surfaces of the other friction-wheels, substantially as described.

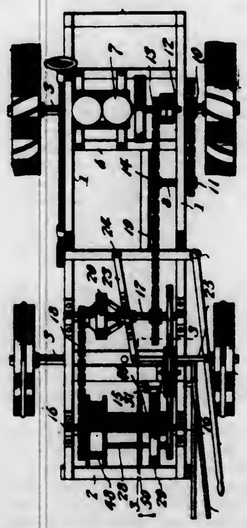
8. In a traction-engine, the combination, with a frame and driving ground-wheels supporting the same, of an engine of the character described mounted on said frame, a shaft driven by the engine and having two friction-wheels with concentric internal and external annular friction-surfaces on their adjacent faces, an intermediate shaft having a driving connection with the ground-wheels and

provided with a gear, a counter-shaft extending between the friction-wheels of the driven shaft and provided at its ends with friction-wheels located between the friction-surfaces thereof, said counter-shaft having a pinion to mesh with the gear of the intermediate shaft, arms supporting said counter-shaft at their free ends and pivotally supported at their other ends to move in an arc substantially concentric with the intermediate shaft, a rock-shaft provided with eccentrics engaging said arms to actuate the same, a hand-lever, and operative connections between said hand-lever and rock-shaft, substantially as described.

9. In a traction-engine of the character described, a driving friction-wheel having concentric internal and external annular friction-surfaces, a counter-shaft having a friction-wheel located between said friction-surfaces, pivoted arms supporting said counter-shaft, one of said arms having adjacent projections, a rock-shaft having an eccentric thereon provided with an annular flange engaging between the adjacent projections of the arm, and means for operating said rock-shaft, substantially as described.

10. In a traction-engine of the character described, a driven shaft having two friction-wheels thereon provided with concentric internal and external annular friction-surfaces, a counter-shaft provided with friction-wheels located between said surfaces, arms supporting said counter-shaft at their free ends and pivoted at their other ends, said arms having adjacent projections, a rock-shaft having eccentrics thereon provided with annular flanges engaging between the projections of the arms, and means for operating said rock-shaft, substantially as described.

809,190. **WELL-PULLING MACHINE.** OLIVER D. KRAFT and LOUIS W. FETZER, Findlay, Ohio. Filed June 9, 1905. Serial No. 264,880.



Claim.—1. In a machine of the class set forth, the combination with a drive-shaft provided with a gear, a drum provided with a gear, a power-transmitting member carried by the drum and the shaft, a clutch member carried by the shaft by means of which said power-transmitter can be thrown into and out of operation, and vertically-adjustable gears adapted to be brought into engagement with the said first-named gears, whereby the direction of rotation of the drum may be changed, said gears being freely removable.

2. In a machine of the class set forth, the combination with a drive-shaft provided with a gear, a drum provided with a gear, a power-transmitting member carried by the drum and the shaft, a clutch member carried by said shaft by means of which the power-transmitter can be thrown into and out of operation, and a frame provided with gears adapted to be brought into engagement with said first-named gears, whereby the direction of rotation of the drum may be changed.

3. In a machine of the class set forth, the combination of a drive-shaft provided with a gear, a drum provided with a gear, a power-transmitting member carried by the drum and the shaft, a clutch member carried by said shaft by means of which the power-transmitter can be thrown into and out of operation, a frame provided with gears adapted to be brought into engagement with said first-named gears, whereby the direction of rotation of the drum may be changed, and means for retaining the last-named gears normally out of engagement with the first-named gears.

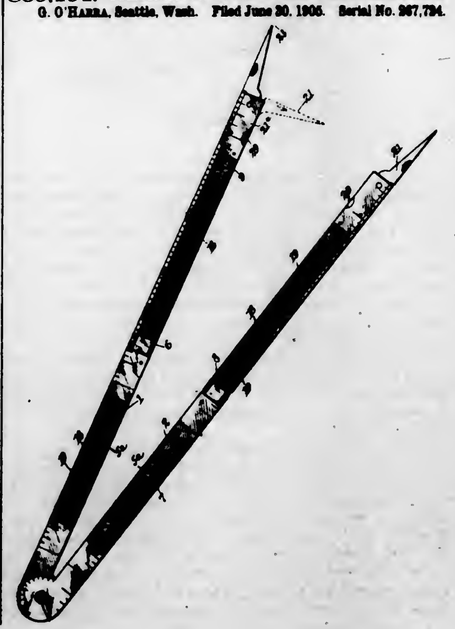
4. In a machine of the class set forth, the combination with a drive-shaft provided with a gear, a drum provided with a gear, a power-transmitting member carried by the drum and the shaft, a clutch member carried by said shaft by means of which the power-transmitter can be thrown into and out of operation, vertically-adjustable gears adapted to be brought into engagement with said first-named gears whereby the direction of rotation of the drum may be changed, and means for retaining said last-named gears normally out of engagement with said first-named gears.

5. In a machine of the class set forth, the combination with a drive-shaft provided with a gear, a drum provided with a gear, a power-transmitting member carried by the drum and said shaft, a clutch member carried by said shaft to throw said power-transmitter into and out of operation, and vertically-adjustable gears adapted to be brought into engagement with said first-named gears, whereby the direction of rotation of the drum may be changed.

6. In a machine of the class set forth, the combination with a drive-shaft provided with a gear, a drum provided with a gear, a power-transmitting means interposed between the drum and said shaft, a clutch carried by said shaft and adapted to control said power-transmitting means, means for operating said clutch, a vertically-adjustable gear adapted to be brought into engagement with said first-named gears to change the direction of rotation of the drum, means for operating said last-named gear, a brake-band for said drum, and means for operating said brake-band.

7. In a machine of the class set forth, the combination with a drive-shaft provided with a gear, a drum provided with a gear, a power-transmitting member carried by the drum and the shaft, a clutch member carried by the shaft by means of which the power-transmitter can be thrown into and out of operation, and a vertically-adjustable gear adapted to be brought into engagement with said first-named gear when said power-transmitting member is thrown out of operation.

809,191. **COMBINATION-TOOL.** EDWARD J. LA DUKE and ISAAC G. O'HARRA, Seattle, Wash. Filed June 20, 1905. Serial No. 267,794.



Claim.—A tool of the class described, comprising two pivoted legs having limbs with connecting-joints, one of said limbs at each joint having a head presenting three flat faces, a spring attached to the opposite limb and engaging said faces, respectively, to hold said limbs in rigid relation, the outer of said limbs having sockets, and pivoted blades carried by said outer limbs and normally lying in said sockets.

809,192. **REPAIRING DEVICE FOR VEHICLES.** CHARLES W. LAVERS, Halifax, Canada. Filed July 20, 1905. Serial No. 270,626.

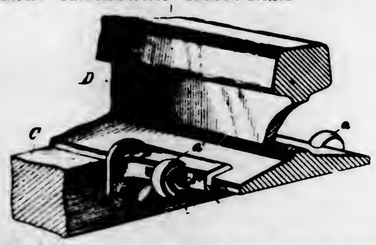
Claim.—1. In a repairing device for vehicles, a splice-bar provided with a wheel-spindle at one end, a hook at the opposite end, and a central longitudinal recess, in combination with clips for securing said splice-bar to a broken portion of the vehicle, substantially as described.

2. A repairing device for vehicles comprising a splice-bar having a central longitudinal recess, an axle-spindle at one end and a hook at the other, and clamps for holding the same in place upon a broken portion of a wheeled vehicle, substantially as described.

3. A repairing device for vehicles comprising a splice-bar having a spindle at one end and clips for securing the splice-bar in place, said spindle having a threaded socket in its end to accommodate a threaded bolt, said spindle also having a threaded end of opposite pitch to the socket, substantially as described.

4. A repairing device for vehicles comprising a splice-bar having a wheel-spindle at one end, a hook at its opposite end, clips for securing the device in place, said spindle having a threaded outer end and a socket provided with threads of opposite pitch to the threads on the end of the spindle, and means for binding the clips against the splice-bar, substantially as described.

809,193. **ANTICREEPING DEVICE.** JOHN R. LIGGETT, Cumberland, Md. Filed June 3, 1905. Serial No. 263,581.



Claim.—1. An anticreeping device substantially as herein described comprising an abutment-section having a cuff provided with a plate to underlie the edge of a rail-base and with a top plate to overlie said base, the outer side of said cuff being inclined or tapered toward one end and provided at the larger end of said cuff with a depending plate to abut a cross-tie, and a cross-piece provided at its ends with upturned hooks to engage the edge of a rail-base and the outer side of the cuff of the abutment-section, said hooks being comparatively narrow whereby they may cant or rock in the initial creeping movement of the rail, substantially as set forth.

2. An anticreeping device for railroad-rails comprising a cuff having plates overlying and underlying and adapted to receive between them the edge of a rail-base, and a cross-piece having means for engaging said cuff and the opposite side of a rail-base, substantially as set forth.

3. The combination in a device for preventing rails from creeping, of a cuff-section adapted to embrace the edge of a rail-base and tapered or inclined on its outer side, of a cross-bar having at one end a hook engaging the outer side of said cuff and adapted to rock in engagement therewith, means being provided at the opposite ends of the cross-bar for engagement with the rail-base and adapted to rock in its said engagement, substantially as set forth.

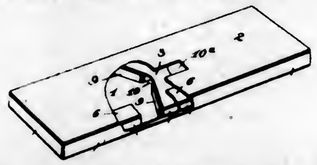
4. An anticreeping device comprising a cuff adapted to embrace a rail-base and having its outer side inclined or tapered and means engaging with said inclined or tapered side for binding the cuff to a rail-base, substantially as set forth.

5. An anticreeping device consisting of an abutment-section having a cuff provided with upper and lower plates to fit above and below the edge of a rail-base and a depending plate at one end of said cuff to engage with a cross-tie and a cross-bar hooked at its ends to engage with said cuff and the opposite edge of a rail-base to which said cuff is fitted, substantially as set forth.

6. An anticreeping device comprising an abutment-section adapted to fit one edge of a rail-base and a cross-bar provided at its opposite ends with upturned hooks rounded in the direction of length of the rail and adapted to engage with the outer side of the abutment-section and with the opposite edge of a rail-base and to rock or cant in the direction of length of said rail in the initial movement of a rail, substantially as set forth.

7. An anticreeping device comprising an abutment-section to engage one edge of a rail-base and a cross-bar having at its ends upturned hooks to engage said abutment-section and the opposite edge of a rail-base and made in sections adjustably connected whereby the said cross-bar may be adjusted as to length substantially as set forth.

809,194. **PROTECTOR FOR SPECTACLES.** CHARLES B. LEWIS, Peru, Ill. Filed Mar. 13, 1905. Serial No. 249,880.



Claim.—1. A spectacle or the like case having upwardly-projecting walls, spaced apart, to receive the nose-piece of a pair of spectacles or the like between them, and a bridge-piece to fit over, engage the said walls, bridge the space and cover the nose-piece of the spectacles between them, substantially as described.

2. A spectacle or the like case, having a base provided with upwardly-projecting walls, spaced apart, to receive the nose-piece of a pair of spectacles or the like between them, a bridge-piece to fit over, engage the said walls, bridge the space and cover the nose-piece of the spectacles between them, and a cover to close over the said base and the said bridge-piece, substantially as described.

3. A spectacle or the like case, having a base provided with two pairs of upturned, outwardly-diverging walls spaced apart to receive the spectacle nose-piece between them, and a bridge-piece, having similarly-disposed pairs of diverging walls, to close over and engage the first-mentioned walls and cover the spectacle nose-piece between them, substantially as described.

4. A spectacle or the like case formed of a single piece of material to provide a base, a cover, and side walls, said base being provided with upturned spaced walls to receive the nose-piece of a pair of spectacles or the like between them, and one of said side walls being formed with a bridge-piece to close over and engage the spaced walls, and to cover the spectacle nose-piece between them, the said cover being adapted to close over the said bridge-piece, substantially as described.

5. A spectacle or the like case comprising a base, a cover and side walls, said base being provided with upturned spaced walls to receive the nose-piece of a pair of spectacles or the like between them, and one of said side walls being formed with a bridge-piece to close over and engage the spaced walls, and to cover the spectacle nose-piece between them, the said cover being adapted to close over the said bridge-piece, substantially as described.

809,195. **BOBBIN-TRAY.** JOHN LLOYD, Bridgeport, Conn. Filed Apr. 10, 1905. Serial No. 254,741.

Claim.—1. In a bobbin-tray the combination with a frame, of a series of longitudinal wire supports, each bearing a series of pins arranged at proper distances apart, and transverse stay-wires to engage the longitudinal wires intermediate of the pins.

2. In a bobbin-tray of the class described, the combination with a suitable frame, of a series of supporting-wires attached thereto, each containing pins formed at a right angle to and of the wires of the support, and transverse stay-wires to engage said supporting-wires intermediate of said pins and arranged at a right angle thereto.

3. In a bobbin-tray of the class described, the combination with a frame, of a series of longitudinal wire supports attached thereto, a series of twisted pins formed of and integral with the wire of the supports, and transverse stay-wires connecting the longitudinal supports.

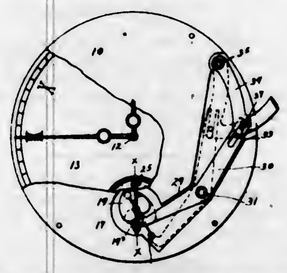
4. In a bobbin-tray of the class described, the combination with a frame, of a series of wire supports arranged parallel and attached to said frame, a series of twisted pins disposed therefrom formed of and integral with the wires of the support, and wires arranged at a right angle to said supports for retaining said supporting-wires at a proper distance apart.

5. In a bobbin-tray of the class described, the combination with a suitable frame, of parallel supporting-wires, each having a series of folded and twisted loops therein to form pins, wires for retaining said loops in a closed position, and wires for retaining the supporting-wires at a proper distance apart.

6. In a bobbin-tray of the class described, the combination with a substantially rectangular frame, of a series of longitudinal wire supports attached thereto and containing integral pins, and transverse wires connecting the frame and supports intermediate of the said pins.

7. In a bobbin-tray of the class described, the combination with a suitable frame, of a series of parallel wire supports connected to the ends of the frame, a series of pins formed of and integral with each of said wire supports, a series of wire braces attached to the sides of the frame and connecting the said supports.

809,196. **STOP-WATCH.** ALBERT C. LOKER, Kansas City, Mo. Filed Apr. 21, 1905. Serial No. 256,706.



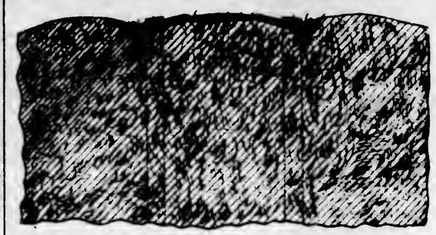
Claim.—1. In a watch or timepiece the combination with a hand-setting lever having a slot at its upper end, a suspended arm pivotally connected with the slotted end of said lever and an operating branch portion extending outwardly therefrom.

2. The combination with the bottom plate of a watch or timepiece supporting the watch-movement of a time-indicator shaft, an independent bearing for the hands of the watch, having a socket adapted to receive the end of said indicator-shaft, a cam upon said bearing, a pivoted lever upon the bottom plate, an extension of one end of said lever adapted to engage with the cam, said lever having a slot at the other end, a suspended arm pivotally connected with the slotted end of said lever, and an operating branch portion of said arm extending outwardly therefrom.

3. The combination with the bottom plate of a watch or timepiece supporting the watch-movement having a recess, a shaft opening therein, an indicator-shaft extending through said opening, an independent bearing for the hands, having a socket adapted to fit the end of said shaft, a cam having a notch upon said bearing within said recess, said bottom plate having a recess communicating with the recess near the shaft, opening and extending to the edge of the bottom plate, a lever pivoted in said latter recess, a projection at one end engaging with the notch in said cam; said lever having a slot in the upper end, a suspended arm having a bent portion and a pin extending in the slot in the said lever.

809,197. **SELF-FASTENING COTTON-MARKER.** GEORGE W. LOWE, Hindsay, Ind. Ter. Filed July 11, 1905. Serial No. 269,269.

Claim.—1. A marker for cotton-bales and the like, consisting of a sheet-metal plate having perforations near each corner, and perforations intermediate said end perforations, smooth wires or rods threaded through said intermediate perforations, and bent downwardly passing through the end perforations, the ends of said rods having V-shaped slits, whereby when pressure is exerted on the bale during compression, the split ends of the rods or wires will be forced into the bale and spread apart, to retain the plate on the bale.



2. A marker for cotton-bales and the like, comprising a curved sheet-metal plate having an arched central portion and provided with perforations at the sides of said arched portion, said plate being further provided with perforations near each corner and in longitudinal alinement with the perforations at the sides of the arched portion, and rods or wires threaded through the perforations of the arched portion and having their ends bent downwardly through the end perforations, the extreme ends of said rods or wires having V-shaped slits, whereby the ends of said rods will be caused to spread apart by pressure during compression of the bale and secure the marker to the bale.

3. A marker for cotton-bales and the like, comprising a sheet-metal plate having parallel rows of perforations, and smooth rods or wires threaded through said perforations, the ends of the rods being bent downwardly and provided with V-shaped slits, whereby the slitted ends of the rods or wires will be caused to spread apart by pressure during compression of the bale, and thereby secure the plate to the bale.

809,198. **COIN-CONTROLLED SCALE.** JOHN LORENTZEN, Duluth, Minn. Filed Oct. 13, 1904. Serial No. 228,236.

Claim.—1. The combination in a weighing-scale, of a platform, a shaft to which revoluble movement is imparted on the depression of the platform, a pointer, a clutching-sleeve for connecting the hand or pointer to the shaft, and a coin-controlled cam-slide for moving said sleeve.

2. The combination in a weighing-machine, of a platform, a shaft to which revoluble movement is imparted on the depression of the platform, an indicating means normally disconnected from the shaft, a clutch-sleeve for connecting the indicating means to the shaft, and a coin-actuated cam-slide for operating said clutch-sleeve.

3. The combination in a weighing-scale, of a platform, a shaft receiving revoluble movement on the depression of the platform, an indicating means normally disconnected from the shaft, a slidable clutching-sleeve for clutching the indicating means to the shaft, a cam-slide engaging said sleeve, said cam-slide having a coin-seat, and a movable coin-engaging bar through which the slide may be actuated, after the insertion of a coin, to move said sleeve to clutching position.

4. In a weighing-scale, a platform, a shaft to which revoluble

movement is imparted on the depression of the platform, a clutch-sleeve mounted on the shaft, an indicating means normally disconnected from the clutch-sleeve, a coin-actuated slide having an inclined face forming a coin-rest, said slide being provided with a cam for engaging and moving the slide to clutching position, and a push-bar serving when depressed to engage and force a coin against the rest, and thus transmit longitudinal movement to the slide.

5. The combination in a weighing-scale, of a platform, a shaft to which revoluble movement is imparted by depression of the platform, a clutch-sleeve mounted on the shaft, an indicating means normally disconnected from the clutch-sleeve, a slidable cam for engaging and moving the clutch-sleeve to operative position, said slidable cam having a groove provided with an inclined wall forming a coin-rest, and a push-bar adapted to engage a coin and force the same against the rest, said push-bar having a pendent finger to prevent premature escape of the coin.

6. The combination with a weighing-scale, of a platform, a shaft, means including a pair of friction-disks for transmitting movement from the platform to the shaft, one of said disks having a projecting shoulder, a clutch, an indicator, a coin-actuated cam-slide for moving said clutch to operative position, and a pivotally-mounted lever connected to the slide and disposed in the path of movement of said shoulder thereby to restore the parts to initial position.

7. In coin-controlled mechanisms, a coin-actuated slide, a movable member receiving revoluble movement first in one direction and then in the opposite direction, said member being provided with a projecting shoulder, and a lever connected to the slide and having one end disposed in the path of movement of the shoulder thereby to restore the slide to initial position.

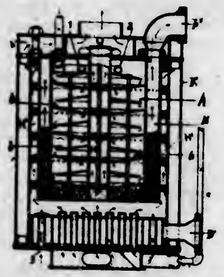
809,199. MOLD. WILLIAM H. LUCAS, Newark, Ohio. Filed Aug. 31, 1905. Serial No. 276,883.

Claim.—1. A mold of the character described comprising a plurality of side sections forming the body of the mold, a top-supporting ring, V-shaped adjustable braces adapted to hold said ring in place, means whereby the lower ends of said braces are engaged with the upper ends of the side sections, means whereby the upper ends of the braces are adjustably connected to said ring, top plates or sections arranged on said side sections and supporting-ring, inner and outer neck-forming casings, and means arranged on said casings to form an opening or passage through the neck, substantially as described.

2. A mold of the character described comprising a plurality of side sections forming the body of the mold, a top-supporting ring, adjustable, V-shaped braces adapted to hold said ring in place, top sections or plates supported on said ring and the upper ends of the side sections, inner and outer neck-forming casings arranged above said top plates, said casings having formed therein openings, passage-forming plates or walls arranged between said casings, said walls being formed by bending inwardly the material cut out to form the opening in the outer casing, and hooks adapted to connect and brace the edges of the openings in said plates, substantially as described.

809,200. APPARATUS FOR VAPORIZING LIQUID COMBUSTIBLES. JOSEPH LÖSER, Aix-la-Chapelle, Germany. Filed Nov. 17, 1903. Serial No. 181,553.

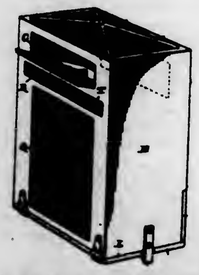
Claim.—1. An apparatus for converting liquid combustibles into gases consisting of a combination of a generator, means for supplying liquid thereto, said generator being fitted with a succession of downward-shelving surfaces over which the liquid is spread and from which it drains to the next lower surface, means for heating said surfaces, a perfector charged with loose permeable material in communication with said generator, means for heating the perfector and through which perfector the product of the partial distillation in the generator is required to pass and be therein filtered and entirely gasified.



2. An apparatus for converting liquid combustibles into gases consisting of a combination of a generator, means for supplying liquid thereto, said generator being fitted with a succession of downward-shelving surfaces of undulating form and penetrable character over and through which the liquid is spread and from which it drains to the next lower surface, means for heating said surfaces, and a perfector charged with loose permeable material in communication with said generator, means for heating the perfector and through which perfector the product of the partial distillation in the generator is required to pass and be therein filtered and entirely gasified.

3. An apparatus for converting liquid combustibles into gases consisting of a combination of a generator, means for supplying liquid thereto, said generator being fitted with a succession of downward-shelving surfaces over which the liquid is spread and from which it drains to the next lower surface, means for heating said surfaces, a perfector charged with loose permeable material in communication with said generator, means for heating the perfector and through which perfector the product of the partial distillation in the generator is required to pass and be therein filtered and entirely gasified, and a cooling-receiver into which the products of distillation are led such receiver being charged with the liquid destined to be converted into gas.

809,201. RECEIVING-BASIN. ALEXANDER LUTE, New York, N. Y., assignor to The United States Sanitary and Utility Sewage Disposal Company, New York, N. Y., a Corporation of New Jersey. Filed Aug. 26, 1905. Serial No. 275,827.



Claim.—1. The combination with a receiving-basin having an inlet and an outlet, of a basket adapted to be removably placed in the same and comprising a sheet-metal receptacle having an inlet on one side with an apron extending therefrom to the back, and a screened discharge-opening beneath said apron and in the front side.

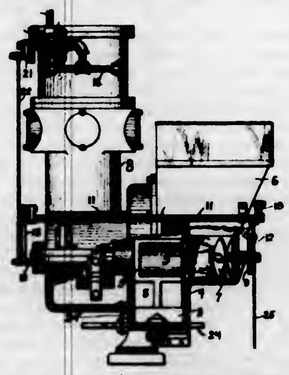
2. The combination with a suitable receiving-basin having an inlet and an outlet, of a basket within the basin adapted to receive the flow from the inlet, a screened opening in the front of the basket to permit the escape of water and additional openings above said screened opening to accommodate the overflow from said basket.

3. The combination with a receiving-basin, of a removable basket contained therein and comprising an inlet having an apron to conduct the water across the basket, screened openings beneath the apron, a coarse horizontally-disposed screen within the basket beneath the apron, and an additional overflow-opening between said horizontally-disposed screen and the apron whereby the water is caused to rise through said horizontal screen and escape through said overflow-opening.

4. The combination with a receiving-basin, of a basket removably placed therein and having an inlet with an apron extended from the same across the basket and adapted to discharge the water in the rear of the basket, a vertically-disposed screened opening beneath the apron in the front of the basket, and an additional screened opening in the rear of the basket above the apron to accommodate an overflow of water.

5. The combination with a receiving-basin provided with vertically-disposed ways, of a basket adapted to be removably supported intermediate of said ways and containing an opening to receive the inflow of water, an apron extended from said inlet to deflect said inflow of water against the rear of the basket, a screened opening in the face of the basket beneath the apron, additional overflow-openings in the face of the basket and beneath the apron, a horizontally-disposed screen for said opening, and an additional screened opening in the rear of the receptacle above the apron.

809,202. MECHANICAL STOKER. ALBERT K. MANSFIELD, Salem, Ohio, and SAMUEL M. FELTON, Chicago, Ill. Filed Jan. 28, 1904. Serial No. 190,941.



Claim.—1. In a stoker, the combination, substantially as set forth, of a circular feed-chamber having a tangential nozzle and having a central feed-opening through one of its sides, a supply-hopper communicating with said feed-opening, a rotary feed-wing mounted in said feed-chamber and having a recess in axial prolongation of said feed-opening, and mechanism for rotating the feed-wing.

2. In a stoker, the combination, substantially as set forth, of a circular feed-chamber having a tangential nozzle and having a central feed-opening through one of its sides, a supply-hopper communicating with said feed-opening, a rotary feed-wing mounted in said feed-chamber and having a recess in axial prolongation of said feed-opening, mechanism for rotating the feed-wing, and an angularly-adjustable deflecting-rib mounted in said nozzle.

3. In a mechanical stoker, the combination, substantially as set forth, of a circular feed-chamber having a tangential discharge-nozzle, a feed-wing having an axial recess mounted for rotation in the feed-chamber, a feed-hopper having communication with the central portion of the feed-chamber and arranged to feed endwise into the axial recess of the feed-wing, a conveyer at the juncture of the hopper and feed-chamber, and mechanism for giving motion to said wing and to said conveyer.

4. In a mechanical stoker, the combination, substantially as set forth, of a feed-chamber having a discharge-nozzle, a feed-hopper arranged to deliver coal thereto, a rotary discharge device mounted upon a horizontal axis within the feed-chamber to expel the coal therefrom into the furnace, a fluid-pressure motor for rotating the discharge device continuously, a throttle-valve provided with a variable opening controlling the supply of fluid to said motor, and mechanism operated by the motor to actuate said throttle-valve, whereby the speed of rotation of said discharge device is automatically subjected to successive changes.

5. The combination of a feed-chamber having a horizontal discharge-nozzle at its base, a rotary wing provided with an axial recess and mounted for rotation in said feed-chamber, a feed-hopper having communication with the central portion of the feed-chamber and arranged to feed endwise into the axial recess of said wing, a motor, transmitting mechanism between the motor and said wing, and additional transmitting connections from the motor adapted to be connected with the shaking-grate.

6. In a mechanical stoker, the combination, substantially as set forth, of a feed-wing provided with a hub and blade mounted for rotation upon a horizontal axis and having at its hub an axial recess with an opening opposite the blade, and means for delivering coal into said recess and for guiding the coal when dumped from the recess and acted upon by the wing.

7. In a mechanical stoker, the combination, substantially as set forth, of a feed-wing provided with a hub and blade mounted for rotation upon a horizontal axis and having at its hub an axial recess with an end wall and with an opening opposite the blade, and means for delivering coal into said recess and for guiding the coal when dumped from the recess and acted upon by the wing.

8. In a mechanical stoker, the combination substantially as set forth, of a feed-wing provided with a hub and blade mounted for rotation upon a horizontal axis and having at its hub an axial recess with an opening at one end and with an opening opposite the blade, and means for delivering coal endwise into said recess and for guiding the coal when dumped from the recess and acted upon by the wing.

9. In a mechanical stoker, the combination, substantially as set forth, of a feed-wing provided with a hub and blade mounted for rotation upon a horizontal axis and having at its hub an axial recess open at one end and side, and a chamber inclosing said wing and having an inlet to deliver coal to said recess and an outlet for coal dumped from said recess and acted upon by the wing.

10. In a mechanical stoker, the combination, substantially as set forth, of a feed-chamber having a horizontal discharge-nozzle at its base and having a feed-opening leading into its side, a conveyer disposed within said feed-opening, a rotary shaft, and a wing carried by said shaft within said feed-chamber and having an axial recess communicating with said feed-opening and adapted to receive the fuel advanced therethrough by the conveyer, the inner wall of said axial recess coinciding substantially with the margin of said feed-opening.

11. In a mechanical stoker, the combination, substantially as set forth, of a feed-chamber having an outlet and a feed-opening, a rotary shaft, and a feed-wing carried by said shaft and disposed within said chamber and having its inner portion disposed at such radial distance from the axial line of the shaft as to provide the wing with an axial recess within the field swept through by said wing, said axial line being arranged to receive fuel entering through said feed-opening.

12. In a mechanical stoker, the combination, substantially as set forth, of a feed-chamber having a feed-opening leading into one of its sides, a rotary conveyer mounted at said feed-opening and adapted to feed fuel therethrough, a shaft mounted in the side of the feed-chamber opposite the conveyer and in axial line therewith, and a feed-wing having an axial recess carried by the shaft within the chamber.

13. In a mechanical stoker, the combination, substantially as set forth, of a feed-chamber having a horizontal discharge-nozzle and having a feed-opening leading into one of its sides, a shaft mounted in the chamber in axial alinement with said feed-opening, and a rotary wing disposed within the feed-chamber and carried by said shaft and having its inner portion at a distance from the common axial line of the shaft and feed-opening, whereby said wing is provided with an axial recess surrounded by the field swept through by said feed-wing, said axial recess being arranged to receive fuel entering through said feed-opening.

809,203. ANIMAL-TRAP. GEORGE J. MILLER, Radicott, Wash. Filed Mar. 23, 1905. Serial No. 251,709.

Claim.—1. In an animal-trap of the class indicated, the combination, with a horizontal base-frame, and bars which extend centrally across the same, of spring-jaws formed of a single piece of

spring-wire, the same being bent at its middle to form one of the jaws and coiled around the adjacent bar and crossed to and coiled about the other bar, the ends of the wire being extended and connected to form the other jaw, substantially as described

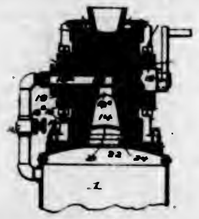
2. In a trap of the class indicated, the combination, with the horizontal base-frame, and bars traversing the same at its center, of spring-jaws having coils embracing the bars, a trigger for connecting the jaws when set, and a catch applied to the bars between the coils, for engaging the trigger, substantially as described.

3. The combination, with a horizontal base-frame and bars extending across the same, of a catch applied to said bars, spring-jaws, and a trigger for securing them when set, the same being adapted for engagement with the catch in the manner described.

4. The combination, with a horizontal base-frame, spring-jaws, and a catch arranged in the middle of the frame, of a trigger adapted to connect the jaws when set and to engage the catch, whereby the trigger is held until tripped, substantially as described.

5. The combination, with a horizontal base-frame, a U-shaped bolt passing through the same transversely, the spring-jaws formed of a wire coiled about the members of the bolt, and a trigger, of a T-shape catch, the members of the bolt passing through the body or head of the catch and the latter projecting upward, in the manner described.

809,204. SLAG STEAM-GENERATOR. GEORGE MITCHELL, Los Angeles, Cal. Filed July 27, 1905. Serial No. 271,514.

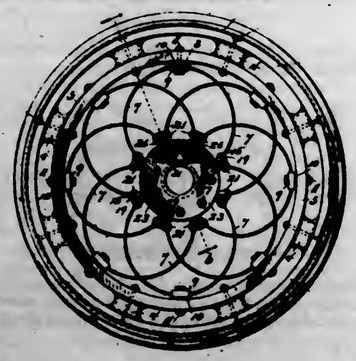


Claim.—1. The combination with a steam-generator having an opening in its top, of a rotary slag-carrier mounted horizontally over said opening and having a series of radial slag-receptacles, and adjustable means for forcing said rotary carrier down upon its seat over the opening in the top of the generator.

2. The combination with a steam-generator having a feed-opening in its top and a casing over the generator having a valve-seat communicating with said feed-opening, of a rotary slag-carrier disposed in said casing and having a series of radial slag-receptacles, and vertically-adjustable bearings for the journals of said rotary slag-carrier for pressing the latter down upon said valve-seat.

3. The combination with a steam-generator having an opening in its top, of a rotary slag-carrier disposed horizontally over said opening and having a series of radial slag-receptacles, standards at respective sides of said carrier, journal-boxes in said standards in which the journals of the carrier are mounted, and means in the standards for adjusting said boxes vertically.

809,205. VEHICLE-WHEEL. GEORGE D. MUMBRUE, New York, N. Y. Filed Mar. 20, 1905. Serial No. 251,108.



Claim.—1. In a vehicle-wheel, an inner rim, a hub, spring-spokes having their outer ends bent, a two-part clamp to adjustably hold the hub end of each spoke and having bearing in the hub, and a channel-shaped securing member having transverse beads over which the outer bent ends of said spokes take and around which said bent ends are capable of rotation, substantially as and for the purpose set forth.

2. In a vehicle-wheel, a hub having flanges and bearing-recesses formed in the flanges, in combination with spokes, a clamp to hold the hub end of the spokes, said clamp held and having bearing in said recesses, substantially as described.

3. In a vehicle-wheel, a spool-shaped hub having flanges at its ends, circular recesses formed in said flanges, in combination with spring-spokes, a two-part clamp to hold the hub end of each spoke and having a cylindrical portion to enter said recesses and a cover-plate to hold said clamps in the recesses, substantially as described.

4. In a vehicle-wheel, a spool-hub having flanges at its ends, circular recesses in each flange extending partly through them, in combination with spring-spokes, a two-part clamp having a cylindrical portion, to hold the hub end of each spoke, said cylindrical portion having bearing in a recess in the hub-flange, plates having recesses to register with those in the flanges and secured to said flanges.

5. In a vehicle-wheel, a two-part spool-shaped hub having flanges at its ends, circular recesses in each flange extending partly through them, two-part cover-plates having circular recesses extending partly through them and registering with those in the flanges; in combination with a two-part clamp for the hub end of each spoke having a tubular portion to have bearing in the registering recesses and means to secure each plate to its respective flange.

6. In a vehicle-wheel, the combination with the spokes and a hub having recesses formed therein, of clamp members for the hub ends of the spokes having bearing ends retained in and having bearing in said recesses, a metallic piece between the bearing end of said clamp and the walls of the recess to take up wear and prevent rattling.

7. In a vehicle-wheel, the combination with spokes and a hub having cylindrical recesses around its periphery, of clamp members for the hub ends of the spokes having a cylindrical bearing end, retained in and having bearing in said recesses, cylindrical wear-pieces around said cylindrical end and circular washers in said recesses at the ends of said cylindrical bearing ends, said washers and wear-pieces of a metal differing from that of said members and hub.

809,206. MINING-MACHINE. DANIEL R. MURPHY, Scranton Hill, Pa., assignor to Joseph A. Jeffrey, Columbus, Ohio. Filed Feb. 23, 1904. Serial No. 194,586.

Claim.—1. In a mining-machine of the class described, the combination with the motor platform or carrier having a guideway formed therein and a cutter-frame adjustable relatively to the motor-carrier and having its rear end fitted into said guideway of a connecting and bracing bar extending forward from the motor-carrier, and means for adjustably securing the said bar to the cutter-frame, substantially as set forth.

2. In a mining-machine, of the class described, the combination of a motor platform or carrier, a cutter-frame having a central thrust-rail adjustable relatively to the motor-carrier and having its rear end loosely braced, and a connecting and bracing bar projecting forward from the motor-carrier and adjustably clamped to the said center rail of the cutter-carriage, substantially as set forth.

3. In a mining-machine of the class described, the combination of a cutting apparatus having a center thrust-rail, an engine or motor platform or carrier having abutments for the rear end of the center rail to hold it laterally in relation to the motor-carrier, and a connecting and bracing bar extending forward from the engine-carrier, and means for securing said bar to the center rail at either of several positions, substantially as described.

4. In a mining-machine of the class described, the combination of a cutter-carrier having a central thrust-rail, an engine or motor platform or carrier having a guideway for the rear end of the center rail, a screw-rod and nut interposed between the motor-carrier and the cutting apparatus for adjusting them relatively to each other, and a bracing and connecting bar supplemental to the aforesaid parts and interposed between the motor-carrier and the cutter-carrier, and means for securing said bar in either of several positions relatively to the cutter-carrier, substantially as set forth.

5. In a mining-machine of the class described, the combination of a cutter-carrier having a longitudinally-adjustable thrust-bar, an engine or motor platform or carrier having laterally-acting abutments for the rear end of the bar, a clamping device situated near the rear end of the said thrust-bar for connecting the motor-carrier and the cutter-carrier, and a supplemental clamping device for connecting together the said parts and situated at points in front of the motor-carrier, substantially as set forth.

6. In a mining-machine of the class described, the combination of a cutter-carrier having a longitudinally-arranged thrust-bar, an engine-platform or motor-carrier, a clamping-bolt at the rear end of the said cutter-carrier and supported by one of the said carriers, the other of said carriers having a slot for the movement of the bolt, and a supplemental clamping-bolt supported by one of said carriers at points in front of the motor-carrier, and a slotted bar for the said bolt supported by the other carrier, substantially as set forth.

7. In a mining-machine, the combination of the cutter-carrying frame, the motor-platform having a guideway into which the rear end of said cutter-carrying frame is fitted, the adjusting means interposed between the said frame and the said platform, the bracing-bar extending forward from said platform, and means for adjustably connecting said bracing-bar to the said cutter-carrying frame.

8. In a mining-machine, the combination of the motor-platform, the cutter-carrying frame adjustably connected to said platform, the bracing-bar extending forward from and detachably connected to said motor-platform, and the adjustable clamp between the said bracing-bar and the cutter-carrying frame.

9. In a mining-machine, the combination of the cutter-carrier, the engine-platform or motor-carrier the adjustable connecting means between the said carriers, the bracing-plate extending forward from said motor-carrier and having a longitudinal slot therethrough, and a clamping-bolt extending through said slot and adapted to clamp the cutter-carrier to the said bracing-plate in various positions of adjustment.

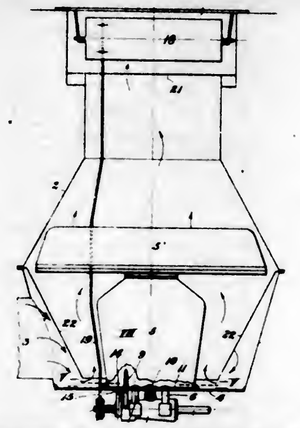
809,207. HEATING APPARATUS. OSCAR S. MCCURDY, Wilkinsburg, Pa. Filed Aug. 20, 1904. Serial No. 221,625.

Claim.—1. In air-heating apparatus, the combination of a heater, a surrounding air-shell, a register-valve controlling the outflow therefrom, a burner-valve, a combustion air-damper gearing connecting the burner-valve and air-damper, and means connected with the register-valve controlling the fuel and combustion air-supply, substantially as set forth.

2. In air-heating apparatus, the combination of a heater, a surrounding air-shell, a register-valve controlling the outflow therefrom, a burner-valve, a combustion air-damper, a fuel-valve stem provided with gearing in operative engagement with the air-damper, and connections between the valve-stem and the register-valve, substantially as set forth.

3. In air-heating apparatus, the combination of a heater, a surrounding air-shell, a pivoted register-valve controlling the outflow of the heated air, a burner-valve, a rotatable combustion air-damper provided with gear-teeth, a valve-stem provided with teeth engaging the damper-teeth and having a turning-arm, and connections between the register-valve and said arm, substantially as set forth.

4. In air-heating apparatus, the combination of a heater, a surrounding air-shell, a pivoted register-valve controlling the outflow of the heated air, a burner-valve having a variable-supply burner-outlet and a constant-supply pilot-outlet, a rotatable combustion air-damper provided with gear-teeth, a valve-stem provided with teeth engaging the damper-teeth and having a turning-arm, and connections between the register-valve and said arm, substantially as set forth.



5. In air-heating apparatus, the combination of a heater, a surrounding air-shell, a pivoted register-valve controlling the outflow of the heated air, a burner-valve, a rotatable combustion air-damper provided with gear-teeth, a valve-stem provided with teeth engaging the damper-teeth and having a turning-arm, and connections between the register-valve and said arm, substantially as set forth.

6. In air-heating apparatus, the combination with the air-heater, of a burner for heating the same, a valve for controlling the supply of fuel to the burner, a hot-air outlet from said heater, a valve in said outlet for controlling the flow of hot air therefrom into the place to be heated, an air-damper, a burner-valve stem having gear-teeth in rotatable engagement with said damper, and connections between the said hot-air valve and said burner-valve whereby the flow of fuel and air to the burner may be controlled by the movement of the hot-air valve, substantially as set forth.

7. In air-heating apparatus, the combination with a burner and heater chamber, of a base-plate provided with air-supply openings, a damper mounted thereon provided with registering air-openings, a burner-valve provided with fuel-supply pipes opening into the heater-chamber, and a valve-stem for said valve having gear-teeth in operative engagement with the damper, substantially as set forth.

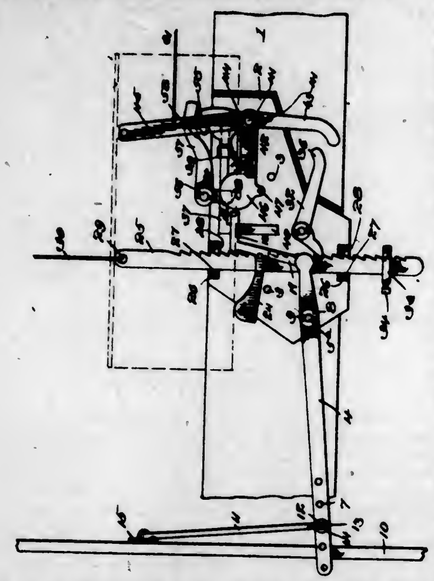
809,208. WINDMILL. MELCHOR S. NEWCOMER, Polo, Ill. Filed May 8, 1905. Serial No. 259,462.

Claim.—1. In a mechanism of the class described, the combination with a support, of a lever secured to said support, a slotted, weighted pawl carried by said lever, vane-connected means coacting with said pawl, longitudinally-movable guiding means engaging the slotted portion of said pawl, locking means for said vane-connected means, and means for retaining said guiding means in an adjusted position.

2. In a mechanism of the class described, the combination with a support and a pump-rod, of a lever provided with a bifurcated end mounted upon said support, means for adjustably connecting said lever to said pump-rod, a weighted, slotted pawl mounted upon the bifurcated end of said lever, a ratchet-bar positioned within said slotted pawl, a locking-pawl carried by said support and coacting with said ratchet-bar, movable guiding means coacting with and adapted to retain said slotted pawl in an adjusted position, and means for causing movement of said guiding means.

3. In a mechanism of the class described, the combination with a support and a pump-rod, of an apertured lever secured to said support, said lever provided with integral extensions, means adjustably connecting said lever to said pump-rod, a weighted primary pawl positioned upon the extension of the lever, an auxiliary pawl secured to said support, a ratchet-bar coacting with said primary and auxiliary pawls, an adjustable member secured to said ratchet-bar, longitudinal movable guiding means coacting with said primary pawl,

primary and auxiliary cranks carried by said support, means connecting said auxiliary crank to said guiding means and auxiliary pawl, a dog carried by said support and adapted to lock said guiding means and auxiliary crank in an adjusted position, said primary crank provided with a cam member, a weight carried by said primary crank, said cam member adapted to move said dog from a locked position, and means for actuating said primary crank.



4. In a mechanism of the class described, the combination with a support, of a lever provided with a bifurcated end mounted upon said support, a weighted pawl mounted upon the bifurcated end of said lever, a ratchet-bar secured contiguous to said pawl and coacting therewith, locking means carried by said support and coacting with said ratchet-bar, movable guiding means carried by said support and coacting with said pawl, and cranks carried by said support and coacting with said guiding and locking means

5. In a mechanism of the class described, the combination with a support and a pump-rod, a lever carried by said support, of means for adjustably connecting said lever to said pump-rod, a weighted, slotted pawl carried by said lever, a ratchet-bar positioned within said slotted pawl, locking means carried by said support and coacting with said ratchet-bar, movable guiding means coacting with and adapted to retain said slotted pawl in an adjusted position, and means for causing movement of said guiding means.

6. In a mechanism of the class described, the combination with a support, vane-connected means carried by said support, of a primary and an auxiliary pawl carried by said support and coacting with said vane-connected means, guiding means carried by said support and coacting with said primary pawl, a primary and an auxiliary crank carried by said support, said auxiliary crank connected to said guiding means, and means carried by said primary crank and adapted to engage said auxiliary crank for moving said auxiliary crank and thereby causing movement of said guiding means, primary pawl, and auxiliary pawl.

7. In a mechanism of the class described, the combination with a support, vane-connected means carried by said support, a primary member and an auxiliary member for controlling movement of said vane-connected means, of guiding means for said primary member, a weighted, primary crank and an auxiliary crank carried by said support, means connecting said auxiliary crank to said guiding means, said primary crank provided with means for engaging and causing movement of said auxiliary crank and auxiliary member, when said primary crank is moved rearwardly, and means for locking said auxiliary crank, guiding means, and auxiliary member in an adjusted position.

8. In a mechanism of the class described, the combination with a support, of vane-connected means carried by said support, a primary and an auxiliary member carried by said support and coacting with said vane-connected means for controlling movement thereof, guiding means for said primary member, a primary and an auxiliary crank carried by said support, means connecting said auxiliary crank and guiding means, means carried by said primary crank for actuating said auxiliary crank when said primary crank is moved rearwardly, said auxiliary crank adapted to move said auxiliary member to an inoperative position when rearward movement is imparted to said primary crank, and means for securing said auxiliary crank, guiding means, and primary and auxiliary members in an adjusted position.

9. In a mechanism of the class described, the combination with a support, vane-connected means carried by said support, actuating means carried by said support and coacting with said vane-connected means, locking means for said vane-connected means, of guiding means carried by said support and coacting with said actuating means, a crank carried by said support and movably connected to said guiding means, said crank adapted to adjust said locking means and retain it in an adjusted position, locking means for retaining said crank in an adjusted position, and means for actuating said crank.

10. In a mechanism of the class described, the combination with a support, vane-connected means carried by said support, actuating means for said vane-connected means, locking means for said vane-connected means, of a crank carried by said support, means movably connecting said actuating means to said crank, said crank adapted to move said locking means and to retain it in an adjusted position, and a weighted, primary crank carried by said support and capable of being moved for actuating said crank connected to said actuating means.

11. In a mechanism of the class described, the combination with a support, vane-connected means carried by said support, actuating means for said vane-connected means, locking means for said vane-connected means guiding means for said actuating means, of a crank carried by said support and pivotally connected to said guiding means, said crank adapted to move said actuating means to an inoperative position, a locking member for said crank, and means for actuating said crank.

809,209. LATCHING MECHANISM FOR EXCAVATOR-DIPPERS. MALACHI O'CONNOR, Oswego, N. Y. Filed Feb. 6, 1905. Serial No. 244,444.

Claim.—1. The combination of a latch, a yieldably-mounted carrier for said latch, a detent for maintaining the latch in its operative position, and means independent of the detent for limiting the motion of the latch.

2. The combination of a latch, a carrier for the latch, a spring for acting against the carrier to normally hold it in an advanced position, a detent for maintaining the latch in its operative position, and means independent of the detent, for limiting the motion of the latch.

3. The combination of a latch, a yieldably-mounted carrier for the latch, and a detent for the latch, supported by the carrier.

4. The combination of a latch, a yieldably-mounted carrier having a bifurcated portion, said latch being movably supported by the bifurcated portion, and a detent for the latch, also supported by said bifurcated portion.

5. The combination of a latch, a yieldably-mounted carrier for the latch, the latch being pivotally supported by the carrier, and a detent for the latch, also pivotally supported by the carrier.

6. The combination of a latch, a yieldably-mounted carrier for the latch, loops for guiding the carrier, a stop carried by one of the loops and serving to limit the motion of the latch with respect to its carrier, and a detent for the latch, supported by the carrier.

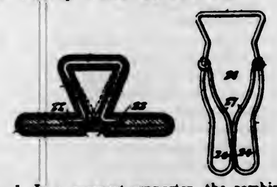
7. The combination of a latch having a hooked working end, a yieldably-mounted carrier for the latch, means for limiting the motion of the latch on its carrier, when the latch is in its operative position, and a movable detent for the carrier.

8. The combination of a perforated back plate, bolts countersunk in the perforations and extending through the back plate, a cover perforated to receive the bolts, the shanks of the latter being perforated, pins passing through the perforations of said shanks to hold the cover removably in place, a latch, a yieldably-mounted carrier for the latch, in said cover, and a detent housed by the cover, for said latch.

9. The combination of a latch, a yieldably-mounted carrier for the latch, a detent for the latch, and means for protecting the said parts from dust.

10. The combination of a latch, a yieldably-mounted carrier for the latch, having a bifurcated portion, a fixed device to limit the motion of the latch, a bail-form detent having an antifriction-roll constituting the effective portion of the detent and serving to engage the latch, said detent being supported by the carrier, and means for operating the detent.

809,210. GARMENT-SUPPORTER. BENJAMIN F. ORBWILER, Chicago, Ill. Filed Apr. 7, 1905. Serial No. 254,899.



Claim.—1. In a garment-supporter, the combination with a loop member, of a stud member coöperating therewith and including a stud having independent or separate side elements that are spaced apart and are movable toward each other under the compressing action of the surrounding loop member.

2. In a garment-supporter, the combination with a loop member, of a stud member coacting therewith and including a stud having spaced substantially straight side elements that converge toward their inner ends, said inner ends being disconnected or separated from each other and capable of movement toward each other under the compressing action of the surrounding loop member.

3. In a garment-supporter, the combination with a loop member, of a stud member coacting therewith and comprising a base, and a substantially triangular-shaped stud located on the base and arranged to be surrounded by the loop member, said stud having spaced side elements, the inner ends of which are connected to the base and are movable toward each other under the compressing action of the loop member.

4. In a garment-supporter, the combination with a loop member, of a stud member coacting therewith and comprising a base, and a stud having spaced side elements, said elements having their outer ends connected and their inner ends slidably mounted in the base and movable toward each other under the compressing action of the loop member.

5. In a garment-supporter, the combination with a loop member, of a stud member coacting therewith and comprising a base having a guideway, and a stud having spaced side elements, spaced portions of which are mounted in the guideway and movable therein toward each other under the compressing action of the loop member.

6. In a garment-supporter, the combination with a loop member, of a stud member coacting therewith and comprising a base having an opening, and a stud formed of a single looped piece having converging side elements that pass through the opening in the base and are provided with offset terminals.

7. In a garment-supporter, the combination with a loop member, of a stud member coacting therewith and including a stud having side elements that are spaced apart and are movable toward each other under the compressing action of the surrounding loop member, and a cushion carried by said stud.

8. In a garment-supporter, the combination with a loop member, of a stud member coacting therewith and comprising a base, a substantially triangular-shaped stud located thereon and arranged to be surrounded by the loop member, said stud having spaced side elements, the inner ends of which are connected to the base and are movable toward each other under the compressing action of the loop member, and a cushion surrounding the said members.

9. In a garment-supporter, the combination with a loop member, of a stud member coöperating therewith and comprising a base, a stud projecting from the base and including side elements connected by a top element, and a tubular cushion surrounding each of the side members and the top member.

10. In a garment-supporter, the combination with a loop member, of a stud member coöperating therewith and comprising a base, a stud projecting from the base and formed of a loop-strip having substantially straight side elements connected by a top element, and a tubular cushion surrounding each side and top element.

11. In a garment-supporter, the combination with a loop member, of a stud member coöperating therewith and comprising a base having an opening, a substantially triangular-shaped stud formed of a single piece having convergent side elements connected at their outer ends, the inner convergent ends of said elements passing through the opening and having outturned terminals, and a tubular cushion covering each of the side elements and extending about the top element, said side elements being movable toward each other under the compressing action of the loop member.

12. In a garment-supporter, the combination with a stud member, of a loop member coöperating therewith and comprising yielding loop-sections normally located out of alinement in different substantially parallel planes and movable laterally in their respective planes toward and from an alined position when engaged upon said stud member.

13. In a garment-supporter, the combination with a stud member, of a loop member coöperating therewith and comprising yielding stud-embracing sections, the inner sides of which are disposed in convergent relation between the outer sides and are movable toward a parallel relation when the stud member is engaged between them.

14. In a garment-supporter, the combination with a stud member, of a loop member coöperating therewith and comprising loop-sections located flat upon each other and disposed in angular relation, the inner sides of said sections being disposed across each other and being movable toward a parallel relation when the stud member is engaged between them

15. In a garment-supporter, the combination with a stud member, of a loop member coöperating therewith and comprising yielding loop-sections disposed in angular relation, each of said sections consisting of spaced side elements, one of the side elements of each section having a slidable engagement with one of the side elements of the other section.

16. In a garment-supporter, the combination with a stud member, of a loop member coöperating therewith and comprising loop-sections disposed in angular relation, each of the sections consisting of an inner and an outer side element, the inner side element of one of said sections having a slidable engagement with the outer side element of the other.

17. In a garment-supporter, the combination with a stud member, of a loop member coöperating therewith and comprising yielding loop-sections, each of said sections consisting of spaced inner and outer side elements, the inner side elements extending across each other and having terminal eyes slidably engaged with the outer side elements.

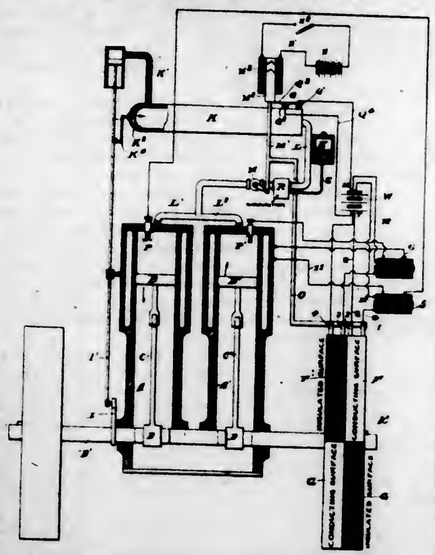
18. In a garment-supporter, the combination with a stud member, of a loop member coöperating therewith and formed of a single wire into a pair of tapering loop-sections disposed in angular relation and comprising spaced side elements, the inner of which are crossed, the inner side element of each section having a terminal eye

that is slidably engaged with the outer side element of the other section.

19. In a garment-supporter, the combination with a stud member comprising a base, a stud having side elements that are carried by the base and are movable toward and from each other, and a cushion covering said side elements, of a loop member comprising angularly-disposed loop-sections having inner and outer side elements arranged across each other and adapted to receive between them the stud of said stud member.

20. In a garment-supporter, the combination with a stud member, of a loop member coöperating therewith and comprising loop-sections located in different planes in angular relation to each other, said loop-sections swinging in their respective planes, on axes that intersect said planes, toward an alined position, when the stud is engaged in the sections.

809,211. **STARTING MEANS FOR GAS OR SIMILAR ENGINES.** FRANCIS L. ORR, Thurman, Iowa, assignor of one-half to Mark Morrow, Percival, Iowa. Filed Feb. 21, 1905. Serial No. 246,753.



Claim.—1. An explosive-engine starter, employing an air-storage tank, a carbureter, an air passage-way leading from the storage-tank, through the carbureter and into the combustion-chamber of the engine, means for re-storing the air-tank, means operating to arrest action of the storing means by pressure in the storage-tank, a spark-plug with battery and suitable electric circuit, for ignition of the explosive mixture in the engine combustion-chamber, a commutator device driven by the engine, a valve in the air passage-way leading from the storage-tank, a solenoid or similar device having electric supply and a cut-out, adapted for operating the said valve, brushes adapted for adjustment into circuit-closing contact with the commutator by operation of the solenoid, a normally open circuit-closer adapted for closure through operation of the solenoid, the spark-coil and battery being in electrical circuit with the commutator-brushes, the engine spark-plug, and the poles of the normally open circuit-closer, substantially as described.

2. The combination with an explosive-engine, having means for feeding explosive mixture thereinto, employing an air-storage tank, a carbureter connected thereto, and means adapted for automatically re-storing air in the tank, of a commutator device, brushes for contact with the commutator device, means employing a solenoid or similar device for adjustment of the commutator-brushes and the conjoint feed of explosive mixture into the engine, a battery and circuit having therein a suitable closer, for operation of the solenoid, a normally open circuit-closer adapted for momentary closure by operation of the solenoid, and a battery and spark-coil in electric circuit with the commutator-brushes, the engine spark-plug and the poles of the normally open circuit-closer, substantially as described.

3. The combination with an engine having a plurality of working cylinders, and a common power-shaft, of a circular commutator on the power-shaft, the outer periphery of the commutator being divided into sets of oppositely-located conductive and insulated surfaces, brushes adapted for adjustment into and out of contact with the commutator, means adapted to feed explosive mixture into the engine-cylinders and whereby adjustment of the commutator-brushes is effected, a normally open circuit-closer adapted for momentary closure, and electrical means for operating the same, which is also adapted for conjoint operation of the explosive-mixture-supply means, and a battery and spark-coils, in electrical circuit with the commutator-brushes, the spark-plugs in the engine-cylinders, and the poles of the normally open circuit-closer, substantially as described.

4. The combination with an explosive-engine, employing a spark-plug, a battery in electrical circuit with the spark-plug, and switches for closing and opening the battery-circuit, of a circuit employing a spark-coil, a commutator whereby the circuit is closed and opened, a normally open circuit-closer in the battery-circuit, a solenoid or similar device adapted for momentary closing of the normally open circuit-closer and also conjoint feed of explosive mixture to the engine, a battery in electric circuit with the solenoid, and a switch in the solenoid circuit, substantially as described.

809,212. **NON-REFILLABLE BOTTLE.** FREDERICK M. OSGOOD, Manchester, N. H. Filed Jan. 30, 1905. Serial No. 243,195.

Claim.—1. In a non-refillable bottle, a shell adapted to be inserted within the bottle-neck, said shell having exterior locking-flanges, a sleeve of packing material inserted between the shell and the bottle-neck, a transverse partition extending across the shell and provided with a port, a conical-shaped perforated partition beneath said transverse partition, a double cone-shaped buoyant valve beneath the inclined partition and controlling an inlet-port into the shell, a ball interposed between said valve and partition, a tubular member rising from the transverse partition and provided with lateral ports, and a valve controlling the outlet end of said tubular member.

2. A non-refillable bottle presenting a neck provided with two shoulders, a sleeve fitted within the bottle-neck and retained between said shoulders, said sleeve having a transverse partition provided with one or more ports, a vertical tubular member rising from the transverse partition and provided with lateral ports, a non-detachable valve controlling the outlet end of the tubular member, a cone-shaped perforated partition beneath the transverse partition, a buoyant valve beneath the cone-shaped partition, said valve controlling the inlet-port to the sleeve and a ball-weight interposed between the valve and cone-shaped partition.

809,213. **MEANS FOR SEALING BOTTLES.** FREDERICK M. OSGOOD, Manchester, N. H. Filed Mar. 20, 1905. Serial No. 250,906.

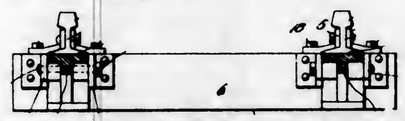
Claim.—1. A bottle the neck of which is provided with a groove, a cap to be placed over the bottle-neck, said cap having an interior inwardly-facing shoulder near its open end and a locking device presenting a resilient arm having a projection to enter said groove, the end of the arm being adapted to engage the shoulder in the cap and thereby lock the cap on the bottle-neck.

2. A bottle, the neck of which is provided with a groove, a cap to be placed over the bottle-neck, said cap having an interior, inwardly-facing shoulder near its open end, and a locking device comprising resilient arms having projections to enter said groove, the ends of the arms being adapted to engage the shoulder in the cap and thereby lock the cap on the bottle.

3. A bottle, the neck of which is provided with a groove, a breakable cap to be placed over the bottle-neck, said cap having an interior, inwardly-facing shoulder near its open end, and a locking device comprising resilient arms having projections to enter said groove, the ends of the arms being adapted to engage the shoulder in the cap and thereby lock the cap on the bottle.

4. A bottle, the neck of which is provided with a groove, a wooden cap to be placed over the bottle-neck, said cap having an interior, inwardly-facing shoulder near its open end, and a locking device comprising resilient arms having projections to enter said groove, the ends of the arms being adapted to engage the shoulder in the cap and thereby lock the cap on the bottle near its open end, said cap having a saw-cut in its opposite end.

809,214. **RAIL-SUPPORT.** FRANK C. PAINTER, Osman, Ill. Filed Sept. 2, 1905. Serial No. 276,817.



Claim.—1. The combination of the meeting ends of two railway-rails, ties for supporting the same, said ties being provided with supporting-plates and securing-brackets, and a bridge-piece adapted to be supported by said plates and secured in position by means of said brackets.

2. The combination of the meeting ends of two railway-rails, ties for supporting the same, said ties being provided with supporting-plates and angular securing-brackets, and a bridge-piece adapted to be supported by said plates and secured in position by said brackets.

3. The combination of the meeting ends of two railway-rails, ties for supporting the same, said ties being provided with supporting-plates and securing-brackets, a bridge-piece provided with downturned flanges adapted to rest upon said plate, and means for engaging the bridge-piece and said brackets.

4. The combination of the meeting ends of two railway-rails, ties for supporting the same, said ties being provided with supporting-plates and securing-brackets, a bridge-piece provided with downturned flanges adapted to rest upon said plates and with arcuate strengthening-ribs, and means passing through the bridge-piece and said brackets to secure the bridge-piece in position.

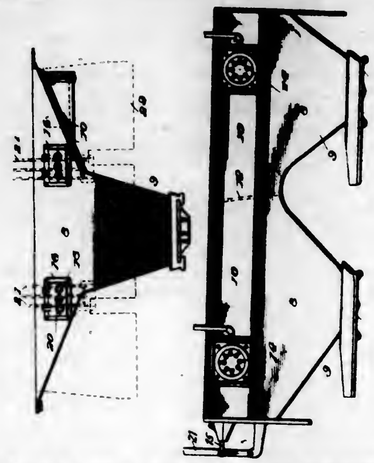
5. The combination of the meeting ends of two railway-rails, ties for supporting the same, said ties being provided with plates and securing-brackets, a bridge-piece having downturned flanges to rest upon said brackets, and projections, means passing through said projections and brackets to secure the bridge-piece in position, and an arcuate-shaped strengthening-rib secured to the bridge-piece and said downturned flanges.

6. The combination of the meeting ends of two railway-rails, metallic ties for supporting the same, said ties having formed integral supporting-plates and attached thereto supporting-brackets, cores of concrete for the ties, and a bride-piece supported by said plates and secured in applied position by said brackets.

809,215. **LOCOMOTIVE ASH-PIT AND BLOWER.** HENRY H. PARSON, New York, N. Y. Filed Jan. 14, 1904. Serial No. 189,009.

Claim.—1. In a locomotive, an ash-pit, a grate, levers for operating the grate, the ash-pit being provided with an opening through which the levers pass, a device for closing said opening comprising a fixed member to form a normal support for the levers and a hinged member resting on the levers and movable in unison therewith, whereby to prevent the escape of air in the operation of the levers.

2. In a locomotive, an ash-pit, a grate, levers for operating the grate, the ash-pit being provided with an opening through which the levers pass, a device for closing said opening comprising a fixed member provided with an extension, said extension forming a normal support for the levers and a hinged member provided with a corresponding extension and resting on the levers and moving in unison therewith, whereby the escape of air in the operation of the levers is prevented.



3. In a locomotive, an ash-pit, a grate, levers for operating the grate, the ash-pit being provided with an opening through which the levers pass, a device for closing said opening comprising a fixed member provided with an extension, said extension forming a normal support for the levers and a hinged member provided with a corresponding extension and resting on the levers and moving in unison therewith, said members being provided with registering notches through which the levers pass.

4. In a locomotive, a grate, an ash-pit arranged beneath the grate and closed air-tight except toward the grate, a blower in the ash-pit and a wind-shield for the blower supported by the ash-pit independent of the blower.

5. In a locomotive, a grate, an ash-pit arranged beneath the grate and closed air-tight except toward the grate, a blower in the ash-pit and a pair of wind-shields, one arranged in front of and the other in the rear of the blower, said wind-shields being carried by the ash-pit independent of the blower whereby a dead-air space is formed around the blower.

6. In a locomotive, a grate, a plurality of ash-pits arranged beneath the grate, each of said ash-pits being entirely independent and closed air-tight except toward the grate, a blower in each ash-pit and a wind-shield carried by the forward ash-pit, said wind-shield being entirely independent of the blower and adapted to shield the blower of each ash-pit.

7. In a locomotive, a grate, a plurality of ash-pits arranged beneath the grate, each of said ash-pits being entirely independent and closed air-tight except toward the grate, a blower in each ash-pit and a pair of wind-shields one arranged in front of the blowers and the other arranged behind the blowers, said shields being carried by the ash-pits entirely independent of the blowers and forming a dead-air space in which the blowers are located.

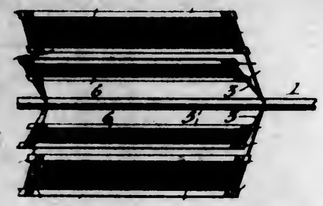
8. In a locomotive, a grate, an ash-pit arranged beneath the grate, closed air-tight except toward the grate, a blower in the ash-pit, a plate carried by the ash-pit and extending out at right angles to the side of the ash-pit to form a wind-shield for the blower.

9. In a locomotive, a grate, an ash-pit arranged beneath the grate, said ash-pit closed air-tight except toward the grate, a blower in the ash-pit and a pair of plates extending out at right angles to the sides of the ash-pit, one in front of the blower and the other in the rear thereof, said plates being independent of the blower and forming a dead-air space around the blower.

10. In a locomotive, a grate, an ash-pit, a blower in the ash-pit and a wind-shield separated from the blower and adapted to form a dead-air space around the blower.

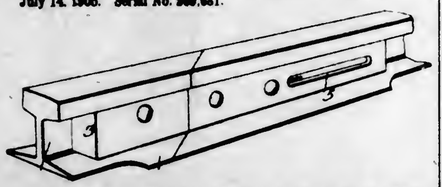
809,216. **HARVESTER-REEL.** JOSHUA PEARCE, Pickering, La. Filed Apr. 11, 1905. Serial No. 254,968.

Claim.—1. A reel-blade comprising arms, spaced strips connecting the arms, and a body of light material between the strips and clamped at its edges by the strips.



2. A reel-blade comprising arms, spaced strips provided with clips engaging the arms, each strip consisting of a folded piece of sheet metal, and a body of woven material filling the space between the strips and clamped at its edges between the folds thereof.

809,217. RAIL-JOINT. CLARENCE D. PETERS, Etherley, Ill. Filed July 14, 1905. Serial No. 269,681.



Claim.—1. In combination with the meeting ends of railway-rails, of wedge-blocks designed to be moved longitudinally of the rails without wedging action, means to move one of said blocks with relation to the other to produce a wedging action, and means to hold said blocks in wedging position.

2. In combination with the meeting ends of railroad-rails, of wedging-blocks designed to coöperate therewith and movable longitudinally of the rails, said blocks being formed with means arranged to register to permit their longitudinal movement, means arranged to register when said blocks are in wedging position, and means to coöperate with said last-mentioned means to lock the blocks in wedging position.

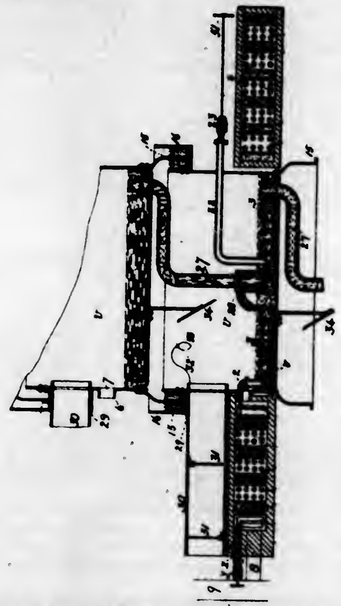
3. The combination with railroad-rails formed with registering housings at their meeting ends, wedge-blocks longitudinally movable in said housings, two sets of depressions formed in each wedge-block, the depressions of one set being in register in the respective blocks only when the blocks are in wedging position, and means to engage said registering depressions.

4. The combination with railroad-rails formed with housings adapted to longitudinally aline when the rails are in position, wedge-blocks seated in one housing and adapted to coöperate with the other, each of said wedge-blocks being formed with an operating depression adapted to aline with each other for the initial movement of the blocks, each of the blocks being formed with locking depressions normally out of register, said locking depressions registering only after the wedging action of the blocks, and means engaging the walls of the housing and said registering locking depressions.

5. The combination with railroad-rails formed with longitudinally-arranged housings at their meeting ends, of wedge-blocks normally within one housing and adapted to coöperate with the other, each of said wedge-blocks being formed with operating depressions and with locking depressions, said locking depressions being out of register in the respective blocks when the operating depressions thereof register, the walls of the housing being formed with longitudinally-arranged slots adapted to register with the operating depressions in the wedge-blocks.

809,218. APPARATUS FOR THE SEPARATION OF GASES FROM THEIR MIXTURES. RAOUL P. PICTET, Berlin, Germany. Filed May 24, 1901. Serial No. 61,720.

Claim.—1. In an apparatus for the separation of a gaseous mixture into its constituents by the liquefaction and subsequent evaporation or fractional distillation of such gaseous mixture in the manner hereinbefore described, the combination with a liquefier comprising a series of closed evaporator trays, troughs or sections, connected to permit passage of liquid through the series, and provided with conduits, in contact with liquid in such trays, for the passage of gas to be liquefied, and with separate gas-outlets, of a plurality of heat-exchangers, each having adjacent conduits for the passage of gas to be liquefied and for the gas escaping from the evaporator-trays, such conduits of the several exchangers being connected respectively to the corresponding conduits and outlets of different trays of the series; a source of supply of compressed gas to be liquefied, to which the corresponding conduits of the exchangers are connected in multiple, and means for collecting the liquefied mixture from the conduits of the several trays.



2. In an apparatus for the separation of a gaseous mixture into its constituents by the liquefaction and subsequent evaporation or fractional distillation of such gaseous mixture in the manner hereinbefore described, the combination with a liquefier comprising a series of closed evaporator trays, troughs or sections connected to permit passage of liquid through the series, but sealed against the passage of gas from one to the other, and provided with conduits, in contact with liquid in such trays, for the passage of the gas to be liquefied, and with separate gas-outlets, of a plurality of heat-exchangers, each having adjacent conduits for the passage of gas to be liquefied and for the gas escaping from the evaporator-trays, such conduits of the several exchangers being connected respectively to the corresponding conduits and outlets of different trays of the series; a source of supply of compressed gas to be liquefied, to which the corresponding conduits of the exchangers are connected in multiple, and means for collecting the liquefied mixture from the conduits of the several trays.

3. In an apparatus for the separation of a gaseous mixture into its constituents by the liquefaction and subsequent evaporation or fractional distillation of such gaseous mixture in the manner hereinbefore described, the combination, with a liquefier comprising a series of closed evaporator trays, troughs or sections, connected to permit passage of liquid through the series, and provided with conduits, in contact with liquid in such trays, for the passage of the gas to be liquefied, and with separate gas-outlets, of a plurality of heat-exchangers each having adjacent conduits for the passage of gas to be liquefied and for the gas escaping from the evaporator-trays, such conduits of the several exchangers being connected respectively to the corresponding conduits and outlets of different trays of the series; a source of supply of compressed gas to be liquefied to which the corresponding conduits of the exchangers are connected in multiple, means for collecting the liquefied mixture from the conduits of the several trays, and means for collecting the gases escaping from the several exchangers.

4. In an apparatus for the separation of a gaseous mixture into its constituents by the liquefaction and subsequent evaporation or
